Firemen, Brakemen, for railroads nearest their homes—everywhere; beginners $150-$250 monthly (which position?). RAILWAY ASSOCIATION, Desk W-5, Brooklyn, N. Y. 8-4

A Great Guernsey Producer

7,400 Pounds From One Cow and Seven Daughters

We are told that the average dairy cow produces about six living calves in her lifetime. From a comparative standpoint, then, the great reproducing record that has been made by the pure-bred Guernsey cow, Pride of Birth, is worthy of note in these columns. Not only has this cow produced eleven living calves, of which eight were females, but she and her progeny have made a list of fourteen Advanced Register records totaling 7,399.95 pounds.

Pride of Birth has two records, including one of 12,943.5 pounds milk and 641.12 pounds fat as a mature cow. Seven of her eight daughters also have at least one Advanced Register record, and the other is now on test. One of her daughters, Pride of Castle Haven, has three daughters and one son in the Advanced Register. Another daughter, Pride of Place, also has three daughters and one son in the Advanced Register.

Of her three sons, two are already in the Advanced Register. One of them, Falcon's Proud Warrior, is now in service in a Connecticut herd and has six Advanced Register daughters and eight more on test. Another son, Langwater Hornet, has five Advanced Register daughters and two more on test. Her third son, Gerar Uncle Jim, will also enter the Advanced Register within the next two years, so that Pride of Birth will then have every one of her eleven calves in the Advanced Register.

Pride of Birth was owned by several breeders during the fifteen years of her life. She was bred by H. McK. Twombly, New Jersey, and was later owned by J. L. Hope of the same state; O. A. Turner, Maryland; F. L. Ames, Massachusetts, and spent the last years of her life on the farm of Louis McL. Merryman, Maryland, where she died in 1923 at the age of nineteen years.—The American Guernsey Cattle Club.

State Guernsey Champion

The Pedigreed Seed Company of South Carolina owns Violet of Orchard Springs that has recently completed a record that makes her the state champion of class DD for the Guernsey breed, as well as making her the tenth highest producing Guernsey cow in the world in class DD. She produced 11,934.5 pounds milk and 680.92 pounds fat, with an average test of 5.71 per cent.—American Guernsey Cattle Club.

Breeding Experiment in California

A study of the methods used by practical breeders in their attempt to fix the transmission of high production in dairy cattle shows three methods that have been followed: (1) inbreeding, (2) linebreeding, and (3) outcrossing. Each method has its following. There are those who believe that to follow the method of linebreeding is to be insured of success, whereas to inbreed is to meet with certain disaster. There are others who think inbreeding the most successful method to follow, while others practice outcrossing.

The wild cow from which our present dairy cow descended gave very little milk, probably only enough to nourish her calf for two or three months at most. Through thousands of years of patient selection man has developed animals capable of giving great quantities of milk, until further progress can be made only with great difficulty.

Because of the fact that there is a tendency for the off-spring of high producing animals to revert in production towards the average of the breed, it is difficult to maintain the high production that has been developed in our better animals. Is there some method of breeding by the use of which a breeder may be insured that the daughters of his high producing animals will themselves, with a reasonable degree of certainty, be profitable animals? In other words, can we prevent this tendency to revert to the average of the breed? Is there any merit in any of the systems of breeding now being used? If so, which one of these is the best? Is there any other system that may be used?

These are some of the questions that the University of California, through its Department of Animal Husbandry, is attempting to answer for the dairy cattle breeders of the state in a breeding experiment that is now being carried on in co-operation with the Dairy Division of the United States Department of Agriculture.

The first part of this experiment is comparison of inbreeding to outcrossing as a means of fixing and insuring the transmission of high milk production. This experiment was started at the New Jersey Experiment Station in 1918. The cattle, thirty-two pure-bred Jerseys together with four years of data that have been collected on them, have been recently purchased by the University of California and the animals are now at Davis. The experiment started with three Jersey bulls and eighteen cows. These three bulls are unrelated. One of these, Lucky Fern, is a son of Lucky Farce, a cow that until recently held the world's record as a yearling. At present we have a number of his daughters which are about to freshen. The second bull is Pogis Torono Experimenter, a son of Hillside Emperor out of Hillside Torono. The other bull, Gravity's Exile of Lusscroft, is a son of Exile Bonnie Gold Bug by Options Pogis of Lusscroft.

The females of the Jersey group are divided into three groups. Each group is mated with one of these bulls. The females resulting from the first mating, or the first generation of female progeny of each bull, are bred directly back to their sires. The females resulting from his mating or the second generation of inbred animals will be mated again with her sire, giving the third generation of inbred females. These will contain 87.5 per cent of the blood of the sire. After the first generation of inbred animals has been mated back to the sires, in the next breeding they will be outcrossed on each of the other bulls in the experiment. Likewise the same comparison will be possible with the second and third generations.

The effect of these two methods of breeding will be determined by direct comparison. Three generations of inbred heifers will be compared with three generations of outcrossed heifers.

Complete records are being kept on every animal in the experiment. The effect of the different systems of breeding are noted by comparing:

1. The production of the animals. The amount of milk and the per cent of fat is taken daily for each cow.
2. Size and development. The animals are weighed and height measurements (at withers) are taken monthly from birth.
3. Constitutional vigor. Measurements of heart girth are taken monthly.
4. Reproduction. Complete breeding records are being kept including data on size and vigor of calves, age at sexual maturity, sterility, susceptibility to abortion, and sex ratios.
5. The general conformation of all animals is recorded by pictures.

In selecting the animals for the experiment care was taken to see that no animals showing any weakness whatever were used. No attempt will be made to select further as the experiment advances.

A similar experiment is being conducted by New Jersey Experiment Station in which linebreeding as a method of fixing and insuring the transmission of milk production is being compared with outcrossing. It is expected when these experiments are completed that some new information will be developed concerning the breeding of dairy cattle and it is hoped that this information may be of such a nature as to have a pratical application and simplify some of the problems relating to the breeding of dairy cattle.—W. M. REGAN, California College of Agriculture.

Ike: Why are you wearing so many coats on a hot day like this, Mike?

Mike (carryng a paint can): Why, I'm a-goin' ter paint me garage, begorra, and it says on the can here that to get the best results, a fellow should put on three coats.—Good Hardware.

Leaky Roofs

Made Water-tight for 10 Years

An amazingly simple way to make your leaky roofs watertight for 10 years at one-fifth the cost of a new roof. 30 years use on industrial buildings all over the world proves what it will do for you.

SEAL-TITE
TRADE MARK THICK LIQUID REGISTERED
ASBESTOS ROOFING

You pour it on right over the old roof and spread it out with a roofer's brush. You do it yourself in a few hours—no labor cost—you end your roof worries for 10 years to come.

Don't Pay for 4 Months!

We ask no pay till 4 months of sun and rain have proved all our claims. SEAL-TITE must do what we say it will or it costs you nothing. Could you make a fairer offer if you wrote it yourself?

WRITE NOW!

Our big, illustrated circular tells all about how you can turn an old, leaky roof into a new, watertight roof, guaranteed for 10 years, at a small fraction of the cost of a new roof. What a wonderful chance to save! Don't wait for the next rain to remind you that your roofs leak. Look into this thing right now. Send today for full details of our amazing offer. Write TODAY!

MONARCH PAINT COMPANY
W. 65th and Detroit Ave., Dept. 28-56 Cleveland, Ohio

REMEMBER, it's but a short distance from your cow's udder to the cream pitcher—the butter plate—the nursing bottle.

Keep her surroundings healthful, free from disease germs, and clean smelling, with Dr. Hess Dip and Disinfectant.

Provide a wallow for your hogs. To each 25 gallons of water, add about one quart of Dr. Hess Dip. Your hogs will do the rest. Good night lice and disease germs!

Use the sprinkling can—in the poultry-house for lice and mites, wherever there is filth or a foul odor.

A Healthy Mouth

If all people would only be sensible like our Dairyman family and not go crowding into the congested, unhealthful cities, it does begin to look as if the doctors would be able to get us all safely past our allotted three score years and ten and make us live any amount longer.

Of course there is no point in just barely cheating the grave till we are 110 or something like that, but I believe most people could just as well be alive and energetic and useful at 75 as to be sitting around waiting for their time to come, as so many do. Hardly a year passes now that something is not discovered that makes life not only longer but more enjoyable.

An elderly woman told me the other day that her grandfather had died of a mysterious disease originating in his mouth. He was a man of means and everything known at the time was tried. I suppose away back there they bled him one way and another until the poor man had no resistance left.

That same mouth disease was a mystery for hundreds of years. It began with tender, bleeding gums which got sorer and sorer until pus sacs were formed on them which discharged poison. This was carried through the body and poisoned it until the teeth dropped out and often the patient died. No need for it, but doctors simply didn't know what to do about it.

Nowdays we understand this disease called pyorrhea pretty well, thanks to the hard work of a good many scientific men. We know a lot about curing it but we know a great deal more about preventing it and that is the most important thing.

The disease starts from the tartar deposits on the teeth just at the margin of the gums. These deposits increase, irritate the gums, and eventually the disease progresses to the stage where pus deposits are formed. This is carried all through the body and poisons it.

It is really a very dirty disease. No cleanly person would put good food into a dirty dish and then expect to eat it, but thousands of people three times a day put food into mouths which, from the standpoint of bacteriology, are very, very dirty. It is like drinking polluted well water.

If you already have an advanced stage of pyorrhea there are two things to do. First, have a dentist clean and repair your teeth and then take care of them. You will find you have plenty of company for it is said that four out of five persons have the disease in this country. In most cases it is simply because they did not know how easy the prevention was.

The prevention consists of a semi-annual trip to the dentist (it is cheaper in the long run) and systematic care of the teeth. The latter is simple and consists only in a thorough cleaning night and morning. As in the case of any other disease the first thing is to get the body as a whole in the best condition possible.

In brushing your teeth be sure to use an up-and-down motion for the most part. It cleans them a world better than racing across them. Get a new brush before the old one has become too limp to be effective. Make sure that every child in the family has a brush and uses it.

Table salt is a fine thing to use as a dentifrice and many of our best dentists say it is superior to any paste or powder. Combined with soda in equal parts it is a good thing to use the last thing at night to counteract the mouth acids that work so hard while we sleep.

Salt has a tendency to harden the gums and keep them in good condition, only you must not use too much at a time for then it is irritating. Good circulation of blood through the gums is very important and can be helped by gentle massage with the finger tips.

In most cases health is just common sense with a little forethought and care. Many diseases come from bad teeth and we never know how many of these we are nipping in the bud when we keep our mouths in good condition.—LUCY THOMPSON.

Dog Days

This summer, in much of the United States, has been so cool and rainy that there is not likely to be the usual feeling about dog days. The weather may change, however, and I would like to put in a good word for our best animal friend, the dog.

He is no more a menace at one time of year than another if he is properly cared for. "Dog days" is a term that has no special significance in the minds of persons who think, while to the superstitious it means mad dogs, fevers, and possibilities of bad luck without end. These days have no definite onset but range from the first of July to some time in September and are so called from the ascendency of the dog star.

It is true that the weather may become very sultry and trying for both beasts and men but if we will only put ourselves, as nearly as possible, in the place of our animals we will at least see that their food is right and more especially that they have plenty of good, fresh water.

I have often heard men argue that because a horse refused water when it was offered it the first thing in the morning, it didn't need to be offered it later in the day. They never think to apply that reasoning to themselves.

The nicest dog I ever had as a child was an old black fellow named Mike. One day Neighbor Higdon came driving past just as Mike appeared in our front yard acting in such a way, I must admit, as to scare most anyone. He howled, he leaped into the air, he foamed a little at the mouth, and he kept running to my father with a most appealing look.

Father had the presence of mind to examine him and found that in nipping at the flies the dog had accidentally caught a bee which was stinging and buzzing unmercifully in his mouth.

The neighbor stopped to watch affairs and was told the cause of all the fuss. But he was a firm adherent of superstition and, as we were in the midst of dog days, he was sure old Mike was mad in spite of a quick return to his former dignified ways.

A few days passed and as my father showed no intention of killing the dog, Neighbor Higdon decided that as a means of protecting the community he had better do it and sure enough he did. Dog days never roll around that I do not remember the hideous injustice done my old playmate by that stubbornly superstitious man.

There are, of course, some true cases of hydrophobia and it is foolish to let any animal endanger the lives of human beings but it is also unfair not to surround animals with all the safeguards possible. Dogs cannot ask for a drink so let us do the kind thing and give it to them.—LUCY THOMPSON.

Cleaning the Teakettle

If you live where the water is very hard, as I do, your teakettle is constantly accumulating a deposit of alkali. I clean mine by setting it empty on the stove and leaving it there until it is crackling hot. Then I dash in quickly some cold water and you should hear the lime coming loose. After this I can take out quantities of it.

My teakettle is aluminum but my neighbor says that she uses the same method with hers which is granite and has no trouble with chipping the outside.—LUCY THOMPSON.

A Double Lesson

If your chickens just will not learn to keep out of the way of speeding autos which insist upon running over them, you might kill two birds with one stone yourself as a man I heard of did recently.

I am not saying that this is a true story but some one told me that this man had just bought a new car and that he was having a hard time learn-

(Continued on next page)

Fall and Winter Fashion Magazine

This reproduction of the front cover of the Fall & Winter Fashion Magazine shows the three styles on which special dressmaking lessons are given. These lessons are fully illustrated and show just how the material should be cut and how the pieces of the garment should be sewed together. The dress, child's dress, and blouse could be made by a beginner with the help of these lessons.

In addition there are a number of new embroidery designs, a spread of Xmas gifts which can be made at home, and about 300 styles in the new Fashion Magazine. The styles are simple and up-to-date—Paris and New York designs modified just enough to enable the amateur dressmaker to make them easily. This book is worth many times its price to you, so send 10 cents for your copy today. The embroidery patterns are 15 cents each. Address Fashion Department, Hoard's Dairyman, Fort Atkinson, Wisconsin.

Miscellaneous Fashions

No. 2149—Becoming One-piece Frock. C in sizes 16 years, 36, 38, 40, and 42 inch bust measure. Size 36 requires 3⅝ yards 4 inch material with 1 yard 36-inch contrastin

How to Order Patterns

Enclose 10c in stamps or coins (wrap co carefully) for each pattern ordered. Se your order to Fashion Department, Hoar Dairyman, Fort Atkinson, Wis. Every p tern is seam-allowing and guaranteed to perfectly. Do not fail to state size.

Remember that unbroken black very hard to wear next to the fac white or a becoming color should se arate the face and the black. Th exception is the striking blonde- brunette with vivid coloring.

Super Zinc-ed

WIRE FENCES

"Super-Zinced" Fences are protected against rust by an extra heavy and well bonded coating of zinc that will not crack or peel. The zinc is applied by our improved process which is the successful result of years of effort to produce better and more durable fences.

Columbia Fence

is made with the well known Columbia Hinge-Joint; its natural strength together with its "Super-Zinced" rust protection affords practically a permanent inclosure. It establishes a new standard of fence service and durability. All of our fences are now "Super-Zinced," yet *cost no more* than fences of ordinary galvanizing quality.

FREE—Send for Farmer's Handy Manual of account, crop record and memorandum pages, also catalogue describing our Columbia and Pittsburgh Perfect "Super-Zinced" Farm, Poultry and Lawn Fences.

ing to run it properly. Also that he was having all sorts of grief from having his chickens run over by passing cars.

One day he had a bright idea. He got his car and all his chickens into a rather small enclosure and then he spent the day charging at them, backing, turning, and charging again.

"Gives me good practice on the car," he said, "and then it teaches those derned chickens to look out for themselves."—LUCY THOMPSON.

Feeding the Family

New Department of National Dairy Exposition

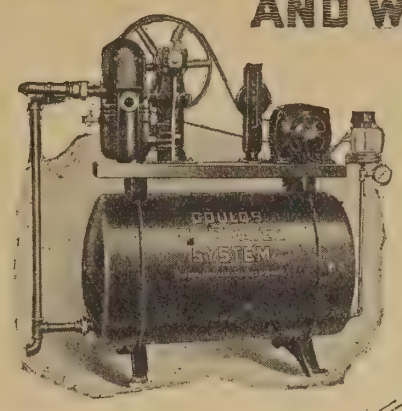
The homemaker's interest and that of the dairy industry meet in the problems of feeding the family wisely for health and growth. In recognition of this fact, the National Dairy Exposition is this year organizing a Consumers' Department under the heading of Feeding the Family Exhibits, Contests, and Conference.

Prizes will be offered for the preparation of attractive wholesome food dishes, prepared from various milk products; for daily menus arranged for the family with growing children, and for the family whose men folks are engaged in active manual labor as is the farmer and the factory worker.

Conferences will be addressed by influential authorities on the problems of choice and preparation of foods for the family. Pre-natal feeding, food for the pre-school age, foods for the lunch box, and foods for mother and children who don't like milk are but a few of the problems that will be discussed in demonstrations and conferences.

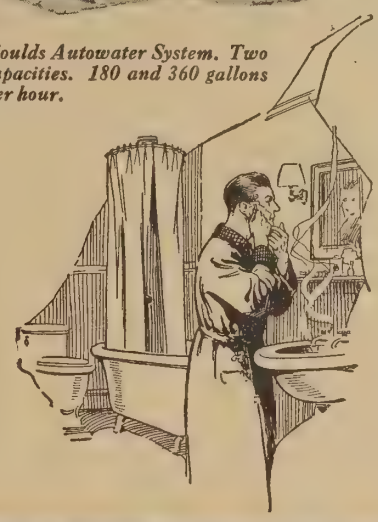
The Milwaukee milk producers and distributors, Milwaukee ice cream manufacturers, Milwaukee County Guernsey milk producers, The National Evaporated Milk Association, and The American Bakers' Association will all have exhibits arranged for the interests of the homemaker. Demonstrations in the preparation of unusual and attractive dishes will be featured in practically all of these exhibits.

The U. S. Children's Bureau, The National Dairy Council, Wisconsin University, State, County, and City Health Departments and a score of educational agencies including school and welfare organizations will present those parts of their various activities which relate to diet, recognizing that any wise diet includes the use of dairy products.



Those women readers of Hoard's Dairyman who find it possible to take a vacation and attend the Feeding the Family Exposition, September 27th to October 4th, will find a unique group of exhibits arranged for their particular service. Cattle breeders, dairy products manufacturers, go to such expositions to meet influential leaders and to see those things which will help them solve their daily problem. Here is an opportunity for the homemaker to find help and see interesting things intimately related to her problem of successfully feeding the family and reducing the number of undernourished children. "Skinny Kids" are pretty apt to be so because they don't eat wisely. Some of these exhibits will illustrate solutions of this perplexing problem.

H. E. VAN NORMAN.



To make salted nuts shell nuts and place them in a pan. Salt and dot with butter. Place in hot oven. Stir occasionally until they are evenly browned.

Aunt Ada's Axioms: A real welcome is half the dinner.

GOULDS PUMPS AND WATER SYSTEMS

Goulds Autowater System. Two capacities. 180 and 360 gallons per hour.

Comfort—from Running Water

A Goulds Autowater system puts comfort into country life.

This simple and inexpensive water system brings every convenience to the bath, kitchen, laundry, garage and grounds that a city water supply can give. With it suburban homes, farms, summer cottages and camps can have running water every day, 24 hours a day, without lifting a finger.

The Autowater is an independent automatic electric driven unit, assembled and ready for use.

Every home and farm has its individual water problem. Bring yours to Goulds or to a Goulds dealer. Our advice is yours for the asking. It has saved money for thousands of customers.

Goulds Pumps and Water Systems are of many types, sizes and capacities, adapted to every demand for the home or farm.

Write for booklet giving details of our complete line of electric and engine driven pumps and water systems for every need.

Feed NOW for Next Winter's Milk!

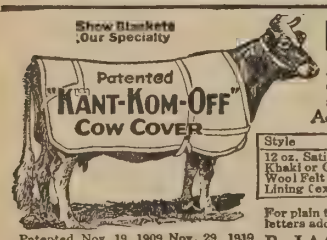
Pasture alone means underfed cows
Grain feeding with pasture pays!

With 2% Bone—Building Mineral

Grass is practically hay with water in it. No farmer would try to keep cows on moist hay all winter. Yet, without grain that is about all the cow gets in summer. And that means scanty milk flows next winter. Stop it! A small ration of International Special Dairy Feed in addition to grass will work wonders. It will maintain the milk flow and send the cows to the barn this fall in tip-top condition. Try it.

International Special Dairy Feed

"Twenty extra quarts from every sack"



Cow testing authorities and leading dairymen everywhere know the value of summer feeding. One farmer wrote that he increased his milk production 40% through summer feeding. If you want a much larger milk check next winter invest a little money in International Special Dairy Feed *now*. Thousands of farmers—men just as smart as you—feed International Special Dairy Feed and get 20 extra quarts of milk from every sack. They do it and we *guarantee* it.

Buy Now! If your cows have been on pasture alone or pasture and ordinary feed, then start them on International Special Dairy right away. The results will startle you. Dealers nearly everywhere sell this quality feed. If yours does not, write us. Milk means money. Get more milk! Use International Special Dairy Feed.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Kimble's Views Criticised

HOARD'S DAIRYMAN:—The article by Howard Kimble of Minnesota contains much good information. It shows he is a thinker on farm problems as well as on those things affecting directly and indirectly the farmers' income. He, like many other writers, cites that there is a disparity in prices between what the farmer sells and what he purchases, but he offers no definite solution. It would have appealed to me more if he had condemned the reclamation of much of our land when we are already producing more than the farmers can sell at reasonable prices. Most writers seem to be afraid to state that we have an overproduction and are going all around Robin Hood's barn to search for something, they know not what, to save the farmer when he produces too much. If the farmers of this country knew cost of production there would be little or no danger of overproduction.

The boll weevil has been a larger factor in raising the price of cotton in the South than all other forces combined. He has cut the cotton crops beyond the demand of the world and cotton is selling at good prices.

It is not my idea that low production per acre is the solution of the farmer's problem. Whatever acres we operate, we should aim to get good production but much of our land that has been brought under cultivation in recent years would have been better left for the future generations to open up. The boll weevil does demonstrate, however, that when there is a shortage of production the prices rise. Let us nail this as being one of the factors in solving the farmer's problem.

I do not know what Congress can do to help the farmers when they will settle upon land which is unprofitable to operate, or when they grow more crops than the market will absorb at a reasonable price.

Mr. Kimble makes one or two statements which, it seems to me, are not wholly accurate. He says the railroads are guaranteed a profit. Who guarantees this profit? If I am correctly informed, several railroads have never paid any dividends to their stockholders, and some of the largest railroads have paid no dividends in the past eight or ten years. If the railroads are guaranteed a profit, how does it come that so many roads are not paying their stockholders any dividends?

I do not know whether it is true or not that many of the manufacturers of farm machinery are selling their machinery cheaper abroad than at home. If it is true, it may be an advantage to the farmers of this country for it is quite possible that the machinery which they do buy is sold at a lower price because the factories have run full capacity and the European market has taken care of the surplus. Moreover, keeping the laborers in these institutions constantly employed causes them to buy more farm products. It seems to me that we shouldn't criticize this when our machinery is not costing us relatively as much as it did in 1913.

I feel that one of the things which co-operative enterprises could do that would help agriculture is to handle the surplus farm products in the same way that manufacturers of machinery handle their surplus products. It doesn't seem to me wise to ask the government to do this but it is good business for farm co-operative enterprises to market the surplus farm products in foreign countries.

Illinois. R. T. S.

Two Words Tell it All

HOARD'S DAIRYMAN:—Seeing another teat puller in the field who seems dissatisfied with fellow dairymen who see fit to sell their products co-operatively, thereby becoming an advantage to him, he seems anxious to convince them of their folly, to induce them to reform, and come back with him and become "just a New York State farmer". Go back to the days when we were all independent teat pullers, who walked alone, signed a contract to deliver milk to the condensing company for 80 cents per 100 lbs. in June, advancing gradually to the summit of $1.25.

Sixty or seventy years ago wage earners received 75c to $1.25 per day also, and on public work were not always sure of their pay. I need not state the contract that has developed to present time. Neither is it necessary to dwell upon the evolutionary forces which have wrought this change in favor of the laborer. Organization, co-operation—two words—tell it all.

Employers of labor pay larger salaries to strike breakers than union men demand in numberless cases but organized labor has perfected their association to such a degree that the "scab" is largely eliminated.

Let Mr. T. P. change business and undertake to work independently among the labor poolers, then report the boast of larger remuneration. I'd advise his working in or near a hospital.

Well! Well! Now you do indeed speak as a brother. Indeed, on this ground all men are brothers. It is a pity about mistakes. Were it not for mistakes co-operative marketing would have swept all other methods out of existence far more completely than the fondest dreamer ever dreamed. Another great handicap is the wolf will creep into the fold. However, no advance has ever been made without being handicapped by mistakes, yet union labor is a success (sometimes a howling one) despite many mistakes to date. The shepherds did not quit because of the wolf, but increased their vigilance. In too many enterprises good business has failed because of incompetent managers but I believe more often by denying men who have only their own interests to further. Labor has overcome these obstacles; why cannot farmers? Above all, put none but men of proven integrity on guard.

Now brother T. P., if you do not want to progress, why be a bawler? It is written "Better cure one ill than rail at a thousand." Again, and in conclusion, why not sign your own name when you write to us or better yet have your picture in the paper. We might all get a better idea of what's the matter with dairy business down there than from anything you can write.

Wisconsin. JOHN O'CONNOR.

An old Spanish proverb says that "Hurry is the devil". Keeping serene will go a long way toward preventing fatigue, and will make it possible to accomplish more than could be done "on the run".

The Third Milking

HOARD'S DAIRYMAN:—Hoping it may be of interest to the average Hoard's Dairyman reader, I am giving results of three milkings a day, compared with two milkings, on common cows, such as the man starting in to dairy on borrowed capital is apt to have. Bear in mind that these results represent ordinary herd conditions, and were obtained by a man farming 120 acres alone, and handling a dairy of eight to eleven cows.

Since I was farming on shares, such a project as introducing an extra milking a day meant that I had to furnish the extra labor myself, and got for it only half the additional income. But whether it paid or will pay the average farmer is a question to be settled individually. The length of time cows have been milking, ratio between price of feeds and milk, and price and adaptability of labor, all are factors directly affecting the advisability of this winter practice.

Late in October, 1921, I bought eight cows. These cows cost me $30 each less than good grade cows were selling for at that time. But, as I had my own testing outfit and milk scales, I planned to take a chance on these culls, and kick out the boarders. They fooled me by paying for themselves with their first 3½ months' milk. Five of them were milking by Nov. 21 and results from these are all I have included in my first computation. The other three that freshened during the winter profited more by the extra milking than these five, for they had the advantage of it from the day they calved, for some of the five had been fresh over a month when the extra milking was introduced.

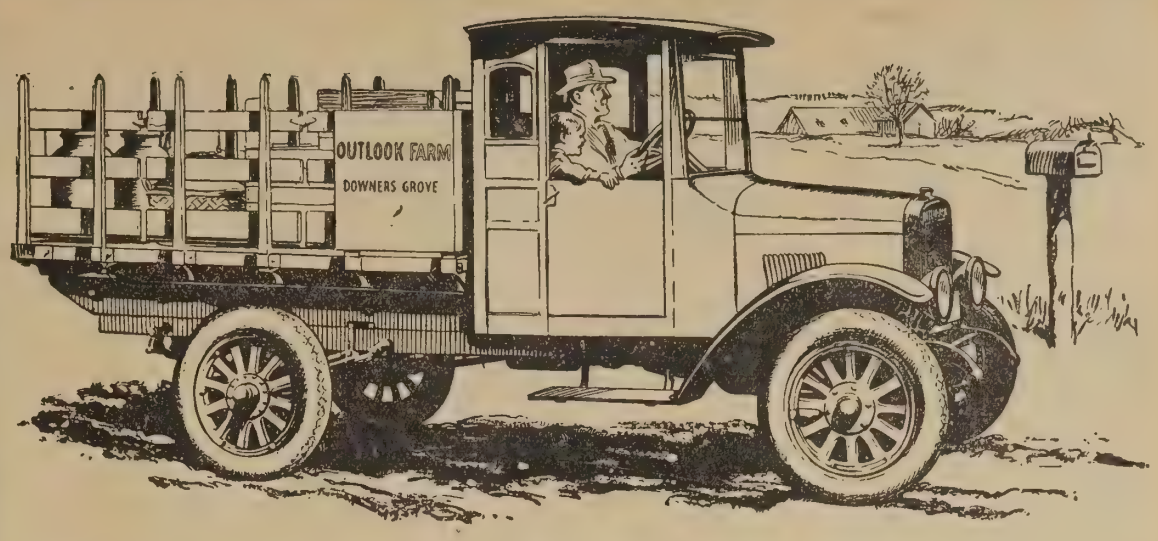
My milking hours were 4:30 a. m., 12:30 m., and 8:00 p. m. When on three milkings, I fed silage and grain immediately after each milking. I fed the same amount each 24 hours that they had received before, but divided it into three parts. Then, after the cows made a gain of several pounds of milk each, I increased their grain in proportion to the increased milk flow. Their feed consisted of fair corn silage, good clover hay, ground corn and oats, bran, and oil meal, in proportions to suit the needs of each individual. The average mixture of grain was 4 parts corn and cob meal, 3 parts ground oats, 1.5 parts bran, and .75 part oil meal, one pound of grain to each 3.5 lbs. of milk. Three light feeds of silage and grain each day instead of two heavy ones, placed a more even demand on their digestion, in the same manner that three lighter milkings stimulated the milk producing organs to more even natural conditions. Calves running with cows in a native or wild state nurse frequently. Our taking away a veal calf from its mother's side and putting her at once on two milkings a day is a rude shock to her udder capacity.

On twice a day milking during the last of November the five cows then milking produced an average of 35.1 lbs. milk each daily. On three times a day milking a week later they produced an average of 39.2, while three months later they were still producing 36.3 lbs. milk daily. They were then changed to twice a day milking and inside of a week had dropped to 31.6 lbs. The following table shows the variation for each cow:

Number cows	Nov. 30 two milkings	Dec. 6 three milkings	March 3 three milkings	March 10 two milkings
	lbs.	lbs.	lbs.	lbs.
1	25.3	27.2	24.5	22.3
2	23.4	26.9	26.0	24.0
3	35.5	41.5	41.0	35.0
4	51.5	56.5	52.0	44.0
5	39.6	44.0	38.0	32.8
Totals	175.3	196.1	181.5	158.1

The pounds of milk in each column of my table represent the average production for a three-day period on my milk-sheet. The totals tell the story, for it is the average of averages that counts. A gain of 21 lbs. of milk a day on five cows did not seem like so much in one day, but it became accumulative in this way. After my spring work was on and pasture time came, these cows milked like fresh cows after they had been in calf an average of 6 months and were all with calf again. Their sustained production all through the rest of that lactation period, the development of feeding and udder capacity, and their general good health brought as large an indirect or subsequent return from the extra milking as the additional milk obtained at the time.

In January, 1924, I started the extra milking again on four cows that had previously averaged 40 lbs. each on twice a day milking. After being milked three times daily for ten days these cows raised their average production to 44.3 lbs. The milk strike came on then and I discontinued the extra milking.



My trials convince me that three times a day milking is a good way to develop young cows and is practical when one has several good cows freshening close together in the late fall or early winter.

Illinois. LUMAN W. COLTON.

World's Biggest Dairy Cow

The "world's largest dairy cow", Wisconsin Fobes 5th, will be one of the prize exhibits at the National Dairy Show when it opens its doors in Milwaukee, Wis., on Sept. 27. This animal is a "tonner" which tips the beam at 2,240 lbs. She is one of the attractions at the Murphy Farms, owned by E. N. Murphy of Wisconsin. The big Holstein has a milk record of 25,617.20 lbs., with a fat mark of 863.2 lbs. in 305 days. Several of her progeny have set marks as sires.

Uncle Ab says he's generally found that silence is better than what some folks call "bein' real frank".

FARM HAULING *by* MOTOR TRUCK

FARMERS in every section are turning their hauling over to good motor trucks. There are plenty of practical reasons for the change.

The motor truck owner saves hundreds of hours per year and that means saving expensive labor for productive work at home. The automobile has shown him how to cut time and distance. Concrete and other hard roads are ready for his fast hauling. Distant markets are in easy reach. He is able to sell where prices favor him, and to buy likewise. In marketing his crops he cuts two days of old-style plodding down to a half day. Whatever he hauls—milk and cream, garden truck, live stock, fruit, grain and hay, sand and gravel, etc.—he does it *easier* and *cheaper* by motor truck.

In the full line of International Motor Trucks is a size and style to fit every farmer's needs. All sturdily built for hard, all-around farm use. Plenty of surplus power for heavy going.

The Speed Truck shown above carries a ton load easily and quickly. It is equipped with electric lights and starter, power tire pump, truck cord tires; special farm bodies available for your particular needs. The Speed Truck makes an excellent all-purpose truck for the average farmer. Where larger loads must be hauled, heavy-duty Internationals may be had for loads up to 10,000 pounds [max. cap.]. Let us tell you how conveniently you can secure an International Motor Truck. A letter will bring complete information.

POULTRY On The DAIRY FARM

J. B. HAYES

Ventilation

The gable roof, straw loft house has a number of advantages that have made it a successful type of building to operate under either hot or cold conditions. The construction is relatively cheap and the pack is of untold benefit in giving good ventilation during the winter and keeping the house cooler during the summer. It has been claimed that this building is ten degrees cooler during the summer than the shed roof.

In this particular house there is a front and rear elevation of 8 feet with the ridge of the roof running east and west. A south elevation of the windows permits the distribution of sunlight to the rear of the house and allows the caretaker to work in comfort.

Since a uniform temperature is desired, it is necessary to increase the insulation over the roosting section. With this idea a false ceiling of 1x4-inch stuff is made that drops to five feet at the rear. This ceiling has about two-inch spaces between the strips to permit the air to move upward readily. Over this ceiling a heavy layer of straw is placed. With the sloping ceiling, there is a three-foot additional amount of straw over the roosting section that conserves the warmth for the flock while roosting.

With the bafflers on the south side, between the windows, exchange of air is allowed. During a cold spell frost will collect on the roof boards but is not a disadvantage because of the heavy straw pack insulation which separates it from the house. On a mild day when thawing is expected, the wooden door on either end of the gable should be opened. This acts as a force draft that will remove the moisture, prevent it dripping on the straw, and will promote dryness.

Dust will collect in the straw, it is true, but is a minor fault if the house will operate properly in other respects. No fear of mites need be anticipated when the roosts and nests are properly treated each year. A yearly change of straw is not necessary for that same supply can remain year after year.

About one square foot of glass is required for every 10 square feet of floor space. In most cases all of this glass is placed on the south side but many people, in addition, place small sash along the north side below the dropping board. This arrangement will prevent the litter collecting in this section and will give a more uniform distribution, for the hens face toward the light when scratching. The windows will also help in giving better summer ventilation but should be covered with storm sash during the winter. As noted in the plans, the sash are placed about two and one-half feet from the floor and continue up to about the plate. An abundance of sunshine over the entire floor is assured in this manner.

The windows should be hinged so that they can be opened during the day when additional ventilation is desired. It is almost impossible to properly ventilate if the windows are set into the frame permanently. During the summer both the windows and bafflers should be removed. Inch mesh wire over the outside of the window frames will prevent the entrance of sparrows.

The lath baffler that is recommended is of ordinary building lath construction. A frame that will fit the space allowed between the windows is made and across this frame lath are nailed with a three-eighth inch space between the lath. After this row is completed a lath is nailed up and down at each side and a second row of lath nailed across. The joints are broken so that the center of the upper lath is opposite the center of the space allowed between the lower layer of lath. This arrangement allows air to enter but breaks the draft. With this combination of fresh air and open windows during the warmest part of the day, one can retain a fairly uniform temperature.

In some of the colder sections of the state it has been found advisable to use a building paper frame on the inside of this baffler during sudden, severe cold spells to decrease the ventilation. One must be careful about the distance that is allowed between the lath and between the layers as this proportion, which is about the thickness of a lath, controls the rate at which the air enters. In the cases where too much space is allowed the house cooled down too rapidly and also allowed a draft on the birds.

When the windows are opened for about an hour during the middle of the day, the house has an excellent opportunity to thoroughly air out, prevents a sudden raising temperature through the glass, and when the windows are closed the lath baffler allows a slow movement of air into the house. At this time it does not seem to be so much of a question of temperature in the house as it does a uniform temperature to which the birds can become accustomed and feel comfortable.

FOR SALE—Jersey Bulls

Of serviceable age and a few bull calves. Raleigh and Eminent breeding. Register of Merit dams. Federal Accredited. Choice individuals. Just a few real good ones to offer. Write

ROLLA OLIVER, Route No. 5, Independence, Mo.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Colic

Have a large mare I have had for several years that has what the veterinarian I employ says is spasmodic colic quite often. She has come out of it all right thus far though attacks are more severe. Has had two attacks within six weeks. Is there any way to prevent it? Feed nothing but good oats,, oil meal, and bran, and bright hay.

Cantreville, Tenn. N. H.

Omit oil meal from the ration and feed a mixture of crushed oats and one-ninth part of wheat bran by weight. Give it from a large shallow box to prevent bolting. Allow access to rock salt or block salt. One pound of the grain mixture for each 100 lbs. of body weight, given in 3 feeds, will suffice as a day's ration. Allow a similar amount of hay, but give most of it in the evening and none at noon when the mare has to work hard. Have her teeth put in order by a veterinarian. Make no sudden changes of feed and let the mare cool and rest before feeding when hot and tired.

Falling of Hair

What should cause sows to lose their hair after weaning their pigs? Apparently there is nothing else wrong with them. They are running in a pasture of sweet clover and are being fed skimmilk with ground wheat.

Brooks, Mont. E. A. L.

We think it likely that wetting in the rank, green crop and then scalding in the hot sun may be the cause of falling of hair and soreness of the skin. Bathing the skin with fresh buttermilk once or twice daily is effective when scalding starts. For a time better keep the sows out of the sweet clover field. Rape is more likely to induce sun-scald. Also stop feeding ground wheat and substitute wheat middlings, ground barley, and a little oil meal. Keep the sows out of dirty or stagnant water and mud wallows, but allow bathing in clean water.

Cause of Lice

What causes lice on cattle?

Hartland, Wis. E. J. M.

Cattle contract lice from coming in contact with an infested animal or occupying a stable that has been contaminated by such an animal. The vermin are most prevalent and troublesome during the winter season. Isolate affected cattle and spray or dip them with a solution of coal tar dip made and used according to directions given by the manufacturer or dust infested parts freely with powdered sabadilla, blanket the animal, and brush clean out of doors 3 or 4 hours later. Repeat the application when seen to be necessary. Cleanse, disinfect, and whitewash the stables.

Bags make good toweling

wont harden

Beware of salt that hardens! It causes "salt crust"—spoils meat cure. Colonial Special Farmer's Salt wont harden. Its soft, porous, irregular shaped flakes wont cement together in wasteful lumps.

no salt crust

Salt crust is simply undissolved salt. Colonial Special Farmer's Salt doesn't form salt crust because it dissolves completely. In dry or brine curing no crust can form to stop the cure.

melts *like a snowflake*

The action of salt depends on its dissolving completely. Each flake of Colonial Special Farmer's Salt dissolves instantly and completely. The cure penetrates evenly to the very heart of the meat.

***for* stock feeding**

Colonial Special Farmer's Salt is the best salt. Mixes thoroughly with dry feeds and its soft, porous flakes wont sift out. Keep an additional supply before stock at all times. It never causes sore tongues.

Write for our book, "New Truth About Salt."

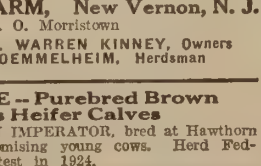
Seitz Ayrshire Wins Silver Medal

Cavalier's Messalliance owned by Adam Seitz & Sons of Wisconsin has just completed a Roll of Honor record of 11,895 lbs. milk, 421.70 lbs. fat in 300 days; carrying a living calf 184 days of this period. This makes her one of the silver medal cows of the breed, as well as Roll of Honor senior two-year-old champion of the Badger State.



In the 365-day division, for the Advanced Registry, she is credited with the good yield of 12,943 lbs. milk, 471.07 lbs. fat, thereby winning the class championship in this division for the State.—Ayrshire Breeders' Association.

The grammar lesson proceeded smoothly enough until the teacher asked a small boy what kind of a noun "trousers" was.

"It's an uncommon noun," was the reply, "because it's singular at the top and plural at the bottom."—Good Hardware.

BROWN SWISS

SWISS VALLEY GIRL 7TH NO. 4678

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

BROWN SWISS CATTLE BREEDERS' ASS'N
IRA INMAN, Secretary, Beloit, Wis.
A. E. BOWER, Pres., Union Stock Yds., Cleveland, Ohio

ANNOUNCEMENT

KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Herd fully accredited, Certificate number 65301

50 GRADE HEIFERS---Priced to Sell!

REGISTERED COWS and BULLS FOR SALE

We have at Larsen's Fern-Dell Farm a herd of 100 pure-bred and 200 high grade Guernseys. This is a herd where cows must be profitable producers,—one grade produced 17,555 lbs. milk, 887 lbs. fat in a year.

We now have for sale 50 grade heifers, many bred for early fall freshening, all from good producing dams. Will also price a few pure-bred females of milking age. The bulls we offer are from a few weeks to 14 months old and from A. R. dams. Wire us before you come so we can meet you.

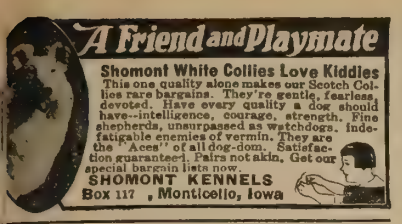
LARSEN'S FERN-DELL DAIRY FARM, A. W. FOX, Mgr., ONEIDA, WIS

EL JANE GUERNSEYS

ARCADIA, MISSOURI
(85 miles south of St. Louis)

Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.

Mr. Farmer, Dairyman, or Breeder, anywhere, take notice!



BULL SALE — Since our last dispersal of bulls we have accumulated 7 that are now ready for any kind of service. We also have 6 calves. These animals are from high producing dams with records. Ten of these animals will go well in show ring. You will want one for fall service. We want to dispose of them NOW. Tell us the age you want, what you want to pay. We will send you pedigree and price list. Our proposition is 25% discount next thirty days on serviceable bulls, and 20% discount on calves. Also have several well bred young cows. Let us both make some money by buying NOW at the right price.

Federal Accredited EL JANE FARMS, - Arcadia, Missouri

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.

A YEARLY RECORD BULL— Ready for Heavy Service

SIR WALKER SEGIS LYONS was born Feb. 19, '22. He is well grown and a good individual. His dam produced 20718 lbs. milk, 823.86 lbs. butter in a year as a 2-year-old. His sire by Piebe Laura Ollie Homestead King is from a 1230-lb. dam with 30814 lbs. milk. Write today for further details if you want a sire with the best of breeding and production. You'll find the price very reasonable.

CARLETON COLLEGE FARMS, Northfield, Minn.
FEDERAL ACCREDITED HERD

A YEARLY RECORD BULL --- Ready for Heavy Service!

BORN JANUARY 23, 1923

We offer one of the good sons of SIR WALKER SEGIS HOMESTEAD, (a proven show bull with 32 A. R. O. daughters) who is a son of "PIEBE" out of a 1230-lb. world record daughter of "COUNT." His dam as a three year old heifer made 20853 lbs. milk and 753 lbs. butter in 305 days. The two nearest dams of this bull average 991 lbs. butter on long time test. He is quite dark in color, a good individual and priced for a quick sale. Send for pedigree and photo.

BANK OF SOMERSET

SOMERSET, WISCONSIN

April 7, 1924.

Washburn Crosby Co.,
Minneapolis, Minn.

Gentlemen:-

Pursuant to a request of your Mr. W.G.Haertel as to our success with your Gold Medal Vitamin Dairy Ration, I submit the following as the result of our experience with our herd of Pure Bred and Grade Holstein Friesian cows.

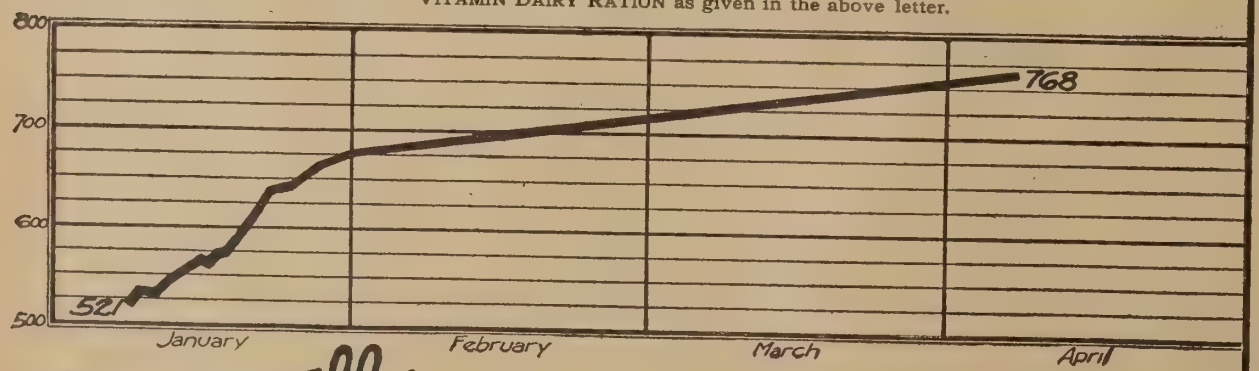
On January 7th, 1924 we commenced to feed your Gold Medal Vitamin Dairy Ration to our herd, feeding one pound of the feed for every three pounds of milk produced, along with twelve pounds of clover hay and thirty five pounds of silage per day.

Prior to feeding your feed we were feeding the same amount of hay and silage and also one pound of the following feed to every pound of milk produced.

500# of Bran
300# of Ground oats
200# of Ground Corn
100# of Linseed meal

At the time we started to feed your Dairy Ration our herd of 20 cows were giving 521# of milk per day, the cows being at different periods of lactation. The following is the record of our milk sheet, conditions remaining equal except for the change of feed.

Pounds of Milk Produced			
Jan. 7, 1924	521	Jan.19,1924	592
8	533	20	606
9	531	21	619
10	530	22	634
11	546	23	637
12	549	24	641
13	554	25	647
14	559	26	653
15	568	27	659
16	567	28	668
17	578	29	670
18	580	30	672
		31	677



February shows a steady increase and our milk sheet for April 6, 1924 shows 768 pounds daily.

We hope that this will answer your inquiry and we assure you we will be very glad to have you refer to us at any time for information.

Very truly yours,
H.J.LaGrandeur

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII. No. 9 Fort Atkinson, Wisconsin September 12, 1924

Human Hands Can't Compete with This

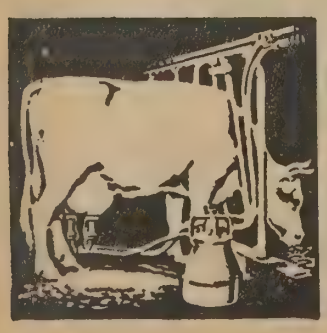
A user of a De Laval Milker recently said: "I would no more attempt to milk cows without a De Laval than I would try to raise wheat without a binder."

You know that hand labor can't compete with machinery---and yet there is no machine a dairyman can own that will save so much time as a De Laval Milker. Figure up what cutting your milking time in two, twice a day every day in the year, amounts to; and then compare this with the time any other machine you own will save.

But this is just one reason for using a De Laval Milker. It milks cows in the way they like best—vigorously, yet with a gentle, soothing and uniform action which stimulates the milk-forming organs to greatest production. That's why De Laval users are practically unanimous in their statements that they get more milk with it than by hand milking.

But that isn't all; with the De Laval cleaner milk can also be produced---and cleaner milk is worth more money.

There are thousands of De Laval Milkers in use which are giving perfect satisfaction. Many users state they would sell their cows and go out of the business if they couldn't have a De Laval.



If you are milking ten or more cows by hand you are losing enough to pay for a De Laval. Send for complete information.

EVER FAILING OR NEVER FAILING PASTURE

Part II.

Getting the Most out of Sweet Clover Pasture

WILBER J. FRASER, University of Illinois

Sweet clover should be allowed to make a high growth the first fall so that the root system will develop enough to enable the plants to stand the winter without heaving and make a rapid, early start the next spring. This is essential to the best results from the next year's pasture.

To secure the maximum amount of feed combined with the greatest palatability the second year, it is essential that stock be turned on when the clover is only four to six inches high and that it be pastured heavily enough to keep the growth of most of the plants down to a height of one or two feet throughout the entire season.

SWEET clover should be seeded in the small grain every spring, so that it will be ready for pasture in the stubble about the last of August when the old seeding dies out, as explained in a previous chapter. The experience of the most successful growers clearly indicate that the following rules are fundamental, if the best success is to be had from the use of sweet clover as a pasture crop.

Should Make Big Growth First Fall

The first year sweet clover should be allowed to get a good start—12 to 15 inches in height—before being pastured. The reason for this is that it must have a good, large root development early in the season. The roots should be as large around as a lead pencil, if possible, before any

Farm Adviser F. E. Longmire and Mr. W. D. Howland of Grundy County, in the latter's oats stubble. The sweet clover was a perfect stand, 8 to 10 inches high all over this field, July 25, 1924, and would be in fine condition to pasture by the middle of August.

stock is turned on, and the only way to get such roots is to let the tops grow.

This enables the plants to store more food and get a much earlier and thriftier start the following spring, which is an absolute essential to high success with sweet clover pasture. The plants should also have a growth of 10 to 12 inches to go into the winter, but this is not nearly so important as large development of the root system. Neglect in allowing the plants this fall development accounts for some of the failures of the crop and many instances of reduced results for the six months' pasture. Here are two good illustrations:

"Some years I find I can turn on by April 15, but pasturing short the first fall puts it back a good ten days the next spring."—Wm. Filman, Northern Illinois.

"I had a strip of sweet clover that was not pastured last fall and it shows a good deal more pep this spring than that which was eaten down close last fall."—W. H. Bartels, Northern Illinois.

Small Roots Heave Out

Several men in answering the questionnaires stated that they had no trouble with sweet clover winter-killing due to having been pastured close the preceding fall. Numerous observations, however, indicate conclusively that in a severe winter, plants which were pastured down closely soon after the small grain was cut, heaved out badly, while those which went into the winter with a good growth of roots did not heave at all. Many fields are pastured down to the ground near the gate but are quite high over the remainder of the field. Invariably a severe winter causes much heaving of the plants near the gate with no damage at all to those with more root and top growth.

A Striking Illustration

On my farm in Northern Illinois, a strip was cut for hay in a field of new seeding sweet clover early in October. The next spring this field was plowed on May 8 and 9, and the clover on the portion cut for hay was four inches high, while that not cut or pastured the previous fall was 8 to 10 inches high and a much thicker growth. The roots were small in the part cut for hay and the soil crumbled into a fine seed bed when worked with a smoothing harrow only, while on the portion of the field not cut for hay the tap roots were large and many small fibrous roots completely filled the soil. This made a tough sod almost like bluegrass, so the land had to be double disced before harrowing to make a good seed bed for corn.

While it is insisted from all observation that the sweet clover shall be allowed to make a large growth above and below ground before stock is turned on the first fall, it is also true that with fair judgment, two months of fall pasture can be secured from the new crop without injury.

Second Year Problem to Keep It Down

There is no danger of the sweet clover getting ahead of the cows the first fall, but the case is exactly reversed the following spring, when the stock should be turned on as soon as the clover is four to six inches high. With three-fourths of an acre per cow of *good, thrifty sweet clover*, there is no advantage in giving the plants more of a start than this. It is rather a distinct disadvantage, because if allowed to grow too large, the stems become woody and the crop loses much of its feeding value. As the clover grows larger, it also becomes less palatable.

To secure the maximum of digestible nutrients combined with the greatest palatability from pasturing the second year's growth, *it is essential that enough stock be put on to keep the growth of most of the plants down to a height of one or two feet throughout the entire season.*

Mr. J. P. Walsh of Southern Illinois says: "Sweet clover pasture should be turned onto the second spring before it gets but a few inches high if there is an abundant acreage. The closer the stock keep it down, the more feed they will get."

Many dairymen fail in this; they underrate the tremendous growth of the clover the second year and haven't stock enough to keep it down. They have too much clover; they use more land than necessary for this heavy producing pasture, and therefore waste the land. Three-fourths of an acre per head of stock is all and sometimes more than can be economically used for pasture the second year.

The above photo taken August 3 shows to the right of the arrow a fine growth of sweet clover three feet high. On the left is a strip which was clipped eight inches high on June 12, with a mowing machine. Clipping killed more than three-fourths of the plants and the clipped strip grew practically nothing but a luxuriant crop of ragweeds the remainder of the season.

Clipping Liable to Injure Pasture

Where sweet clover pasture is growing too rank and getting ahead of the cows, some people have resorted to clipping it about 8 inches high. This is a questionable practice at best and, if done later than the first of June, is nearly certain to be detrimental. Most experienced dairymen prefer to let the pasture grow. The cows will pick off the young, tender branches later, even if the sweet clover is four or five feet high.

Better to Double the Acreage in Fall

Many farmers find that if they use only the same number of acres of

The portion of the field to the left of the arrow was allowed a good growth last fall before it was cut for hay, October 10. This enabled it to develop a good root system. The portion to the right was pastured last fall, which retarded its root development, even though the cows were taken off early enough to permit the sweet clover to grow up 10 inches high before being killed by freezing. The great difference in the size of the clover on July 2, just after the cows were turned on, is readily seen in the picture.

sweet clover pasture in the fall that they use the following spring, when the growth is much more rapid, it is difficult to prevent too close pasturing in the fall. As a result, some men make a practice of sowing twice as much sweet clover every year as they intend to leave over for pasture the second spring. This provides a large acreage in the fall, gives the plants a chance to make a good top growth and develop a large root system with which to go into the winter. There can be no loss or mistake about this practice of doubling the sweet clover acreage for fall pasture. No land is lost to cultivated crops and much needed fertility is supplied to the soil. as one-half of the fall pasture is plowed the following spring for corn. All it has cost is the expense of the clover seed, and this is many times repaid in the increased yield of the crops that follow.

Experience Worth Heeding

Mr. William Filman of Northern Illinois says: "I have pastured sweet clover for four years with excellent success. It takes twice as much area per cow in the fall the first year as it does for spring and summer pasture the second year. Pasturing sweet

(Continued on page 232)

THE PROVING GROUND OF DAIRY FARMERS

S. R. WINTERS, WASHINGTON, D. C.

THE experiment farm of the Dairy Division of the United States Department of Agriculture, located at Beltsville, Md., is engaged in conducting tests to determine ways and means for insuring maximum milk and butterfat production from dairy cows. The quality and quantity of feeds, the types of quarters in which the animals are kept, the changing of milkers, and the utilization of sawdust in the production of milk, were among the factors studied and concerning which conclusions were drawn during the course of the year 1923.

The changing of milkers has no appreciable influence on the yield of milk and butterfat, if we are to accept the conclusion of experiments conducted by the Dairy Division at its experiment farm. An even dozen cows were subjected to this test. During the course of the first and third periods each cow was invariably milked by the same person; in the second milking period no one individual milked the same cow twice in succession. The results of these tests slightly favor the practice of one person milking a herd of cows continuously, since cows thus treated in these government experiments yielded 0.6 per cent more milk and 0.4 per cent more butterfat than those subjected to a change in milkers.

The feeding tests at this dairy experiment farm involved a consumption of more grain than suggested by the Savage feeding standard. Three pounds of grain were fed to cows in excess of this standard, and the animals thus treated responded in terms of a daily increase of 1.6 pounds of milk, 0.09 pound of butterfat, and 0.32 pound of body weight. Similar feeding observations indicated that cows given a small amount of roughage and a liberal supply of grain produced more milk and butterfat and accumulated more flesh than dairy animals fed sparingly with grain and liberally with roughage. Both groups of cows, in this instance, were fed according to the Savage standard. These results are responsible for the Dairy Division drawing the conclusion that the digestible nutrients in concentrates are worth more than an equal weight in roughage.

"Cows were fed a definite small quantity of hay, followed by all the silage they could eat, with grain sufficient to bring the total nutrients to standard, and the quantity of silage taken was noted," states a report of the superintendent of the dairy experiment farm in relating the results of another feeding test. "Later they were fed a larger quantity of hay, followed by their fill of silage as before, and it was found that for every additional pound of hay they ate almost exactly one pound less of silage, the total of roughage remaining the same. Since hay contains more nutrients than silage, using the larger ration of hay reduces the amount of grain needed. The quantity of total roughage consumed seems to be dependent on individual size and nature rather than on the quantity of milk produced."

Within recent years, the Forest Products Laboratory of the United States Department of Agriculture, in co-operation with the College of Agriculture of the University of Wisconsin, has conducted extensive experiments at Madison with the view of utilizing hydrolyzed sawdust as feed for dairy animals. More recent feeding tests by the Dairy Division at the experiment farm, Beltsville, Maryland, tend to discourage the use of this by-product from the manufacture of industrial alcohol as feed for cows. The sawdust contains much material of no feeding value. True, when chemically treated, sawdust may be used in limited quantities for sustaining dairy cows, but the present prices of other feeds and the relative cost of treating sawdust render it inadvisable to recover the nutritive contents of this by-product.

The tests of butterfat in the milk of all the cows at the dairy experiment farm, made in January and July, were analyzed. All told, 166 cows were tested during these two months. Results of a comparison of the tests in January and July indicate that there is a lowering of the butterfat test in summer as compared with winter, the variation being from 0.02 to 0.75 per cent. The continued feeding of prickly pears and the study of such results confirm preliminary conclusions that the magnesium in this desert plant has little or no influence in lowering the butterfat content of milk.

Stanchions, in a measure, merit the continued favor of this dairy experiment farm, although a comparative test with this form of quarters and box stalls for keeping cows gave the latter a marginal advantage in certain particulars. The cow maintained in the box stalls yielded a little more milk, evidenced a slightly increased butterfat production, and the animal accumulated more body weight than when confined to stanchions. However, in the final analysis, this dairy experiment farm recommends the use of stanchions since the increased yield of milk and butterfat due to the use of box stalls does not measure up to the additional expense of bedding and labor necessary to the maintenance of box stalls. Therefore, in speaking of the latter, the Dairy Division concludes, "this method is not to be advised except where maximum production is desired regardless of expense."

BUILDINGS AT BELTSVILLE DAIRY EXPERIMENT FARM

The experiments in progress, but not far enough along to warrant conclusions, include: The influence of feeding a large quantity of hay and small amount of silage compared with reversed quantities of these feeds; acquire information whereby the Wolff Lehmann standards for growing dairy animals may be revised; determine the quantity of extra feed first-calf heifers need in order to make normal growth while giving milk; and determine whether the frequency of feeding hay affects the quantity consumed and the milk production.

The War and Navy Departments of the United States Government maintain so-called proving grounds in the vicinity of the National Capital where instruments of warfare are tested and their merits proven or disproved. The dairy experiment farm of the Dairy Division, at Beltsville, Maryland, is the "proving ground" of the dairy farmer. Here, feeding and breeding theories are subjected to critical tests and if they qualify as practical under dairy farming conditions, they are passed on to dairymen for application. If, however, the suggestions and theories are exploded as worthless they are discarded as of no value to the dairy industry.

FAVORS T. B. TESTING

C. M. CHRISTY, PENNSYLVANIA

IN THE issue of your journal of August 8, 1924, was an article entitled, Dozen Reasons Against T. B. Testing, written by an Illinois Dairyman. As I am very well familiar with the subject I shall try to give twelve reasons in favor of T. B. testing, answering the gentleman's reasons one by one.

1. The question of transmission of bovine tuberculosis to people has been definitely shown by American and European investigators. Medical authorities estimate that 25 per cent of tuberculosis in man can be charged to the tuberculous cow; 40 to 50 per cent of abdominal tuberculosis and tuberculosis of the cervical glands in children show in microscopical examinations the presence of the bovine type.

2. The accuracy of the tuberculin test is 95 per cent, sometimes higher. The no lesion cases are due sometimes to an early infection in which no time is given for the development of the typical tubercles. In such cases the germs of tuberculosis are found in the blood stream manufacturing their toxins or poisons which give the characteristic tuberculin reaction. Sometimes they are due to an infection with the human type of tuberculosis which lacks the power of forming tubercles in cattle.

3. No matter how small the tubercle is in the reacting cow, if the animal is allowed to go on, there is always a danger of generalized tuberculosis and thus have tubercle germs eliminated with the milk. If the veterinarians conducting the post-mortem examinations were able to examine every tissue and organ under the microscope, the no-lesion cases would be very, very few, probably not more than 2 per cent. But such an examination requires a special laboratory, an additional personnel, and is not practical.

4. There is a very definite policy adopted by the federal and state governments concerning the eradication of tuberculosis. No misleading statements are tolerated by either government. The man who, as the dairyman from Illinois states, contradicts the statements made on the findings of tubercular lesions in slaughtered reactors, I do not believe is very familiar with autopsies. I am sure that if he studies tuberculosis and tubercular lesions in particular and visits some of the abattoirs where the reactors are killed, he will change his attitude toward the subject.

5. After a herd is cleaned up and all the necessary precautions are taken to eliminate any introduction of the disease, it remains clean. Practically every new outbreak in an accredited herd can be traced to some source of infection.

6. If a person wants to keep his herd clean, he must do all in his power to lessen any chance of reinfection.

7. A tuberculous cow is a detriment to the farmer and community. She has no place on the farm. She is a menace to the health of the farmer's family and people consuming her products; she must be eliminated.

8. Pasteurization does not always kill the tubercle bacilli. In naturally infected milk the tubercle bacilli are embedded in masses of mucus, clots of fibrin, or shreds of tissue and this albuminous covering protects them from the action of heat.

9. A dairyman or a farmer ought to be willing to suffer some loss from the actual value of his animals. He should realize that they are diseased.

10. Even though, as the dairyman from Illinois admits, the per cent of human infection traceable to the bovine type of tuberculosis is low, there is no reason to keep an animal with tuberculosis on the farm. Saving lives of even a few children is sufficient reason to exterminate the tuberculous cows from the farm.

11. The government officials have more than they can do without costing for the test. There are thousands and thousands of progressive farmers waiting for the tuberculin test of their cattle.

12. If the animal on post-mortem examination shows evidence of generalized tuberculosis the entire carcass is tanked. But when there is only a localized form of the disease some of the meat is used, being absolutely safe for human consumption.

Beggarweed

The Florida Department of Agriculture has just issued a bulletin on Beggarweed prepared by Mr. C. Leach, who has given the readers of Hoard's Dairyman considerable information concerning this plant. The bulletin is very well illustrated, discusses the different varieties of beggarweed and also the development of this plant on Cherokee Farms operated by Mr. Leach. He discusses its feeding and fertilizer value and how the crop should be handled and fed. Those interested in this subject can secure a copy of this bulletin by writing the Commissioner of Agriculture, Tallahassee, Fla.

Good Results from Hard Work

CLARENCE BROWN, OHIO

THE HOME OF MR. HARTER AND PART OF HIS PRESENT HERD

RODE recently with Professor Oscar Erf of the dairy department of Ohio State University visit a farmer whom cows have set ree. As we scurried along the Naonal Pike from Columbus to Thornille, Licking County, Ohio, where is farmer, M. C. Harter, lives, rofessor Erf said:

"He has always been a hard workr, heavily in debt, and not much iance of getting out until he began sting his cows and discovered that is herd was worth some money. He ound out that out of five cows he as testing that all were Register of erit cows, three were gold medal ws, and one a state champion. He ld this bunch after the test for ough to lift his mortgage and put m on his feet.

"He made good because he stayed the job. So many farmers will not that. I helped Mr. Harter decide s ration and I felt that once he arted to test he would see it rough. He is successful today beuse he did see it through."

The professor continued, "I have en trying to drive home this testg work to the farmers of this state r some time. They cannot make ney in dairying, I tell them, witht good cows. And they must test discover good animals. There is other way. But so many fail to light. Mr. Harter, though, did see d was not so easily discouraged d he won out. His records were de under ordinary conditions, ."

In about an hour we turned south m the National Highway and into hills of Southern Licking Coun. Then the "very ordinary condins" became noticeable. The hills re large and the farms but fair king. Turning from the main road a "mud pike" we ran along a lge top and soon we saw the Har- home nestled among the hills be-v. A group of Jerseys in pasture the house took my eye. Most of m were young animals, it seemed, we lowered our Ford down the hill l into the driveway. As we drove ard the house I noticed only one d cow in the lot. The remainder re heifers and a few young bulls. e has type as well as production, parently," I thought as the anils raised their heads to watch us s by.

n the barnyard we asked a young n busily repairing a double-tree ere we could find Mr. Harter. "He gone to Newark but will soon be e," he answered. Meanwhile we ed about. The barn nearby was a n structure. The house, too, was retentious though well kept and active. The other buildings were and common. I remembered Proor Erf's phrase—"ordinary conons". In the barn, however, I d electric lights and I saw wires g to the house. "Modernly pped, at least," I thought, "and aps not as ordinary as before he those cows."

on a motor car whirred into the l. It was new, or fairly so, and it not the cheapest car sold. A ium sized, genial man just passed ile aged got out of the car and jovially greeted the professor. The professor then turned my way and introduced me to Mr. Harter. He greeted me wholeheartedly.

"Come out to the barn and see my new bull calf," he said. "I just got him the other day from Spann in New Jersey and I think he will suit me." Spann of New Jersey is one of the largest Jersey plants in the East. We viewed the calf and found him a typy youngster. "He is a double grandson of Golden Fern's Noble; that's the line I want to breed into," said Mr. Harter, "and I think I have a bull that will raise the herd a notch higher. I always aim to get a better bull than my last one was and I find that hard to do now. But I think I have found one in this calf."

As we left the barn and walked through the pasture looking at and taking pictures of the herd I gradually gleaned Mr. Harter's story. I give it to you briefly.

He was, until thirteen years ago, a renter and a hired man. Many days he worked for seventy-five cents to a dollar a day. After getting enough money for a small down payment he moved to his present farm. He started early to fight his heavy mortgage by keeping good Jerseys. He tested and built up his herd. About nine years ago he went to Hal Hill's dispersal sale to see about a future herd sire. He had his eye on a bull calf to be sold there. The calf's breeding was good with Golden Fern's Noble blood on the sire's side and from a tested dam. But Mr. Harter did not like its individuality. He was, therefore, leaving the farm without the calf when Mr. Hill offered it to him for $35. Mr. Harter made the purchase. This calf, Lilac's Fair Play, was later the bull that started Mr. Harter's success.

MR. HARTER WITH FAIR PLAY'S PRINCESS, THE CHAMPION, ON THE LEFT AND LILAC'S EMPRESS ON THE RIGHT

Fair Play later sired several good heifers from matings with the daughters of Harter's former bull, Coronation's Chief, a son of Fountaine's Chief. This combination brought the winners.

About five years ago Mr. Harter began Register of Merit testing. From the results he either culled his cows or kept them and believing he was on the right road kept on testing. The results are that on his last test of five cows all made Register of Merit records, three proved to be gold medal winners and one, Fair Play's Princess, became Ohio's senior four-year-old champion Jersey for fat production. Princess' record for the year was 964.48 lbs. fat, and she dethroned Tonona's Jean of Hartman Stock Farm, former champion, whose record is 937.16 lbs. of fat. Records of the five cows follow:

	Fat Lbs.	Age Yrs.	Mos.
Fair Play's Princess	964.48	4	11
Lilac's Empress	877.21	4	9
Coronation's Extra Beauty	814.88	3	2
Lilac of Licking	529.43	3	8
Lilac's Cora	516.15	4	8

These records at once brought Mr. Harter notice and orders for breeding stock. He could have sold his entire herd for fancy prices. Twin Oaks Farm, an eastern Jersey stronghold, came through with an offer that was accepted, and the champion and three of her test mates were sold for $4,500. Fair Play's Princess, the champion, brought $2,500 and Lilac's Empress and Lilac of Licking were sold for $1,000 each. Lilac's Cora proved a doubtful breeder after the test and she went with the other cows as a near gift. Cora is now being treated at Twin Oaks to restore her breeding powers.

"I surely wish I had more young heifers to sell," said Mr. Harter as we sat in the living room. "There are orders coming here all of the time and I must turn them down. But I am going to take it easy this summer," he continued, "and my wife and I are going to drive East and see some of the big Jersey farms."

LILAC'S FAIR PLAY, THE SIRE THAT EARNED HIS OWNER A FORTUNE

Coronation's Extra Beauty was the only cow in the test that was not sold to Twin Oaks Farm. She was also the only one of the five that was not sired by Lilac's Fair Play. She is, however, the dam of Lilac of Licking and Lilac's Cora by matings with Fair Play. The old cow was sired by Coronation's Chief, Fair Play's predecessor at Harter's.

Mr. Harter is wise in keeping this cow in the herd. She is good seed stock for more winners. She is a beautifully typed cow as well as a Register of Merit producer. I saw her on pasture amid a bunch of beautiful heifers, most of them granddaughters or great granddaughters of old Fair Play. Out of the fourteen Jerseys now on the farm there are five granddaughters and three great granddaughters of the old bull.

THE HARTER BARN WHERE THE RECORDS WERE MADE

This is briefly Mr. Harter's story as it was told to me and as I found it there among the hills. The records of Mr. Harter's cows are undoubtedly one of the greatest sermons on testing to be found within the Buckeye State. And they were made, as I want to emphasize, under ordinary conditions. Mr. Harter's farm is nothing but an ordinary farm of 80 acres. Of this, about 25 acres are too hilly to cultivate or are in woods.

During the summer the cows ran on pasture, during the winter they were housed and well cared for. Mr. Harter fed them scientifically, milked them regularly, and watched their health carefully. He worked hard and persistently. "In a year," he told me, "I missed doing the milking myself only twice, and I milked my three highest cows four times a day."

He worked hard, I thought after we had said good-bye and were nosing up the long hill to the top of the ridge, but his cows came through with the records, made him a fortune, and brought him recognition.

Sex of Calves

HOARD'S DAIRYMAN:—The live stock breeder usually assumes that if the cow carries her calf over a more extended period than 283 days of pregnancy that the calf will be of the male sex. To determine whether this is true or not we have studied the breeding records kept in connection with the dairy herd at the Kentucky Agricultural Experiment Station, the records covering a period of approximately 20 years. We have not included any gestation period that did not exceed the usual period by at least 5 days. Three hundred gestation periods were examined and 44 selected that considerably exceeded the usual period.

It is found that the 44 cows exceeded the usual gestation period by from five to seventeen days. They gave birth to 44 calves, 26 of which were bulls (59 per cent) and 18 of which were heifers (41 per cent).

Of two cows carrying calf 14 days over time, one had a heifer and the other a bull. The only case where there was a decided predominance of one sex was in the case of cows carrying calf 6 days over time. In this case, 12 calves were male and only 3 were females.

THE WISCONSIN STATE FAIR

IF you will look back over Wisconsin State Fair reports for the past several years, you'll find the weather man gets blamed regularly for lack of attendance during part of the week. He gets the blame for smaller crowds than usual this year, but in a different way. The weather during fair week was too good. After the wet weather Wisconsin farmers have had all summer, this week of sunshine was too valuable to pass by unused, and harvesting, threshing, and haying kept a good many of them home that would normally have spent at least one day at the fair.

Exhibits generally were well up to standard and a new Manufacturers' building helped to house some of them to advantage. It is to be hoped that more of them will be in it next year.

A High Producing Herd

The Cow Testing Association showing was a striking illustration of what can be accomplished by intelligent breeding and feeding. It consisted of the entire milking herd (13 head) of Leo Kuhl and Son of Grant County, Wisconsin. Mr. Kuhl, you should know, is a farmer that depends upon his farm and his herd for his livelihood. He early found that for a profitable herd it was necessary to use good sires, save his best heifers, and to feed intelligntly. Two years in a cow testing association show he has been successful.

Last year those 13 registered Holstein cows and heifers produced a total of 196,544 lbs. milk and 6,948.5 lbs. butterfat which brought a net profit of $2,548 over feed cost. There was an average production of 534.5 lbs. fat per cow and an average profit above feed cost of $196. The high cow produced 839 lbs. butterfat and the lowest producer had 325 lbs. fat to her credit. It is interesting to know that the high cow, Pauline Ormsby DeKol Canary, the best Cow Testing Association producer in the state for 1924 received 5,550 lbs. grain, 50 lbs. salt, 1,800 lbs. hay, 6,000 lbs. silage, and approximately 90,000 lbs. of water during the year.

Mr. Kuhl was very successful in improving his herd. The line-up in the exhibit barn showed dams, daughters, and in one case a granddaughter. With one or two exceptions the daughters were an improvement over their dams as producers and as individuals.

The Biggest Show of Dairy Cattle

The dairy cattle show this year was away ahead of previous shows and was probably one of the largest, if not the largest, dairy cattle showing ever seen at any state fair. Eleven hundred and two animals passed before the judges; enough to crowd the barns to overflowing.

Holsteins were as usual the leading breed with an exhibit of 526 head, the largest number of black and whites we have ever seen at Milwaukee. Among them, there were of course, some tail enders, but they were surprisingly few for such a show. All of them were Wisconsin cattle and almost all represented county associations. The county show herd class brought out 13 entries, 130 head that just about filled the judging ring. Jeffrson County repeated last year's performance and stood first, Milwaukee County was second, and LaCrosse County third.

Last year there were 161 Jerseys shown at Milwaukee; this year there were 214, making one of the best Jersey contests Wisconsin has had for years. A good herd representing The Oaklands from Michigan, and Mr. J. K. Dering's Cedar Crest herd from Illinois were the out-of-state exhibitors and while each of them was fairly successful, they found competition surprisingly keen with honors pretty divided all around when the last class was placed.

Guernseys were not quite up to standard in point of numbers, the 211 head entered being 50 behind 1923. It was a good show, however, with every class a close one and blue ribbons pretty well scattered among the different herds. D. D. Tenny, Minnesota, was the only out-of-state exhibitor. F. J. Rueping was the biggest winner with eleven blues and two championships to his credit.

The Brown Swiss show was only about half as large this year as in 1923. Classes were small in most cases and this always makes a less interesting show. N. C. Schmid was very much the heaviest winner. His herd took 15 blues out of 18 blues and all of the championships.

Ninety-eight Ayrshires made a showing just about equal to former years. Adam Seitz and Sons, with 38 entries, were the big exhibitors and incidentally the heaviest winners, with the herd of H. M. Wallis a good second. Wm. Nisbet and Sons, Daneil Hanrahn, and J. B. Walvoord and Sons were the other exhibitors.

MADAM ARTIS WAYNE DENVER, FIRST PRIZE THREE-YEAR-OLD, SENIOR AND GRAND CHAMPION AT WISCONSIN STATE FAIR
OWNED BY JEFFERSON CO. ASYLUM, WISCONSIN

Upper illustration shows the 13 County Show Herds of Holsteins, consisting of 130 head as they appeared in the arena at the Wisconsin State Fair. The lower shows Wisconsin's Highest Producing Herd, consisting of 13 pure-bred Holsteins owned by Leo Kuhl & Son, that averaged 534.5 lbs. fat. This exhibit was made by the Wisconsin Dairymen's Association to show the value of cow testing work.

A complete list of first prize winners for all breeds follows:

Holstein

Judge: Ward W. Stevens, New York.

Bull 4 years or over—Baltz Hoesley, Wisconsin on North Star Joe Homestead. Bull 3 years old and under 4—Joe E. Piek, Wisconsin, on Johanna Ragapple Pabst. Bull 2 years and under 3—Fred Wiffenbach, Wisconsin, on King Pontiac Champion. Senior yearling bull—H. W. Halbach and Sons and L. J. Halbach, Wisconsin, on Sir Fobes Ormsby Hengervelde Junior yearling bull—Jefferson County Asylum, Wisconsin, on King Mutual Fan. Senior bull calf—J. D. McDonald Wisconsin, on Pietertje Pontiac Fayne. Junior bull calf—Clarence Halle Wisconsin, on Gen. Homestead Mercedes.

Senior and grand champion bull—Joe E. Piek on Johanna Ragapple Pabst Junior champion bull—Jefferson County Asylum, on King Mutual Fan.

Cow 5 years old or over—Agricultural School Farm Wisconsin, on Barbette Hengerveld De Kol. Cow 4 years old and under 5—St Croix Co. Asylum, Wisconsin, on Beryl Johanna Maid Cow 3 years and under 4—Jefferson County Asylum on Madam Artis Wayne Denver. Heifer 2 years and under 3—J. D. McDonald on Bessie Pontiac Rose 2nd Senior yearling heifer—Jefferson County Asylum on Johanna Wayne Rue 2nd. Junior yearling heifer—C. G. Keyes, Wisconsin, on Cosy Burke Ormsby. Senior heifer calf Baird Bros., Wisconsin, on Nockdair Model Canary Parthenia. Junior heifer calf—E Riederer, Wisconsin, on Cato Pine Violet Ca

IOWA'S jubilee fair is over. It was her greatest fair. Seventy years ago a young newsaper man rode several miles on horseback to cover the first Iowa fair held in Greenfield. A little eleven-year-old girl was likewise a fair visitor that year. She came in a covered wagon. J. S. Shepherd, ninety years of age, and Mrs. Eliza Rhodes, eighty-four years young, were the honor guests at the 1924 Iowa State Fair held in Des Moines, the capitol city, Aug. 22 to 29. In the state wide search for the oldest man and woman fair attendants these two "youngsters" won. Today, the mode of travel is quite different. Railroad trains and automobiles supplant the horseback and covered wagon of old.

Although this year's fair has expanded to proportions undreamed of when the first state fair was held in 1854, the same spirit of devotion to the Hawkeye state has filled the visitors at every one of the seventy reunions and this spirit has been responsible in a large measure for the steady growth of the state fair until it is today recognized as one of the nation's leading state fairs. This loyalty in the hearts of the sons and daughters of Iowa has likewise helped in placing this state in the front ranks agriculturally speaking. Were you to compare the attendance of the 1924 event with 1854 you would find a marvelous and astounding growth. Where hundreds attended, thousands now throng.

It was generally conceded that one of the big features of this year's fair was the boys' and girls' club department. More than 1,200 of Iowa's future farmers took part to make it the best of its kind in Iowa. A large number of demonstration teams competed in all the various subjects of agricultural and home making treated in project work. The pig, sheep, poultry, and baby beef club exhibits all had large entry lists, and the judges had their hands full in determining the winners. The club camp, "on the hill", was a veritable bee hive of activity the whole week. In the huge dining hall several hundred hungry mouths were fed each day. On Wednesday afternoon, the program featured the 4-H club members and a gigantic parade of some thousand boys and girls in front of the grandstand started the festivities.

That the horse still maintains a high place in agriculture was conclusively demonstrated in the horse department of the Iowa State Fair. There are few, if any, state fairs in America that can boast of such a large and splendid horse show, hog department, or beef exhibits. Strange things sometimes happen, but it really is not strange that side by side at the Iowa fair should be found a mammouth exhibit of farm machinery and a big barn full of some of the finest horseflesh in America.

If you are interested in fine grains and forage crops, in bees, and honey, in flowers fair to behold in any of the several phases of horticulture but more especially the story of the apple, then the agricultural exhibit building was a place where you could profitably spend considerable time. Here, too, were housed the dairy produce exhibits featuring butter statuary and a most excellent exhibit furnished by the United State Department of Agriculture. In a series of booths this exhibit pictured in colors and in ink several lessons in better dairy methods, including co-operative bull associations, lime and legumes, co-operative marketing, cow testing associations, and boys' and girls' calf club work. In this building also the Iowa State Dairy association had a booth in which they featured calf club work in Iowa, stating in picture and placard the advantages of building for the future, and giving out the fact that over 600 dairy calves are enrolled in calf club work in Iowa this year.

Without a doubt, the Iowa State Fair is distinctly a farmers' fair. An eighty acre tourists' camp attests strongly to this fact. Here the farmers and their families can reside during the entire week, tenting out, and get their own meals if they so desire.

OWNED BY MEREDITH FARMS, IOWA

Dairy Cattle Exhibit

The dairy cattle show at the 1924 Iowa state fair eclipsed all former records in both quantity and quality. In every class competition was exceptionally keen. A total of sixty-five exhibitors showed some 668 head. Last year's entry total was 450 head. The Holstein breed led with 262 entries, an increase of 22 head over last year. Jerseys had 163 entries as against 90 last year. The Guernsey showing more than doubled in point of entries, there being 144 entries compared to 70 a year ago. Ayrshires were fewer in number but more than made up this deficiency in quality. Thirty-five head were shown. Brown Swiss entries more than trebled 1923 with 64 head.

It can be said that the Guernsey show was one of the outstanding features of the entire dairy cattle exhibit. This division attracted a large number of outside-of-Iowa breeders. Wisconsin, Minnesota, North Dakota, Oklahoma, and Vermont contributed several entries each. Some idea of the keen competition can be gained from the senior yearling bull class. The first three calves were so close that a flip of the coin might have decided the placings. Ringside observers agreed it was a hard matter to decide. The junior and grand champion Guernsey female, Honey Bloom of the Prairie, shown by W. W. Marsh, was a noteworthy animal and splendid individual. She should gain high favor in the best Guernsey society of the land. As a senior calf and junior yearling she

EDITORIAL COMMENT

ACCORDING to the Department of Agriculture, 19,000 farmers intend to sow more winter wheat this fall than last year. The figures show that the acreage will be increased by about 7½ per cent. The advance in the price of wheat is responsible for these farmers increasing their wheat acreage. In 1923 the dairy farmers produced seven billion pounds more milk than in 1922. The prices of dairy products being relatively higher than many other farm products, was the main reason for increasing production of milk.

It has been ever so, that when prices advance to a point where it seems profitable to produce a certain article, there will be immediate increase in its production. Those who try to regulate production by talking, by rules, or by laws have just about as much effect upon the producers of this country as an old woman with a broom by the seashore trying to sweep back the waves of the ocean.

FAMILY DIET

The National Dairy Exposition has established a new department which will devote itself to instructing visitors how to feed the family. This new department is being developed by H. E. Van Norman, president of the National Dairy Show Association.

Nothing is more important to the welfare of the people of this nation than knowledge on how to feed the family. We cannot hope to develop strong men and women unless they have proper diets. The World's War taught us that as a nation our people are not being fed properly. Altogether too many young men were rejected because of improper development. We may well be proud of our accomplishments but to dwell upon them and to feel self-satisfied, when not all housewives know how to balance a ration for the family, is unwise and short-sighted.

A demonstration and exhibit as to how to prepare a proper diet for the family is a commendable piece of work and one that should interest every visitor at the National Dairy Show.

PRODUCERS TO FORM FEDERATION

At a call issued by G. R. Rice, Secretary of the Milwaukee Milk Producers' Association, several representatives of Wisconsin milk producers' associations met at Milwaukee recently and laid plans to form a milk producers' federation. Representatives came from the following cities: Racine, Madison, La Crosse, Superior, and Sheboygan.

The next meeting will be held at La Crosse the first Tuesday in December, and it is expected that representatives of the milk producers' associations of Kenosha and Eau Claire will also be present.

This is moving forward with the Wisconsin program for organizing the dairy industry for processing and marketing dairy products. It is not contemplated to pool the milk produced in these various communities through a federation. Each organization will carry on its own work, but by a federation someone can be employed to gather information concerning the dairy industry and to co-ordinate the various units that they will work for the mutual benefit of one another. We look upon this as a wise and sensible procedure.

PROVEN SIRES

The Bureau of Dairying is carrying on an extensive experiment in breeding dairy cattle, attempting to gather more practical information which will be of help to the breeders of dairy cattle in this country. One of its projects is to loan bulls to dairy farmers in the community where their experiments are being conducted. This work of loaning bulls is but a part of its general breeding project in which it plans to use sires, for generation after generation, that have proven their ability to transmit uniformly high production and good type.

In a recent article our correspondent, Mr. S. R. Winters, stated that the Bureau of Dairying had but two bulls loaned from its experiment station at Huntley, Montana. This was a misstatement of fact, for all bull calves from its five herds are loaned to farmers in the the vicinity. Its object in loaning the bulls, as described by Mr. R. R. Graves, in charge of dairy cattle breeding investigations, is to determine their transmitting ability of milk and fat production and type. He states further, "The sires that prove prepotent for these characteristics will be used in our experimental herds and if we have more prepotent sires develop than we can use in our own experiments, we plan to loan these proven sires to state experiment stations and colleges. At the present time there are some 25 bulls loaned from the herd at the Huntley Experiment Station, and from our five herds we have loaned some 75 bulls that are in the process of being proved."

The time is coming when no bull will be used upon a well developed herd that hasn't first been proved that he is capable of getting high producing and good type animals.

MICHIGAN MILK PRODUCERS

A summer meeting of the Michigan Milk Producers' Association was held at the Michigan College of Agriculture on the 21st of August. The members during the forenoon visited the Experiment Station and in the afternoon listened to discussions on co-operation and the future of the dairy industry.

It is not our purpose to attempt to report this meeting, but we desire to quote a paragraph or two from John D. Miller's address, which relate the purpose and object of co-operation. We do it for the purpose of setting clearly before the minds of some people who think co-operation is an attempt to fix prices and that it is a socialistic movement. Regarding this, Judge Miller, in part, said:

"These co-operative associations are but efforts to mobilize the financial and commercial strength of the farmers; not to tear down but to build up.

"These associations are not socialistic. They are an aggressive negation of socialism. They are founded upon recognition of the right of private property, and are opposed to government ownership, operation, or control of the industrial and commercial systems of the country.

"They do not attempt to repeal or suspend economic laws, including that of supply and demand, but rather to so mold conditions that every city may be supplied with all the milk it desires and no more, and the surplus converted into less perishable products and sold in the markets of the world.

"They do not ask government assistance. All they ask of government is to clear away any obstacles by the enactment of such laws as will permit them to exercise their own powers of initiative. They are opposed to unnecessary governmental interference in any business, believing that the wonderful development of the industries and commerce of the country is because men have been at liberty to exercise their power of initiative in the development of the various industries of the country."

We would like to add also that we know of no association that has rendered a better service to its members than the Michigan Milk Producers' Association. Its officials have had an understanding of correct principles and practices of business and by their attitude and their requirements have built up a relationship between their organization and the milk dealers that is working to the advantage of all concerned. It is the idea of some men that the only way a farm organization can be successful is through fighting those who are purchasing the farmers' product. They grow suspicious of their officers if there is harmony between them and the men to whom they sell. This shows a false understanding of what a farmers' organization is created for. Its purpose is to secure the best market prices for farm products and to place them on the market with the least possible expense.

The officers of the Michigan Milk Producers' Association have been successful in that they are working in harmony with those who purchase their milk and they have been able to get as much for milk as any organization similarly situated. The milk producers belonging to this organization should be thankful for the position which their organization holds and what it has accomplished for them.

SERVICE AND SUCCESS

True success comes through rendering useful service. This applies to individuals, to farm organizations, and to institutions of all kinds. The National Grange, one of the leading farm organizations of this country, has recognized and followed this principle. In any community where a considerable percentage of farmers belong to a Grange, one is impressed immediately with the saneness of views and with the understanding of public questions. Members of the Grange, as a whole, view agriculture in its true light and see its relation to other industries in the proper way. They are interested in the development of farm life, the community, state, and nation as well as in the making of money. Money with them is only a means to an end. In a weekly letter issued by the Grange, its Washington representative, Mr. T. C. Atkeson, states the following:

"I take it as fundamental that the reason the Grange keeps on working, growing, spreading, and increasing in prestige and in good repute, is because it deals so largely with the leisure, the outside-of-routine, the social, the recreational, and the educational sides of agricultural life. In the doing of these things, the members of the Grange are really learning to know each other as they are—outside of the dollar environment—and because of this knowledge of each other come the realities of business confidence, when the time arises for business organization for mutual benefit.

"I have a map on which is designated by black dots and other indications, the localities where successful co-operative enterprises are flourishing. I have another map on which by dots and other indications are the localities where Granges are flourishing. With a few exceptions, one the great fruit co-operative section of California, the dotted and shaded areas of the two maps almost coincide. But the Granges are thirty and forty and fifty years old. The co-operatives are eight or ten or fifteen years old."

How well the work of the Grange exemplifies the Master's statement: "He that findeth his life shall lose it and he that loseth his life for My sake, shall find it". To be able to serve ourselves best we must be willing and ready to serve others.

Seeding Sweet Clover

Your articles on sweet clover for pasture are very interesting. Will it do well without being fertilized? Is it too late to sow some for pasture next season? How would you advise me to try it?

Wolfeboro, N. H. R. C. B.

Sweet clover, like all other plants, will do better on well fertilized soil than upon poor ground. However, it seems to be less dependent upon a fertile soil than is alfalfa. If the soil is sweet and the proper inoculation is used, reasonable success can be expected from sweet clover, even on the poorer class of soils.

The best success has been usually had with seeding sweet clover with grain in the spring, using from eight to twelve pounds of seed per acre. We recommend the use of the biennial white sweet clover where it is desired to pasture this crop. In writing for seed, mention that you desire the scarified biennial white sweet clover. Sweet clover seed has a tough, resinous coat and unless the seed

has been scarified so as to properly break this coat, the seed does not germinate readily.

It has been customary in some places to seed sweet clover in the last cultivation of corn and good success has been reported with this practice. It may also be possible to seed it after corn has been taken from the ground for silage, or immediately following the harvest of a grain crop. However, if seeded after August 1st, there is some possibility that the growing season will not be long enough for the sweet clover to establish itself vigorously and it may not go through the winter well. As the cost of seed is not heavy, this may be a good speculation where it is desired to have spring pasture on the sweet clover. There is very little loss if the sweet clover does not make a sufficient growth, for the ground can be plowed in the spring for corn, if not for the usual grain crop, where the stand is too poor for pasture.

Seeding Sweet Clover on Sod

I have become quite interested in trying to grow some sweet clover for pasture. I have only a 40-acre farm but there are enough acres that can not be plowed, on account of limestone, to pasture my herd—providing it would grow sweet clover. There are a few hickory and white oak trees on the pasture land, too, that I do not care to cut off. How can I get sweet clover started in this case and how long will it stay? This pasture is all high and well drained.

Wisconsin. C. F. D.

We would suggest that you go over your pasture as early as possible next spring, giving it a thorough disking, preferably disking both ways. You may then seed 8 to 12 lbs. of scarified biennial white sweet clover. This may be broadcasted and the early spring rains will cover it sufficiently, although it may be gone over with a drag if this seems desirable when the soil is inclined to be sandy or light. The seed should be inoculated.

If not practical to work the land with a disk harrow or other tillage instrument, you may have some success by seeding the sweet clover directly on the present sod. In this case it might be preferable to use the unscarified seed, increasing the amount sown to 15 or 20 lbs. per acre. The seed, particularly if scarified seed is used, is best sown as early in the spring as possible and just as the frost is going out of the ground. It is possible that the use of the unscarified seed this fall might be productive of results.

Sweet clover will live for only two years, but it makes such vigorous growth that it will tend to reseed itself in part the second year. However, the cost of seed is not heavy and it is desirable to have the insurance of reseeding at least every two years, if not every year.

Reports are desired from others as to their experiences in seeding sweet clover on sod.

Milk Route on Shares

A neighbor wishes me to take charge of his dairy herd and milk route on shares. The herd consists of about 30 cows, 22 cows in milk all the time. He is to furnish cows, feed, pasture, and all equipment and deliver all feed to the dairy barn. I am to furnish all the labor to milk, feed, deliver milk, and collect, also all creamery help. What share should I receive?

Aldie, Va. O. T. S.

We have no information of dairy herds being handled on shares in the manner indicated. We have had occasional inquiries of this character, but have had no reports of this method being put into actual operation.

Mr. W. J. Dougan, a Wisconsin dairy farmer who has had large experience in operating a dairy farm and retailing a high quality of milk, has given us some information which may be helpful in coming to such an arrangement as desired.

For many years Mr. Dougan has kept very exhaustive records and he finds that his man labor expense runs from 25% to 33% of his gross receipts. He is of the opinion that where the owner furnishes everything but the man power, the tenant or operator would be properly compensated by allowing him 25% of the gross income. If extreme care is to be given the cows and the handling of the milk, he believes that the percentage allowed should be increased to take care of the extra labor cost.

Mr. Dougan writes us that he can see very little value in the share arrangement over a direct salary. He says the tenant's only means of increasing his income is to increase production and cut down labor costs. To do this he would be inclined to feed rather extravagantly and to lessen the work to a point where it would degrade the quality of the milk. On the other hand, the owner would desire to lessen the feed costs and to increase the labor in connection with the care of the herd and the milk.

Buckhorn

Please send me any information on how to get rid of buckhorn in the land.

Casco, Wis. J. D.

Buckhorn is a perennial plant perpetuating itself each year by means of fibrous roots. It does not spread by its roots as does quack grass and Canada thistle, hence the plant can be killed by removing this tuft of fibrous roots from the soil. It is not a difficult matter to kill the plants by thorough plowing and cultivation. The fact that on any farm it first appears in a clover field where the farmer dislikes to plow up the field for fear of destroying his hay crop, the buckhorn is often allowed to go to seed. The fact that clover is usually cut twice in a year would seem to indicate that the buckhorn would not be apt to go to seed. The writer has known a time when all visible stems of the buckhorn plant were removed eight times during the season but still new shoots appeared as late as October 1. This gives some idea of the persistence of the plant in seed producing. Being a perennial the plant does not produce seed the first year and the seed stems appear in the second year in the clover. If a field is badly infested it will be a good plan to plow the clover field at once in order to destroy the buckhorn plants before they have opportunity to produce seed. This may cause serious loss to the farmer if he happens to need the hay badly but it will save him money in the end. If the buckhorn is allowed to go to seed and the seeds are plowed under when the clover sod is turned over, the seeds will lie unharmed in the soil for years, probably twenty or more, and every time the field is plowed some of the seeds are brought to the surface and unless the field is watched very closely another crop of seed will be produced and the last state of the field will be worse than the first. In other words, the plants themselves are easily destroyed. The thing that is essential is to prevent seed production. As stated above, if the plants are very thick the field should be plowed even at the sacrifice of the clover hay crop. If the plants are merely scattered throughout the field they should be cut off with a hoe and if the seeds have already been formed the plants should be carried off the field, piled up, and burned when they are sufficiently dry.

Wisconsin College of Agr. A. L. STONE.

Ropy Milk

Kindly tell us the cause of stringy milk. The milk is apparently all right when drawn from the cow, but after setting awhile becomes stringy.

Mankato, Minn. J. C. M.

We anticipate that the trouble described is what is known as ropy milk and is caused by bacteria which get into the milk from outside sources. Sometimes this source of infection may come from the water in which the cans or milk utensils are washed; sometimes from the water in the cooling tank, and sometimes from the bacteria which the cattle may pick up on their udders and bodies by wading through marshy ground or other wet places. Sometimes it may come from a stable infection, but this would be very unusual. About the only method to pursue is to exercise particular care that all milk utensils are thoroughly sterilized with boiling water and are then allowed to dry out thoroughly, either with artificial heat or by standing in the sun.

If this does not overcome the trouble, the next point of attack would be to see that the cooling tank is thoroughly cleaned out and preferably disinfected with a 12-ounce can of chloride of lime, or bleaching powder, to 100 gallons of water. As an additional precaution, all milk utensils might well be immersed in this solution. If neither of these treatments removes the trouble, then recourse should be had to keep all possible contamination away from the cows and out of the milk.

It might be possible that the water tank is the source of the infection, in which case it would be necessary to clean and disinfect this. The infection may come through the cows wading through wet places in the pasture, and the only proper procedure then is to restrict the cows from such areas. In addition, it would be well to see that the cows are thoroughly brushed off and possibly the udder and flanks washed in a disinfecting solution somewhat similar to that used for the milk cans. In all cases where the disinfecting solution is used, care will have to be exercised that it be properly rinsed off or time permitted for the odor to evaporate; otherwise, the milk will take up this odor.

It should be understood that the exposure to heat or to disinfectants leaves nothing on utensils which will prevent the growth of ropy milk organisms if they find their way to the utensils after such treatment. In actually carrying out such a disinfecting campaign at the farm, it occasionally happens that some pail, dipper, or other object which has been in contact with the ropy milk is overlooked. If, in connection with the handling of the milk, the germs on this one utensil spread to the others, the result of the disinfection is lost and the trouble will reappear in the milk. Fortunately, in handling actual outbreaks, the trouble rarely reappears where the work has been carefully done.

A Father and Son Farm

Many fathers would give their sons a definite share in the farm business and endeavor to keep them at home if they could find some satisfactory share basis. The following suggestions are made primarily with the father and son problem in mind but they are also applicable to others.

1. Give the son a certain share of the returns from the sale of crops and other farm products as well as a share of the increase in value of live stock. In return the son would perform all or a certain part of the labor. For example, if a son agrees to do all the farm work, or hire what is needed in addition to his own, his share might be fixed at one-fourth of the gross returns.

2. Let the son supply all the labor and the father sell him a half interest in the live stock, machinery, and supplies, in fact, everything except the land. The son would sign a note for the amount at a nominal rate or without interest as might be decided upon. Each party might then agree to accept one-half of the returns and pay one-half of all expenses except taxes on the land and cash outlay for upkeep of buildings, which would fall on the owner of the land, the father.

3. Form a stock company out of the farm business and give the son or each son a certain share in the stock company formed. One of the members would be responsible for the bookkeeping and for the handling of the finances and other members would have their work more or less clearly defined, depending on the size and character of the farm business. Each one employing his time on the farm would receive a wage as decided upon. This would vary with the time put in and the importance of his contribution toward the success of the undertaking.

When the father assumes all the expenses except man labor, as outlined in the first suggestion, the son is responsible for only a part of the expenses and may be inclined to spend too freely on machinery, supplies, and feed, being primarily interested in high gross returns, whereas the father is interested in net returns. This sort of an arrangement, however, is easily made and easily terminated as there is no joint investment and the son requires little or no capital. To a large extent the responsibility of management falls on the father.

In suggestion two, expenses as well as receipts are of equal importance to both parties as the net income for both depends upon the excess of income over expenditures. Each has an interest in the capital invested and on the whole it must be a more permanent arrangement if it is to be successful. The one disadvantage, so far as the son is concerned, in either of the first two suggestions is that he gets no share from increase of land values. He is less interested in making and keeping up improvements than the father.

The formation of a stock company as outlined in suggestion three overcomes this and tends to include the good features of suggestions one and two. The son shares in all income, whether from land or direct farm operations. Losses due to any cause must also be shared, also the payment of a certain wage based upon his contribution in the way of labor or management gives him something definite. The wage received may be small but it should be relatively as large as that received by the father. Careful records are necessary so that a detailed financial statement may be worked out at the end of the year.—N. D. Bulletin 171.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

WAYSIDE MUSINGS

Mystical Side of Life

JOSEPH S. MORRIS, WISCONSIN

ONE does not need to argue that this is a time in which knowledge is held in high esteem. There is a thrill that comes to a man when he can say about some important matter: "I know." It means that he no longer speculates, nor guesses, nor theorizes. He has gathered together certain facts—used those facts—and they have worked. He is master of at least one thing.

In every line of human endeavor life is challenging men, as never before, to be men who "know". Schools, colleges, universities, specialized schools, and extension courses are aiming as never before to put men into their chosen field of work with such knowledge as shall make them capable of succeeding.

But man cannot build a complete and perfect small world of his own and shut all else and everybody else out of it, nor does he wish to do it. There is a mystical side of life that is made of dreams, and music, and poetry, and beauty. No one man has a monopoly on it. Man reaches outward, outside of himself, and upward toward something that is higher than himself. One of the writers in the Bible speaks of: "Things which eye saw not, and ear heard not, and which entered not into the heart of man. Whatsoever things God prepared for them that love Him." 1st Cor. 2:9.

St. Paul, the writer, tells those to whom he is writing that he did not come to them in "persuasive words of wisdom", but in demonstration, through his life and acts; of a power that had changed his whole course. He was a learned man. He was familiar with many questions which puzzled men then, and still puzzle them. But he also realized that men must build their lives upon some foundation which they feel will last. That there is such a foundation he does not doubt—he knows.

In spite of all that "we know" there is also much that we do not know, and much that we know only in part. We have not begun to make full use of this religious side of life. There is a normal place in every robust life for dreams, for meditation, for prayer, for worship, and this mystical side of life should be cultivated. Sometimes the grind of life is so hard that we do not even lift our eyes to see the beauty around us, yet doing so would relieve the strain. Tennyson, the poet, makes this appeal:

"Speak to Him, thou for He hears, and Spirit with Spirit can meet—
Closer is He than breathing, and nearer than hands and feet."

Those whose lives are lived in the open have the opportunity of seeing and feeling much of the mystery of our world. There are beautiul scenes in wood, and field, and valley. There are splendid sunsets when the skies are wonderully tinted. There is the hush and the quiet when the mystical side of life asserts itself.

Some men work and do not think. Others think and do not work. But the thing that makes us or mars us is what we think about while we are working.

Bankers Support Dairy Show

Bankers throughout Wisconsin are backing the dairy industry in a thorough manner. This year, with the National Dairy Exposition opening in Milwaukee, the chief city of the state, on Sept. 27, the bankers are giving a real demonstration of their faith in the dairy cow.

The credit situation in the state has been so good, that when other states were borrowing from the finance organization of the federal government, Wisconsin had money to lend, it is pointed out. Milwaukee which secures much of its prosperity through the wealth the cow brings to the Badger farmer had a record of less unemployment than any large city in the last five years.

Wisconsin banks have been devoting large portions of their advertisements to the Dairy Exposition. With the lessons of better cows, better sires, cheaper feeding, improved machinery, work for the junior clubs, and the new department, "Feeding the Family" with its especial economy and health plea for the women and housewives of city and state, the bankers have been urging attendance at the dairy classic in Milwaukee on all citizens of the state and union. N. D. S. A.

Seed Corn for 1925

HOARD'S DAIRYMAN:—There will be a great shortage of seed corn the spring of 1925 unless extreme effort is put forth by every farmer and seed grower in the land. Many states are sounding the warning as they can plainly see the handwriting on the wall. Those states using the late maturing varieties of corn will harvest little seed.

It will be up to Wisconsin and other states using early maturing varieties of corn to furnish reliable seed next spring. Practically all corn will contain a large amount of moisture when harvested, and much corn will necessarily be harvested while it is yet in the dough stage.

No seed corn should be left in the fields after a heavy frost. It should be taken from the stalks at once and put in the dry room. Seed corn should not be piled up several ears deep. It should be put on hangers where the ears can have free circulation of air. All seed corn should be fire dried in the presence of good circulation of air. If fans can be run in seed corn drying rooms, it will help very much. All doors and windows of the seed corn room should be left open the first few days and until the corn begins to loosen up on the cobs.

Air dried seed will be of little value this year, as the process is too tardy to drive out the excess moisture. Only fire dried corn will be free from disease and of high vitality next spring. R. A. MOORE.

A New Jamesway Book Free to Dairymen

It May Save You Many Dollars!

Some of the Things This Book Tells—

- How to get a good dairy barn.
- How to remodel an old barn.
- How to get good ventilation.
- The Essentials of a Good Cow Stall.
- How to Give cows pasture comfort in the barn.
- How to judge a stanchion.
- How to feed cows for profit.
- How to insure "safety first" with the bull.
- How to make the cleaning job easy.
- How to water your cows in the barn.
- How to have better hogs and bigger litters.
- How to make more money from your hens.
- How Jamesway "Pay-from-Earnings" Plan pays for your equipment as you use it.

WE SELL DIRECT TO USER

And many other helpful pointers on cow, sow and hen problems.

If you are interested in bigger earnings from cow, sow and hen, there's a world of information for you in this new Jamesway book.

It's filled with ideas. Tells how Jamesway "Direct-to-Farmer" Service is cutting out needless labor costs and needless hard work in farming, and enabling folks to live better, happier and put away more in profits each year.

Find out how much Jamesway can increase your earnings? You can install Jamesway Steel Stalls, Pens, Drinking Cups, Litter Carriers, Poultry House Equipment, etc., at once, on "Pay-from-Increased-Earnings" plan.

Jamesway Service is given personally right on your farm by our local Jamesway man in your territory. Our new book tells about it. Send for your copy today. Use the coupon, or a postal to Dept. A.

"Jamesway" Helps Make Farming Pay

Why Poor Cheese

HOARD'S DAIRYMAN:—Although the annual consumption of cheese in the United States is increasing and the quality now consumed is considerable, it is small compared with what it would be if there were any real attempt made to cater to the tastes of the people and supply them with the kind of cheese they like. The cheesemakers inform me that most of the cheese is shipped in a green condition. In fact one cheesemaker tells me that he has seen Monday's cheese boxed and shipped on Tuesday, and this in spite of the three-day ruling. It is difficult to understand how intelligent men can act so foolishly in the face of positive warnings which have appeared in the dairy press from time to time. If you continue to do this, consumption is going to be interfered with.

The grocers who handle cheese, as a rule, do not pay much attention to quality, and are guided in their purchases almost entirely by the matter of price. Generally speaking, they will buy cheese at a quarter of a cent below the market price that the regular cheese buyer will not touch except at a big reduction. As a result, they are offered the culls and usually get them.

Another mistake the grocer makes is to wait until fall to lay in his stock, buying in a number of cases direct from the factory the green, uncured cheese which should not be eaten in less than 5 or 6 months.

The proper time to secure cheese for winter consumption is during the month of June, taking the cheese from the factory or buyer when they are 10 days or two weeks old and keeping them afterward at a cool temperature to develop flavor. If the cheese have a clean flavor and are purchased at a factory where there is a cool curing room (not over 65 degrees) they will turn out best if held for four or five months at a temperature of 50 degrees or lower, down to 32 degrees. The cool cured cheese develops a mild but distinctly "cheesy" flavor which is universally liked. The small cheeses weighing 10 to 15 pounds are the most popular. They are also the most expensive for curing. Such cheese reach the consumer without cutting and thus a saving of considerable waste is affected.

There is opportunity for factories with cool curing rooms to do a splendid business in catering to this local trade. Here and there one finds a grocer who has studied this part of his business with the result that his trade has grown enormously in this particular line. These men go direct to the factory and contract for their best cheese, even if they pay a slight premium. I would say to grocers, buy your cheese, if you can, from a factory with a cool curing room, taking the June cheese for winter use and September made for the following summer. Such cheese should always be paraffined when ten days old.

Cheesemakers that want to develop a market of this kind should be careful and honest. In talking with a large groceryman in Southern Wisconsin he said, "I have a serious complaint to make this season on account of excessively short weight on cheese, brought about, we believe, entirely through being shipped in far too green a state. It has meant a considerable loss to us financially and otherwise, as a large quantity of the goods has developed a bad flavor, undoubtedly on account of the heat having a much worse effect on immature cheese than it would if they were properly cured. Needless to add we are going to buy our cheese elsewhere." It is useless to throw the blame on the buyers and let it go at that. The buyer knows the danger of this sort of thing well enough and the fact that they buy and sell green cheese is proof enough that they will not act in the interests of increased consumption when it serves their purpose to do differently.

I fully agree with many that say the blame rests on the buyer. It is generally assumed that there is a temporary gain to the factory that sells green cheese. I believe the cheese buyer takes green cheese because he believes the market has an upward tendency and he will profit by the increase, and that he sells green cheese because he thinks the market has a downward tendency. One of the surest ways to lower consumption is to continue the practice of selling green cheese. This is going to bring on a depression by causing a lessening in consumption and causing stocks to accumulate. This has always caused the patrons of cheese factories millions of dollars through lower prices. This expense is always with us but we never seem to learn that by holding back the cheese we increase the scarcity, stiffen the prices, and at the same time encourage the consumption of cheese by giving it time to reach a better condition and so help to increase the active demand.

Illinois. C. R. BARKER.

GUARANTEED
to outlast any other farm fence

This new Square Deal, which outlasts any other farm fence, is marked with a *Red Strand*—always look for it. The *Red Strand* stands for: *First*, Copper-bearing steel, which, in itself, lasts at least twice as long as steel without copper in it; *Second*, Made by the patented "Galvannealed" process, which means 2 to 3 times more zinc than is found in the ordinary kind; *Third*, Superior Keystone construction which makes every rod uniform, firm and strong.

Buy only fence with the *Red Strand* marking—it gives many more years service—costs no more.

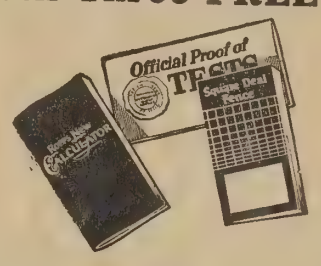
The Triple Life Wire
Galvannealed
Square Deal Fence
(No Extra Price)

There are only two known methods of making farm fence wire. One is the *ordinary galvanizing way*—the other is our newly patented "Galvannealed" process.

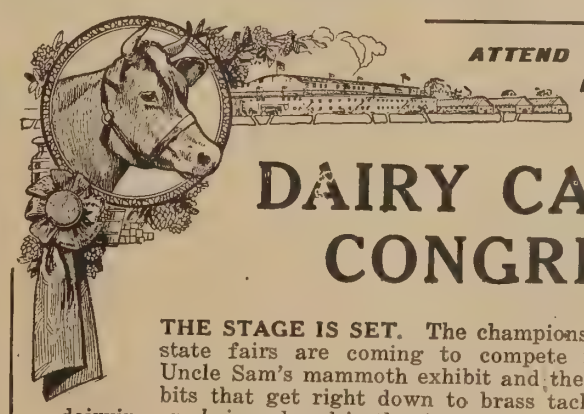
No one but Keystone can make fence wire by the "Galvannealed" process. No other fence wire is made that will give you the long extra wear that "Galvannealed" Square Deal is *guaranteed* to give—and it is sold to you at *no extra price.*

No other fence has all these big points: (1) Copper-bearing open hearth steel, "Galvannealed", rust-resisting wire gives Square Deal 2 to 3 times longer life. (2) Full gauge wires last longer. Square Deal Fence is never under gauge. (3) The famous Square Deal Knot absolutely will not slip—guaranteed. They hold line and stay wires with a firm grip. (4) Stiff stay wires, like pickets, require fewer posts. They hold Square Deal Fence tight and trim—no sagging. (5) Well crimped line wires, firmly gripped to the stiff stay wires, with the "knot that never slips" gives Square Deal Fence good live tension, secure against strains or sudden weather changes.

World recognized authorities such as: Indiana State University, R. W. Hunt Laboratories, Chicago, C. F. Burgess Laboratories, Madison, Wisc., all back up our claims that Red Strand "Galvannealed" Square Deal will far outlast any other farm fence. Copies of official tests will be sent upon request. They prove that the new Square Deal is the best and longest lasting investment you can make.



KEYSTONE STEEL & WIRE CO.
1741 Industrial St., Peoria, Illinois



Write today for (1) "Official Proof of Tests" which tells why you should buy "Galvannealed" Square Deal; (2) Ropp's Calculator which answers most questions on the farm. Figures costs, interest, gives measurements, contains commercial law and a lot of other data. (3) *Red Strand* "Galvannealed" Square Deal catalog, with fence sizes, descriptions, etc.

After reading these books and tests, you'll be able to judge how fence is made and what kind to buy. A postal from landowners brings—

ATTEND THE FRIENDLY SHOW

DAIRY CATTLE CONGRESS

THE STAGE IS SET. The champions from all the leading state fairs are coming to compete for supreme honors. Uncle Sam's mammoth exhibit and the scores of other exhibits that get right down to brass tacks on every phase of dairying are being placed in the dozen big buildings. Manufacturers will have every conceivable piece of equipment for the dairy farm and creamery on display. Worthwhile programs will be the order of the day.

IT'S ALL FOR YOU. To come and to see means clipping a dozen years from the school of individual experience in the barn at home. It's the time for that vacation you've been promising yourself and the family. You can't come too early nor stay too late.

Sept. 22-28 — Waterloo, Iowa

REDUCED RAILROAD RATES—a round trip rate of a fare and a half from Iowa, Illinois, Wisconsin, Minnesota, North and South Dakota, Nebraska, Kansas and Missouri. Ask for certificate for return if coming from outside Iowa.

It Pays to Advertise

Mr. William Wrigley, Jr., the chewing gum king of Chicago, in explaining the rapid growth of his company, said it was all due to advertising.

"But," interrupted one of his friends traveling with him to the Pacific Coast, "you have already built up a remarkable business. Why not save some of this advertising money and run along on momentum for a while?"

"Well," Mr. Wrigley said, "we have had a fine, fast trip west from Chicago so far. How much progress do you think we would make if they took off the engine?"—Empeco Paper News.

G-D Sanitary Seamless Strainers

Improved filter removes dirt. Solid drawn steel. Easy to keep sweet and clean. Full twelve-quart capacity. Will last a lifetime. "Send no money. Pay $2.00 and postage on receipt. *Money back if not satisfied.* Write for our free Dairymen's Supply Catalog.

Where lead
is a shield for steel

STREAKS of red stand out against the sky. Tiny figures suspended in midair cover the steel cables of the bridge with red-lead.

From the time the bridge is built, rust seeks to destroy it. Lead is the shield that protects the steel cables, girders, and beams from rust and prevents the bridge from becoming a death-trap. It keeps the bridge strong today, strong tomorrow, and for years to come.

Nearly twenty million pounds of red-lead are applied to metal every year in this country. Yet this is not enough. Rust still destroys millions of tons of steel. Between 1860 and 1920 the world's output of iron and steel was about 1,860,000,000 tons. Of this total it was estimated that 660,000,000 tons were wasted through rusting in use. Just as unpainted farm houses decay and crumble, so iron and steel, unprotected by paint, rust, and are soon ready for the scrap-heap.

Where red-lead saves metal

On the farm red-lead is an important factor in prolonging the usefulness of machinery and tools. Unpainted metal is an easy victim for rust. It is rust that causes many a farmer to spend money for repairs which could have been avoided by the timely application of red-lead paint.

This painter is risking his life to give the steel cables of the Brooklyn Bridge paint protection. He is putting on red-lead, the strongest shield that steel can have against rust.

Red-lead is necessary wherever iron and steel are. Railroads, gas and water companies and ship owners use red-lead constantly. They have found from experience that red-lead protection lowers the cost of maintaining iron and steel structures.

Red-lead keeps rust from attacking metal roofs, steam radiators, registers, pipes, fire escapes, fences, iron gates and exterior ornamental work of all kinds. It covers machinery, trucks, iron pipes, and metal equipment.

Red-lead has been used for generations as the standard protective covering for metal. Mixed with pure linseed oil, pure red-lead makes a paint that dries to a hard, tough layer and clings tightly to the surface. It is insoluble in water.

Red-lead should be and is usually used next to the metal in its natural orange-red color. It is tinted to dark colors for finishing coats for the sake of appearance or for inspection purposes.

A hundred pages of paint facts

If you want to know how to save the surface of metal, wood, or masonry on your farm with paint, write for our "Handy Book on Painting." This book is filled with essential paint facts and formulas and will be sent free at your request.

Producers of lead products

Dutch Boy red-lead is the name of the pure red-lead made and sold by National Lead Company. On every keg of Dutch Boy red-lead is reproduced the picture of the Dutch Boy Painter shown below. This trade-mark guarantees a product of the highest quality.

Dutch Boy products also include white-lead, linseed oil, flatting oil, babbitt metals and solder.

National Lead Company also makes lead products for practically every purpose to which lead can be put in art, industry, and daily life. If you want information regarding any particular use of lead, write to us.

Association Notes By Testers

Douglas Co., Nebr.: Three members are using milking machines, 10 have silos, and 9 are feeding some grain with pasture. The association is 100 per cent in pure-bred sires. Producers received $2.00 a hundred for market milk and 32 cents per pound for fat. Milk retails for 11 cents a quart and butter for 38 cents a pound.—J. T. Pierson.

North Eaton, Mich.: Where cows are on pasture at night, production is very noticeably increased. If more farmers had pasture such as sweet clover the production would be economically increased. The condensery paid 40 cents a pound for fat and the cream station, 37 cents. Milk retails for 8 to 10 cents; butter for 48 cents; and cheese, for 45 cents.—H. E. Frank.

Spencer-Perry, Ind.: Out of 288 cows tested during August, 64 made over one pound fat per day. Three members are building summer silos. The creamery paid 60 cents a pound for fat. Milk retailed for 12 cents a quart and butter for 55 cents a pound.—C. Baker.

Colesburg-Two-Co., Ia.: The association reorganized with 20 of the old members and 6 new. Some members have tried feeding grain on pasture for the first time and have done so with good results. The value of good clover pasture is very apparent when compared with June grass. The creamery paid 44 cents a pound for fat and butter retailed at 45 cents.—G. H. Crawford.

North Kent, Mich.: One modern dairy barn is under construction with complete equipment, including electric lights. Farmers receive $2.30 a hundred for market milk, with the condensery paying $1.55 a hundred and the creamery, 39 cents a pound for fat.—H. Hansen.

Traverse-Antrim, Mich.: One separator was found to be losing ½ of one per cent fat in the skimmilk. Two members had their soil tested, which was found to be acid. All members are having a good second cutting of alfalfa. One car of dairy cows was shipped to Missouri. Farmers received $1.75 per hundred for market milk. Milk retailed for 10 cents a quart and butter for 45 cents a pound.—R. J. Kaiser.
—R. J. Kaiser.

Ogle Co., Ill.: One new silo was built and drinking cups are being installed on another farm. There were 31 cows that made over 50 lbs. fat. Farmers received $2.50 a hundred for market milk, with the condensery paying $1.60.—J. Potter.

Hamlin, S. Dak.: Nine unprofitable cows were sold for slaughter and one cow sold for dairy purposes. Three members signed the accredited herd agreement for tuberculin testing. Thirteen members supplemented pastures with grain. The creamery paid 32 cents a pound for fat.—F. E. Hanson.

Verona, Wis.: A number of barns were whitewashed. One electric lighting plant was installed and one barn equipped with steel stalls. Farmers selling market milk received $2.10 a hundred, with the condensery paying $1.65, the cheese factory $1.41, and the creamery $1.85. Milk retails for 9 cents a quart; cheese, for 16 to 21 cents a pound; and butter, for 58 cents.—G. W. Weihing.

North Gratiot, Mich.: Thirty cows out of 221 produced over 40 lbs. fat during July. The average of all cows was 25.3 lbs. fat. The condensery paid $1.70 a hundred for milk and the creamery paid 44 cents a pound for fat.—C. H. Blivin.

Wisconsin Associations

Wisconsin reports 168 cow testing associations in operation as of July 1, 1924, an increase of 17 over the previous year. On that date it had 76,101 cows on test for 4,471 members, with an average of 27 herds and 453 cows to an association and an average of 17 cows to the herd. Fifty out of the 71 counties in the state now have one or more associations, Clark County heading the list with ten associations.

Cow testing work was started in Wisconsin in 1906 by the Wisconsin Dairymen's Association. Since that time over half a million cows have been placed on yearly test for some 33 thousand farmers in 1,143 regularly organized cow testing associations. The men actively engaged in the work are H. C. Searles (organizer of the first association), Erwin Sutton, and A. J. Cramer. It is

MICHIGAN'S HIGH HERD

The above cow is a member of the herd of seven pure-bred Holsteins owned by C. E. Burke that took first place among all herds in Michigan this year with an average production of 14,472 lbs. milk containing 513.6 lbs. fat. Last year this herd averaged 12,152 lbs. milk containing 425.5 lbs. fat. The cow shown above contributed 16,148 lbs. milk containing 623 lbs. fat to making the average for the current year. Mr. and Mrs. Burke are shown at the right, their son at the left, and Tester Hans Kardell at the rear.

from the latter's annual report that we glean the following data:

Production Secured Past Year

Reports were secured from 150 associations, 109 of which were able to report on a year's completed work. There were 49,372 cows in 2,943 herds that averaged 7,106 lbs. milk, 3.84% fat, and 273.2 lbs. fat. This illustrates the quality of the cattle and the service rendered by these associations, when we remember that the average cow in the United States is credited with 160 lbs. fat and the average cow in Wisconsin with 190 lbs. fat.

Figuring butterfat at 40 cents per pound, the average Wisconsin C. T. A. cow makes her owner $33.20 more money per year than the average untested cow. If all of Wisconsin's cows were as efficient as the average C. T. A. cow, this increase in butterfat value would put $73,304,400 more in the pockets of Wisconsin farmers each year. Under favorable conditions each of the 178,000 farmers in Wisconsin would then receive a $412 larger milk check from his herd each year.

Eighteen associations report an average yearly production per cow of over 300 lbs. fat, the Richfield Association heading the list with an average of 9,849 lbs. milk containing 341 lbs. fat.

There were 535 herds in 61 associations reported with an average of over 300 lbs. fat a year; or 18% of all herds. Twenty-five associations report one or more herds with a yearly herd average of over 400 lbs. fat, the herd of Leo Kuhl & Son of the Hazel Green Association leading the list with an average of 15,118 lbs. milk containing 534.5 lbs. fat for 13 pure-bred Holsteins.

There were 4,185 cows in 105 associations reported with a yearly production in excess of 365 lbs. fat, seventeen associations reporting one or more cows with records in excess of 600 lbs. fat. The highest producing cow for the year was found in the Kuhl herd. She is a pure-bred Holstein with a record of 22,914 lbs. milk, 3.66% fat, 839 lbs. fat.

Sires in Use

There were 190 grade or scrub bulls reported in use, or 5.1% of the 3,929 bulls in service. This is an excellent record as compared with the estimate of 60% scrub bulls in the state as a whole. Holstein bulls head 2,310 cow testing herds, or 63% of the 3,739 pure-bred bulls. Guernseys are second with 997 and Jerseys third with 195. During the year, 148 pure-bred bulls replaced grade sires, a total of 815 pure-bred bulls having been purchased by association members. There were 72 associations that reported no grade or scrub bulls in use.

Unprofitable Cows

During the year 5,542 cows were sold to the butcher as unprofitable, or 9.5%. There were 3,714 cows sold for dairy purposes, and 582 pure-bred bulls were sold on the basis of the cow testing association records of their dams. Advanced Registry testing is done by 98 members in 68 associations.

During the year 1,710 herds out of 1,429 were tested for tuberculosis, 1,325 of which showed no reactors. There were 1,304 herds on the state and federal accredited list as free of tuberculosis, or 39% of the 3,375 herds on which a report was received. There were 1,793 members reporting that sold whole milk as compared with 1,828 who sold cream.

Feeding Practices

Cows on pasture were fed grain in 2,310 herds, silage in 732 herds, and soiling crops in 423 herds. There were 2,363 members who grew alfalfa as compared with 776 who grew timothy for cow feed. Soy beans for hay was grown by 552, and for grain by 152. Commercial mixed feed was purchased by 1,482 members, with 832 buying feed co-operatively at an estimated saving of $15,328. Grain was fed to dry cows by 2,190 members, or 60% of those reporting.

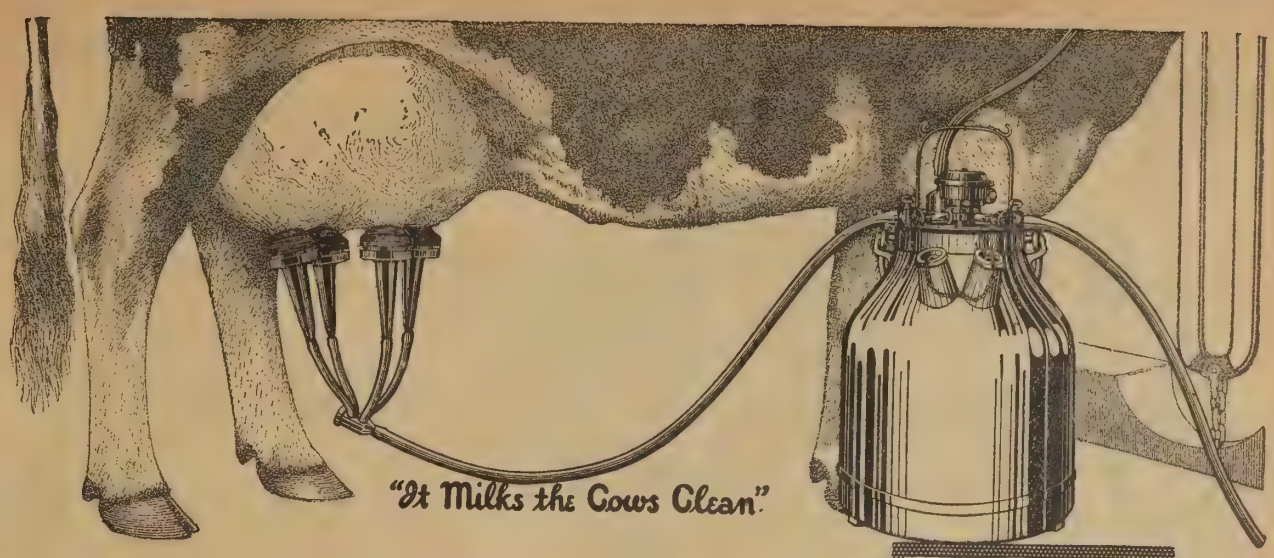
Activities of Testers

Testers in 51 associations report 176 retests on high cows. In 30 associations, 970 soil samples were tested. There were 54 testers that helped in organizing calf clubs and attended 134 meetings. Reports by 116 associations showed that they had held 313 meetings during the year. Testers made 6,393 skimmilk tests, finding 388 separators not operating correctly. Three associations made milk sediment tests. Forty-nine testers published a printed annual report of their associations, 88 helped to reorganize their associations, and 104 helped members in the sale of surplus cattle.

Equipment on Farms

The following is a partial statement of how the 4,000 farms of members reported on were equipped:

Buildings: 3,743 members owned 4,591 silos; 1,856 had milk houses; 552 had ice houses.



Barn Equipment: 1,884 whitewashed interior; 1,007 had milking machines; 2,600 had drinking cups; 1,267 had ventilation; 2,775 had steel stalls; 1,191 had electric lights; 3,723 had autos; 675 had trucks; 1,289 had tractors.

House Equipment: 1,191 had electric lights; 1,069 had running water; 662 had bathrooms; 3,427 had phones; 247 had radios; 1,394 had furnaces; 1,158 had power washers; 642 had electric or gasoline flat irons; 93 had pressure cookers; 39 had tea carts.

Purchases Made

The following was new equipment purchased and on which a report was asked: 288 members installed drinking cups; 80 installed barn ventilation; 206 bought steel stalls; 167 bought milking machines; 229 built silos; 73 built milk houses; and 67 built barns.

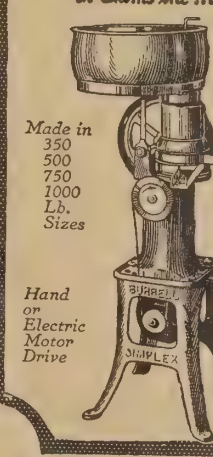
Says Sam: Brevity but not abruptness is the best telephone manners.

Four Reasons
Why You Should Buy a Burrell

In choosing a milking machine, set your standards high. Demand that it milk your cows clean, that it develop the milk-giving ability of your cows and that it draw the milk in a sanitary way. These are the prime requisites of correct milking—all other features are either incorporated in them or are secondary to them.

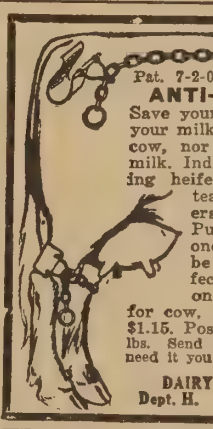
"But", you ask, "are all of these demands obtainable?" They are—in the Burrell Milker. And the four mechanical features which make them obtainable constitute *four reasons why you should buy a Burrell.* They are: (1) The Burrell Positive Relief Pulsator which produces sharp, definite periods of relief and suction on the teats; (2) The Burrell Automatic Controller which regulates the suction to the requirements of the individual cow or to the need of any cow at any particular point in the milking; (3) The Burrell Air-Cushion Teat Cup which, by means of the cushion of air, compresses and supports the teat so as to avoid inflaming the tissues; (4) The Burrell Moisture Trap which makes it impossible for moisture to travel back from the vacuum line into the milker pail.

If you will maintain your demands for the utmost obtainable in a milking machine, you will buy a Burrell. It is backed by more years of experience than any other power milker on the market, and stands today as the most perfect. And an installation will cost you less than you probably think. Moreover, the Burrell Milker will prove profitable on a fewer number of cows than you may think. Besides, the Burrell way is the perfect way to milk. Let us talk it over.



Send today for the Burrell Milker Catalog.
Address Dep't. 10.

D. H. BURRELL & CO. INC. LITTLE FALLS, NEW YORK



We Want To Tell You About This Separator

This machine represents the last word in cream separators. First, it is a remarkable skimmer. Then it is light-running and extremely simple. The quality throughout is what you would expect in a Burrell product.

FACTS ABOUT A FAMOUS FAMILY

Little red schoolhouse, good-bye!

Gone is the isolation of the rural home; going too is the little red schoolhouse.

The motor bus has made possible the consolidated school—modern, sanitary, with better trained and better paid teachers—serving families for miles around.

Today there are more than 14,000 consolidated schools, to and from which motor buses daily carry several hundred thousand pupils. In no other part of its product does General Motors feel greater pride than in the service of those GMC buses which help carry young America to school.

GENERAL MOTORS

BUICK · CADILLAC · CHEVROLET · OAKLAND
OLDSMOBILE · GMC TRUCKS

General Motors cars, trucks and Delco-Light products may be purchased on the *GMAC* Deferred Payment Plan. Insurance service is furnished by General Exchange Corporation.

SLEEPER'S MAID, SENIOR AND GRAND CHAMPION JERSEY COW AT WISCONSIN STATE FAIR
OWNED BY A. H. GOSS, MICHIGAN

Jersey

Judge: R. S. Hulce, Wisconsin.

Bull 3 years old or over—F. D. Underwood, Wisconsin, on You'll Do's Handsome Raleigh. Bull 2 years and under 3—The Oaklands, Michigan, on Blond's Xenia Sultan. Senior yearling bull—E. A. Douglas, Wisconsin, on Salonica's Fancy. Junior yearling bull—W. S. Dixon, Wisconsin, on Jap's Giltedge Chief. Senior bull calf—F. D. Underwood, Wisconsin, on Fewacres Bill Dod. Junior bull calf—The Oaklands on Vedas Oxford Witch.

Senior and grand champion bull—The Oaklands on Blond's Xenia Sultan. Junior champion bull—F. D. Underwood on Fewacres Bill Dod.

Cow 5 years old or over—The Oaklands on Sleepers Maid. Cow 4 years old and under 5—Cedar Crest Farm, Illinois, on Raleigh's Value. Cow 3 years and under 4—W. S. Dixon, Wisconsin, on Gipsy Lassie Anonan. Heifer 2 years and under 3—The Oaklands on Xenia's Bowlina. Senior yearling heifer—W. S. Dixon on Number 232. Junior yearling heifer—W. M. Knight, Wisconsin, on Majesty's Ixia's Orange. Senior heifer calf—The Oaklands on Oakland's Jersey Pride. Junior heifer calf—P. G. Warmington, Wisconsin, on Oxford Raleigh's Madge.

Senior and grand champion female—The Oaklands on Sleeper's Maid. Junior Champion female—W. M. Knight on Majesty's Ixia's Orange.

Aged herd—The Oaklands. Young herd—The Oaklands. Calf herd—The Oaklands. Get of sire—The Oaklands. Produce of dam—P. G. Warmington. Four cows in milk—The Oaklands.

CAVALIER'S PING PONG, SENIOR AND GRAND CHAMPION, AYRSHIRE BULL AT WISCONSIN STATE FAIR
OWNED BY ADAM SEITZ & SONS, WISCONSIN

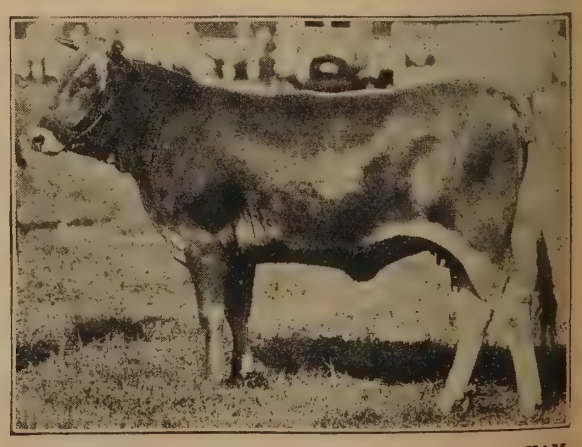
Ayrshire

Judge: A. J. Cramer, Wisconsin.

Bull 3 years old or over—Adam Seitz and Sons, Wisconsin, on Cavalier's Ping Pong. Bull 2 years and under 3—Adam Seitz and Sons on Cavalier's Sherry Redmand. Senior yearling bull—Daniel Hanrahan, Jr., Wisconsin, on Ace of Hearts. Junior yearling bull—H. M. Wallis, Wisconsin, on Champion of Wallis Farm. Senior bull calf—H. M. Wallis on Bruce of Wallis Farm. Junior bull calf—Adam Seitz & Sons on Spring City Fashion Plate.

Senior and grand champion bull—Adam Seitz and Son on Cavalier's Ping Pong. Junior champion bull—H. M. Wallis on Champion of Wallis Farm.

Cow 5 years old or over—H. M. Wallis on Lucindy of Spring Castle 2nd. Cow 4 years old and under 5—Adam Seitz and Son on Cavalier's Luxury. Cow 3 years old and under 4—Adam Seitz and Son on Cavalier's Lixxie Lindsay. Heifers 2 years old and under 3—adam Seitz and Sons on Cavalier's Stuart Queen. Senior yearling heifer—Adam Seitz and Sons on Cavalier's Silver Actress. Junior yearling heifer—Adam Seitz and Sons on Cavalier's Darling. Senior heifer calf—Adam Seitz and Sons on S. C. Red Lola. Junior heifer calf—Wm. Nisbet and Son, Wisconsin, on Daisy of Fernbrook 2nd.



Senior and grand champion female—H. M. Wallis on Lucindy of Spring Castle 2nd. Junior champion female—Adam Seitz and Sons on Cavalier's Silver Actress.

Aged herd—Adam Seitz and Sons. Young herd—Adam Seitz and Sons. Calf herd—Adam Seitz and Sons. Get of sire—Adam Seitz and Sons. Produce of dam—Adam Seitz and Sons. Four cows in milk—H. M. Wallis.

Brown Swiss

Judge: Geo. Humphrey, Wisconsin.

Bull 3 years old or over—Jubilee Farm,

MARVEL M'S 2ND HAZEL, JUNIOR AND GRAND CHAMPION BROWN SWISS HEIFER AT WISCONSIN STATE FAIR
OWNED BY N. C. SCHMID, WISCONSIN

Illinois, on Jubilee Brownie Boy. Bull 2 years and under 3—N. C. Schmid, Wisconsin, on College Lee. Junior yearling bull—N. C. Schmid on Maiden's Vronicka's College. Senior bull calf—N. C. Schmid on Nelliemilitor. Junior bull calf—Lila Schmid, Wisconsin, on Maiden's Master.

Cow 5 years old or over—N. C. Schmid on Cinnamon's Maiden. Cow 4 years old and under 5—N. C. Schmid on Mollie's Nellie. Cow 3 years old and under 4—N. C. Schmid on Insurance Rosa. Heifer 2 years old and under 3—N. C. Schmid on Brown Ethel. Senior yearling heifer—N. C. Schmid on Marvel M's 2nd Hazel. Junior yearling heifer—N. C. Schmid on Mernervie of Meadow Green. Senior heifer calf—Jubilee Farm, Illinois, on Jubilee Eldred Springtime. Junior heifer calf—Jubilee Farm on Jubilee Medor Penelope. Senior champion bull—N. C. Schmid on College Lee. Junior and grand champion bull—N. C. Schmid on Maiden's Vronicka's College Boy. Senior champion female—N. C. Schmid on Cinnamon's Maiden. Junior and grand champion female—N. C. Schmid on Marvel M's 2nd Hazel.

Aged herd, young herd, calf herd, get of sire, produce of dam—N. C. Schmid.

Four cows in milk—N. C. Schmid.

What Becomes of 559 Student Judges

The sixteenth annual students' cattle judging contest will be held at the National Dairy Exposition, opening in Milwaukee, Wis., on Sept. 27. A resume of the work done in past years by federal agricultural authorities shows some interesting facts concerning those who have taken part in these contests.

A total of 559 student judges who competed have been reported on. Of this number, the occupation of 56 is unknown, and 10 have died, leaving 493 for which information is available. One hundred seventy-eight, or thirty-six per cent are engaged in educational work. Of these, 18 are professors and 5 assistant professors in agricultural colleges; 13 are instructors or assistants; 17 are engaged in extension work; 8 are with the U. S. Department of Agriculture, and the remainder are instructors in agricultural or extension work other than animal husbandy or dairying. There are forty-five county agents. A total of 167, or 34 per cent are practical farmers; 12 are in public service work; one is president of a breed association; two are secretaries of such organizations; 10 are in the creamey business; 3 in the dairy supply business; 5 in the ice cream business; 8 in the retail milk business; 4 dairy inspectors, and one secretary of a state dairy association.

This year, in connection with the national Dairy show in Milwaukee the sixteenth annual students' judging contest will offer similar opportunity for teams of three men each to represent their respective colleges. Besides the experience obtained in judging cattle, there are valuable prizes being offered, including two $400 scholarships, 7 silver trophies, 3 medals, 1 plaque and 3 canes.

Minnesota Dairy Courses

W. B. Combs, professor of dairy husbandry, will have charge of the annual dairy short courses of the University of Minnesota which will be held at University Farm, St. Paul, Minn., as follows:

Advanced ice cream makers, nine days, November 17 to 26.

Advanced creamery operators, two weeks, December 1 to 13.

Creamery operators, six weeks, January 5 to February 11.

Members of the dairy division faculty at University Farm and men prominent in the manufacturing of dairy products will compose the instructional staff. The facilities for the three courses will be better than ever. The new dairy building, fitted with special laboratories and thorough modern equipment, will be available for use. Instruction in the manufacture and handling of butter, cheese, ice cream, and market milk will have the advantage of all modern devices.—Minnesota College of Agriculture.

Maryland Dairy Courses

The Maryland College of Agriculture offers a one week's course in testing milk and cream, December 29th to January 3rd; and a four weeks' course in dairy production or dairy manufacture, January 5th to 31st., 1925.

The purpose of the testing course is to supply milk and cream testers for milk plants and creameries; the production course to provide cow testers for Association and Advanced Registry work, and provide farm boys with information concerning dairy improvement; and the manufacturing course to supply training to those interested in farm butter making and in factory work.

The requirements for entrance are that the applicants be at least 18 years of age and have a good common school education. No entrance examination is required. Persons having practical experience on the farm or who are working in milk receiving stations or milk plants should derive the greatest benefit from these courses. No tuition is charged to residents of Maryland. A fee of $5 to cover cost of materials supplied in the various laboratories is assessed in this three weeks' course.

Room and board may be had with private families for from $10 to $15 per week. For additional information address inquiries to Dairy Husbandry Department, Unversity of Maryland, College Park, Maryland.

Uncle Ab says the man who is too easily satisfied has a pretty dull life.

Re-roof for the last time

No expense for tearing off the old shingles. You can start right to work laying your new roof. Picture shows the beautiful effect produced by the Hexagonal Method of laying Asbestos Shingles.

Nearly fifteen years ago Johns-Manville Asbestos Shingles were laid right over the old roof of the Garden City hotel, Long Island. In all that time it has never needed repair.

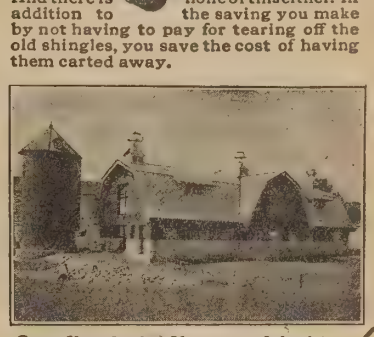
The severe blow-torch test never fails to convince of the absolute fire-safety of Johns-Manville Rigid Asbestos Shingles. Ask your fire-chief about this.

—right over the old shingles

JOHNS-MANVILLE was the first to recommend this method, after a twelve year test, as the most practical and economical way to get a permanent Asbestos Roof. Hundreds of farmers have benefited byit.

The success of this Johns-Manville method has been so great that others have taken up the cry and often recommend unreliable materials for re-roofing in this way.

Remember this:—Be sure you lay some type of Johns-Manville Asbestos Shingles over the old roof. In that way you will insure your roof against fire and weather—and you will never have to re-roof again.



With Asbestos Shingles you need never fear that sparks on the roof of your barn will set it on fire. Johns-Manville Asbestos Shingles will protect your live stock and crops for generations to come because they are both fire-proof and permanent.

None of this when you don't have to tear off the old shingles. No broken flower gardens, nor littered lawns.

And there is none of this either. In addition to the saving you make by not having to pay for tearing off the old shingles, you save the cost of having them carted away.

One of hundreds of barns roofed with Johns-Manville Asbestos Shingles

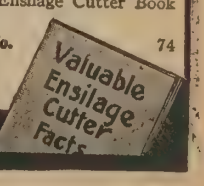
Kalamazoo
ENSILAGE CUTTER

The features that have made the **Kalamazoo the World's Standard Cutter,** will make it a profitable investment for you. It is safe, sturdy, fast, and unfailingly reliable.



- Lifetime, channel-steel frame;
- Unbreakable knife wheel;
- Centre shear cut;
- Triple feed rollers that insure steady feeding:
- Reversible shear bar;
- Absence of vibration;
- Rigid guarantee

Clean, Fast Cutting

This smooth, easy-running, non-clog blower will get your silage in at the right time and at low cost. One lever starts or stops it. Three sizes to meet every farmer's need. Special terms now. Write today for Ensilage Cutter Book and full particulars.

See Oakland First

BEFORE you settle on your next motor car, take a look at the True Blue Oakland.

Substantial improvements in design and performance make Oakland a wonderful selection for the hard grind of farm life.

Oakland's advanced L-Head design, six-cylinder engine is built of quality materials to precision limits unequalled in Oakland's price class.

Oakland open types have a stout, permanent top. All-season comfort at slight extra cost with Oakland designed winter enclosures. All Oakland bodies are Fisher-built.

All Oaklands are finished in Duco—wash them with a *dry* rag. All have time-proved four-wheel brakes. All have driving controls centralized on the steering wheel.

The True Blue Oakland is a bigger money's worth of performance and satisfaction for anybody's money. See it first!

A Year in Advance of Its Field

Advanced-design L-head engine
4-wheel brakes
Fisher Bodies
Duco body finish
Centralized controls
Disc steel wheels
Full balloon tires
Permanent top on open cars. Special glass enclosure at slight extra cost
New Fisher one-piece ventilating windshield on closed models
Automatic spark control
Unit instrument panel indirectly lighted
Precision manufacture unequalled in its class

Roadster Special Roadster Landau Coupe Coupe for Four
Touring Special Touring Landau Sedan Sedan

OAKLAND MOTOR CAR COMPANY

PRODUCT OF GENERAL MOTORS

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production.

The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

The American Home and Its Government

HOARD'S DAIRYMAN:—The American home in its ideal state is almost spiritual or divine. It is a true embodiment of faith, hope, and charity, the latter most of all. It, in its proper state, represents justice and liberty, justice to one another and willingness to go more than half way and no one shirking his own duties; liberty in everything in so far as it does not interfere with the liberties of others or that which is just or God's law. In most things, man's own conscience must be the first and most serious judge of his own actions. Such a home is of more value than any or all false gods of pleasure, greed, dominion, or lust can give. It is excelled by nothing but the divine home. It is this home some would destroy. Not being capable of taking up their responsibilities of a home, they would prevent others from doing so. Sometimes their methods are the most base and hypocritical.

The wolf in sheep's clothing is never more in evidence than in those measures advocating all kinds of new laws and changes in our government and constitution without due consideration and reason. Not that new principles should not be advocated by those who sincerely believe them. The one who advocates new things, even though unsound in principle, is usually a thinker, one of the many who would help to over-rule other false ideas. The agitator is not to be despised (if sincere) for we need more agitation. It is the false idea he may advocate that is to be spurned and turned down after due consideration. But the individual who hates to think, who is juggling his life away, is truly a thing to be spurned and despised. In his laziness of mind he is the real destroyer of our homes and our government. It is this large class who hate to think, who do not realize that new laws to reinforce the old constitution in the spirit of it, are necessary to prevent lust and greed from taking complete control.

Michigan. R. W. STEED.

No Intention of Misleading Farmer

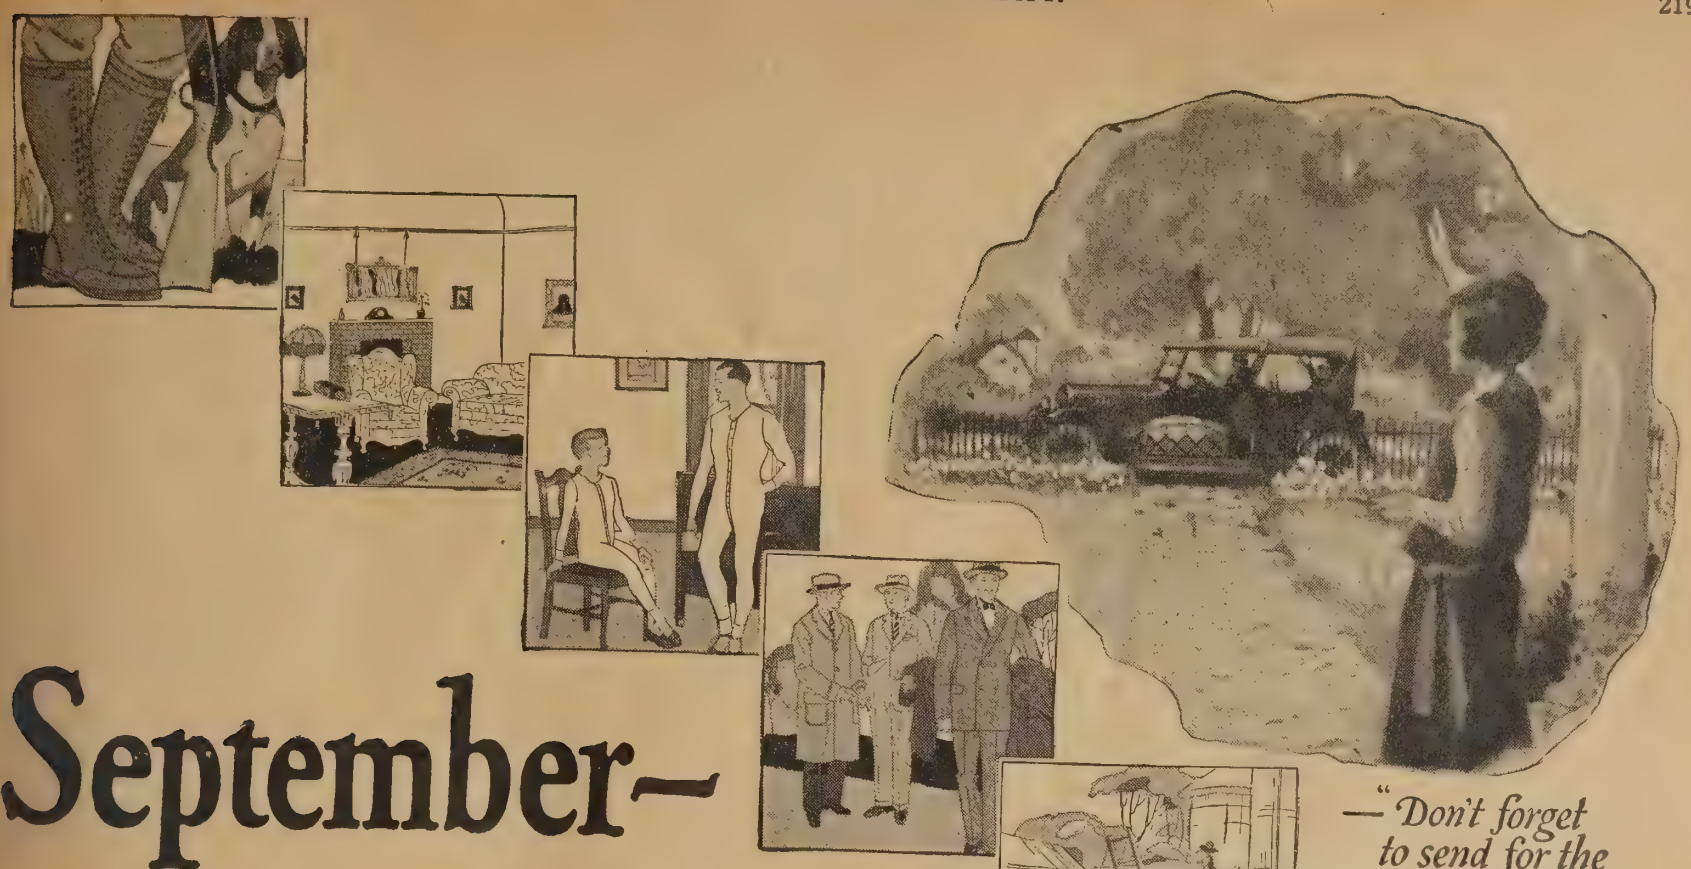
HOARD'S DAIRYMAN:—Answering V. E. Musgrove's letter in O. B. and B. columns June 20 issue, I have no intention of misleading the farmer and I feel that the farmer has too much at stake to afford to be misled by organized labor. All who labor, either with brain or hand, belong to the ranks of labor, hence you are right to the extent that the Farm Bureau is a kind of organized labor. It is unfortunate that a large part of our people have been organizing to protect or forward special interests but such is a fact and it now remains for the farmers to organize on local and commodity lines, have a national representative such as the Farm Bureau, and thus help to complete "The Vicious Circle". If one class gets more than it should have, another must take less and organized labor has been getting more than its share because of the unorganized condition of farmers and other members of our citizenship.

No labor organization should form a political party. The province of government is to keep the door of opportunity open to *all* of us and to do that it must see that no class gets more than its fair share.

The present policy of organized labor to restrict production, to compel the payment of excessive wages for inferior service, and to shorten the hours of labor unreasonably has caused the price of commodities to rise so high as to be beyond the limit of the farmers' purchasing power, as while labor is highly protected by our immigration laws and a high protective tariff and has an organization amply capable of taking advantage of the opportunity thus opened to them. The farmer has no such organization and his products are protected very slightly in said tariff and he must sell on a bear market and the largest bear he has to contend with is organized labor which gets him "goin' and comin' ".

During the war, when organized labor was dominant at Washington when it came to setting a price on wheat, they compelled the committee to set a price of $2.26 at Minneapolis when cash wheat was then selling there at $3.50 per bushel and they continued to harass the country by strikes for even increasing wages. During our last session of Congress organized labor was perfectly willing to allow laws passed that would aid the farmer in diversified farming (which means 12 to 14 hours per day against the 6 hours he demands) but when it came to the McNary-Haugen Bill, which would have afforded some temporary relief, they were instrumental in killing the bill. May the scales soon fall from the farmers' eyes and may they unite in an organization of their own.

Minnesota. H. E. O.



What Good Is the Pool?

HOARD'S DAIRYMAN:—It was with amusement that I read your editorial about the farmer that turned his cream separator backward and lost a lot of cream. I have seen a good many separators, and have never yet seen one that you could turn backward. If you think he lost a lot, what do you think about the dairymen that have pooled their milk? Why does not a dairy paper like yours expose such frauds?

In Wyoming County, New York, the Merrell-Soule Co. buys most of the milk. That company, for the month of June, paid to the pool $1.58 per hundred for 3 per cent milk. The pool paid the farmer $1.13 for the same milk. What became of the 45c? Butterfat for the same month was selling for from 41c to 43c in Buffalo, and I have the papers to prove this. $1.13 for 3 per cent milk would be 37⅔c for butterfat. The farmer, you see, lost about 4½c on every pound of butterfat, also all his skimmilk. Many farmers are paying 25c per hundred for hauling, which reduces the price to 88c per hundred or less than 30c for fat.

Is a combination of dealers and pool officials a benefit to farmers? The pool has been in operation over three years. Now if you or anyone else can tell me what good the pool is doing the dairymen, I will be anxious to hear it. Cheese factories or creameries pay higher prices than the pool does in western New York. The dairy business is doomed unless this combine can be broken.

How Extra Milk is Made

"Why do I get two extra quarts of milk a day from every cow on Cow Chow?", wrote a well known milk producer.

HOME grown feeds are necessary for cheap milk production, but they contain too much of some milk materials and not enough of others.

Adding the right amount of Cow Chow rounds out the home grown feeds so that they make the most possible milk and still keep the cow in good condition. Every one of the different materials in milk is provided in Purina Cow Chow. That's why it makes a half a gallon more milk per cow per day.

We don't ask you to believe it. We ask you to prove it. We'll supply the record sheets free and we'll lend you the milk scales to weigh the extra milk. Order Purina Cow Chow from your dealer. It makes more milk at a lower cost per gallon.

New "Z" Engine prices

19% *below* 1913 *level*

"Z" engine prices are lower than farm product prices *today*. Horsepower for horsepower, you can buy the famous "Z" with fewer bushels of wheat; less cotton; fewer hogs—than were required to buy the Fairbanks-Morse engine of 1913.

Remember, this is a genuine "Z", famous for its dependability—its economy. More than 1,250,000 horsepower now in farm service. Quantity production, engineering skill and careful manufacture have been combined to give you a better engine at a lower price. See the Fairbanks-Morse dealer in your town.

DAIRY MARKET NEWS

August Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers or 3.5 per cent milk delivered at factories during August is based on reports made by condensed and evaporated milk firms:

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$1.87	$1.87
Middle Atlantic*	15	1.64—2.62	1.83
South Atlantic	1	2.32	2.32
E. No. Central	70	1.44—2.60	1.63
W. No. Central	4	1.57—1.65	1.60
North Western	13	1.44—1.64	1.61
South Western	9	1.53—1.75	1.60
United States	113	1.44—2.62	1.66

*Sixty-one additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-two factories reported prices not determined, and nine reported plants closed.

The July price at factories in the Middle Atlantic Section not included in the previous report averaged $1.71 per cwt, for 3.5 per cent milk in the 201-250 mile freight zone from New York City.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for July:

	Range	Ave.
Condensed, per case	$5.20—$6.55	$5.76
Condensed, per cwt.	6.90—10.75	9.57
Evaporated, per case	3.35— 4.80	3.89
Evaporated, per cwt.	7.47—15.00	9.10
Condensed skim, per cwt.	4.50— 7.60	5.84
Evaporated skim, per cwt.	2.00— 7.60	4.08

Butter Prices for August

The following table is compiled from daily quotations by the U. S. Department of Agriculture and covers the average wholesale prices during August on 92-score butter (extras) at four of the principal markets, together with the receipts and storage holdings at these markets:

	Ave. Price Aug. 1924	Aug. 1923	Receipts Aug. 1924	Aug. 1923
	cents	cents	tubs	tubs
Chicago	36.6	42.9	341,811	249,679
New York	38.4	44.0	336,050	282,884
Boston	38.6	44.0	119,717	107,552
Philadelphia	39.1	44.9	95,017	78,112
Total receipts for August			892,595	718,225
Total receipts since Jan. 1			6,753,612	6,184,961
Storage holdings			1,376,533	836,886

Ninety-score butter averaged 35.3 cents for August in Chicago, with centralized butter at this market selling for 36.1 cents. Jobbers' prices on extras sold to retailers averaged 39.1 cents in Chicago and 42 cents in New York.

Butter Markets

(U. S. Department of Agriculture)

Butter markets nervous and unsettled during the week ending August 30. Scarcity of fancy quality the only sustaining influence. Production still running fairly heavy and prospects good for heavy fall make. Foreign situation important, with possibility of export rather than import, although no real business.

The average wholesale prices on 92-score butter for the week ending August 30, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Aug. 30 1924	Aug. 23 1924	Aug. 30 1923
	cts.	cts.	cts.
New York	38.6	39.1	45.0
Chicago	36.9	37.0	44.4
Philadelphia	39.2	39.8	45.7
Boston	39.0	39.3	45.0
San Francisco	40.7	40.2	47.0

The receipts of butter at these markets were 15,531,307 lbs. for the week as compared with 15,517,521 lbs. for last week and 13,552,674 lbs. for the corresponding week a year ago.

Cheese Markets

(U. S. Department of Agriculture)

Cheese markets steady. Most business at primary markets. Production said to have been temporarily reduced somewhat on account of weather conditions and flies. Distributing markets quiet and irregular.

The average wholesale prices on American cheese, style Twins, for the week ending Aug. 30, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Aug. 30 1924	Aug. 23 1924	Aug. 30 1923
	cts.	cts.	cts.
New York	20.7	21.0	25.7
Chicago	18.8	18.9	23.7
Boston	21.2	21.2	26.6
San Francisco	19.0	18.9	26.1
Wisconsin Boards	18.7	18.1	24.1

The receipts of cheese at these markets for the week were 4,368,757 lbs. as compared with 4,107,103 lbs. a week ago and 4,614,563 lbs. a year ago.

Cheese Markets

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese (style Twins) for three of the large markets in August.

	Average Price Aug. 1924	Aug. 1923
	Cents	Cents
Wisconsin Boards	18.5	23.1
Chicago	19.1	23.0
New York	—	25.1

Longhorns averaged 19.4 cents in August on the Wisconsin Boards as compared with 18.3 cents in July and 24.1 cents in August a year ago. The receipts of cheese at Chicago, New York, Boston and Philadelphia totalled 140,544,331 lbs. for the first eight months of the year as compared with 142,572,280 for the same period last year. Storage holdings at these markets on Sept. 2 were 24,321,519 lbs. as compared with 22,615,748 lbs. a year ago.

July Powdered Milk

(Report by U. S. Department of Agriculture)

Producers supplying powdered milk plants during July received from $1.55 to $1.75 a hundred for 3.5 per cent milk. These plants pay from 15c to 32c a hundred for skimmilk and from 6c to 18c a hundred for buttermilk.

During July powdered whole milk sold for 56c to 60c per pound as case goods and for

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

THE H. H. MILLER INDUSTRIES CO., CANTON, OHIO
successors to
Chas. Skidd Mfg. Co.
Janesville, Wis.

21c to 28c per pound in barrels. Powdered skimmilk sold for 40c to 44c per pound as case goods and for 6c to 12c a pound in barrels. Dried buttermilk sold for 8c to 10c a pound in barrels.

Philadelphia Milk Prices

The Interstate Milk Producers' Association announces that the September price for milk will be $2.94 a hundred f. o. b. Philadelphia and $2.19 a hundred at the 210-mile zone. This applies to the basic quantity. For class 1 August surplus, producers will receive $1.99 per hundred f. o. b. Philadelphia and $1.41 per hundred at the 210-mile zone. These prices are based on milk testing 3 per cent fat with a differential of 2 cents for each half point of test.

MILWAUKEE, Sept. 8—Butter—Creamery, extra, tubs, 37c; standards, 36c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 35@35½c. Ordinary firsts, standard cases, 34@34½c; miscellaneous lots, shippers' cases returned, candled, 31@32c; seconds, dirties, 23@24c; checks, 22@23c.

Cheese—American full cream, Twins, 19@19½c; Young Americas, 19½@20c; Longhorns, 19½@20c; Daisies, single, 19@19½c; American, 32c; Pimento, 34c; Swiss, 42c; brick, fancy, 17@18c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

CHICAGO, Sept. 8—The butter market today was steady with an unsettled undertone. Buyers were conservative and showed little interest, and as a result trading was quiet. Receipts were liberal and receivers as a rule were free sellers. The centralized car market was easy and in the buyers' favor. Offerings were liberal on all scores, but buyers were cautious and trading on the whole was quiet.

Fresh butter—92 score, 37c; 91 score, 36c; 90 score, 35½c; 89 score, 35c; 88 score, 34c; 87 score, 33c; 86 score, 32c. Centralized carlots—90 score, 36¼c; 89 score, 34¾@35c; 88 score, 33½@33¾c.

FOND DU LAC, Wis., Sept. 6—Average cheese prices, majority of sales, f. o. b. shipping point: Single Daisies, 19¾c; Double Daisies, 19¼c; Longhorns, 19¾c; Square prints, 20½c.

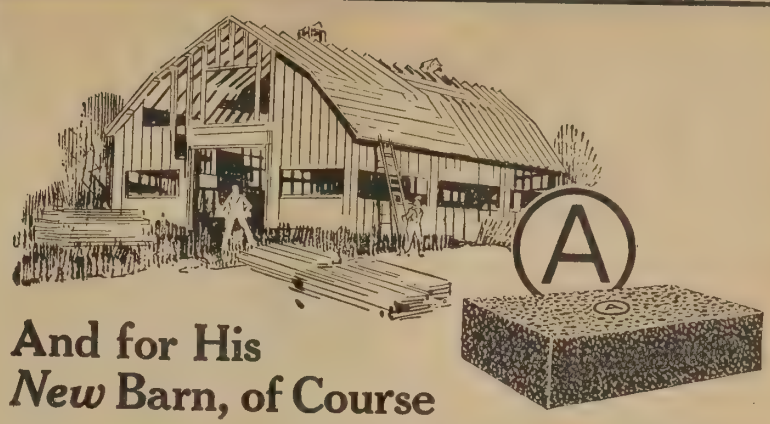
PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Sept. 6: Single Daisies, 18½c. On Farmers' Call Board, Sept. 6: Single Daisies, 18½c; Longhorns, 19c; Square Prints, 20c.

NEW YORK, Sept. 8—Butter easy; receipts, 5,671 tubs; fresh supply, 69,811 tubs; creamery, extras, 37½@37¾c; specials, 38¼@38¾c.

Eggs—Quiet; receipts, 7,107 cases; fresh supply, 69,062 cases; white, fancy, 55@58c; fresh firsts, 35@44c; western whites, 38@54c.

Says Sam: Sweet clover, unlike goldenrod, is no longer a weed to be sneezed at.

Grain Costs in North Dakota



The average cost of producing wheat in North Dakota this year was 81 cents per bushel according to a report just issued by Prof. Willard of the North Dakota College of Agriculture. The same report gives the cost of raising a bushel of rye to be 58 cents and the cost of flax, $1.49 a bushel. These estimates are based on approximately 100 records secured the fore part of August and well distributed over 10 counties of the state.

The costs listed above cover all costs, including rental charge for land and cost of seed, labor, machinery, threshing, taxes, etc. The estimate is based upon an average yield of 15.3 bushels per acre of wheat, 15.2 bushels rye, and 9.8 bushels flax.

New York Jersey Makes Notable Showing

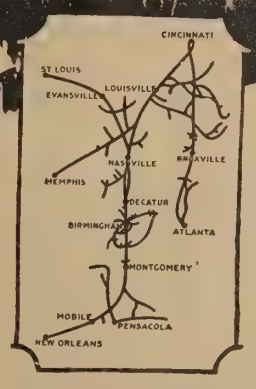
Bess Irene, a Jersey cow, owned by Mr. Geo. W. Sisson, Jr., recently completed a most creditable Register of Merit test. Irene commenced test at eight years, ten months of age and in one year produced 15,210 pounds milk, 916.92 pounds fat. Her average test was 6.03 per cent, mighty good considering that the average of the Jersey breed is 5.36 per cent. She was milked three times a day. This is Irene's third test, she having been first tested as a five-year-old, when she produced 515 pounds of butterfat. Then, as a seven-year-old, she produced 662 pounds butterfat.

One of her daughters, Sayda's Baron's Bess Irene, also in the Sisson herd, recently qualified for a silver medal when she produced, with calf, 651.49 pounds fat at two years, eight months of age.—The American Jersey Cattle Club.

And for His *New* Barn, of Course

JUST about the best testimonial of merit is a reorder. Mr. W. H. Butler, Woodside Farms, Columbus, Ohio, has used Circle A Cork Brick and orders more for his new barn. He *must* be satisfied. Here is his letter of May 28, 1924:

"Some years ago I equipped my cow barn floor with your Cork Brick, and have found it so satisfactory that I am installing it in my new cow barn. I wish you would RUSH shipment of enough brick to cover 630 sq. ft. of floor space."



Warm, dry, easy underfoot, sanitary, and durable—no wonder Circle A. Cork Brick floors are being used in more than *15,000 dairy barns.*

Get the 32-page illustrated booklet—Circle A Cork Brick. Sent free with a sample brick. Learn how easy it is to make your barn floor modern. Address Armstrong Cork & Insulation Company, 112 24th St., Pittsburg, Pa.

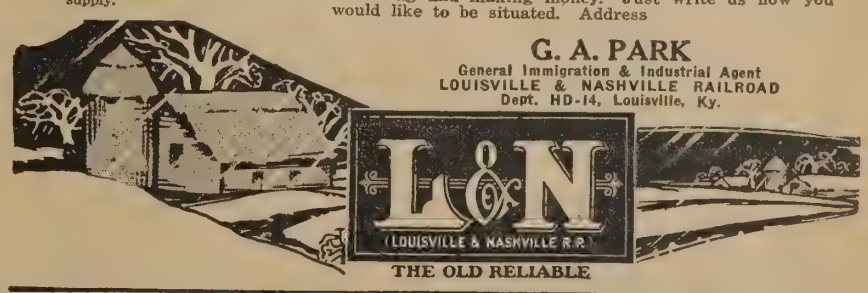
FOR DAIRY BARNS AND HOG HOUSES

Where Feed Costs Less!



The L. & N. Railroad serves a vast and rich agricultural territory from the Ohio River to the Gulf of Mexico. Along or near its tracks are many communities where dairying and stock raising are highly profitable industries — and where the demand for the products is greater than the supply.

Feed is one of the biggest items of expense in running your business—especially if you have to buy it from someone else. Every extra dollar that you spend for feed means you have one less for profit at the end of the year.

The feed problem is simpler in the South. Here, dairymen and stock raisers can grow most all of the feedstuff they need; cattle graze on green pastures the year 'round, and stall feeding is reduced to a minimum. *Less for feed, more for profits*—that is one reason why dairying and stock raising is highly profitable in many sections of the South.

There is room and a welcome for you in the South. And the L. & N. Railroad will gladly tell you, free of charge, all about conditions and desirable localities for living and making money. Just write us how you would like to be situated. Address

THE OLD RELIABLE

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Danny Makes a Visit and Some Corn Trees

Foreword—This is the second of the series of short stories on the "Adventures of Daniel Dare". Last week he started up the ladder to the corn club championship of the county by selecting, with his father's help, his seed corn. Watch for the next Daniel Dare story.

Saturday at last. Gee, but the week had gone slow. 'Twas hard starting in school again after three months of outdoor life. Anyhow Daniel Dare thought so. At that, it had been rather an interesting week because in agriculture they had studied corn. Danny had told his classmates about the corn project at home and how he and dad had selected the seed. The teacher thought it great and urged all the boys to grow some corn all their own.

But why all this impatience about Saturday? Oh, that was the day Danny had set for his visit to learn all about curing seed corn. Chores and breakfast over, he jumped on old Prince's saddleless back, and loped off for Jud Brown's place several miles away.

"Hello, Jud," sang a youthful voice. Jud, walking toward the barn, stopped suddenly and turned square around in his tracks.

"Why, Danny! What in tunket be ye doin' here? Hain't lost, be ye?"

"No, indeed. I've got some seed corn to cure, and father said if I wanted to learn the best way I should come over to see you. Will you let me see how you store yours, Jud—please." Jud, though somewhat rough and unscholarly outside, had a heart inside as big as any man.

"Well, tain't much extry thet ye'll be a'seein', but I 'low ye've got the makin's of a champeen, boy. 'Tis true, I've had fool luck with th' corn, an' ef I c'n help ye in any way, then I'm yer Uncle Jud. When yer daddy was a leetle shaver, he used t' c'me over and set on th' hoss when I was a'plowin'—jest hitch yer hoss t' th' fence post. Thar's a leetle grass he c'n nibble at 'round about."

In the twinkle of an eye Danny had done as he was bidden, and was back at the side of his hero of the hour. Throughout the countryside Jud Brown was known as king of the corn growers. It was his specialty. His success had been due to an inborn love for the corn plant, and a consequent great desire for knowledge of the best methods, although his learnin' in other channels was somewhat limited.

The man led the boy to a small, well constructed, two-story frame building. They mounted a rather high step and entered the door. "Ye see, th' step's high 'cause we drive right up here to unload," explained Jud. "This here buildin' used to be part of th' old house. We jest moved her over here and built a new foundation under her. She's about sixteen foot wide and twenty-four long, I guess.

"Ye see, we got two floors here an' a cellar—cement floor in the cellar. These here floors ye see here are made open so's t' let the heat up an' giv' a good circulation of air."

Danny looked hard. He noticed that the floor he was standing on and the one directly overhead were both made of slats about two inches deep, an inch and a half wide, and spaced about an inch and a half apart. He also saw a window in each end of the building.

A "movie" of Danny making his corn trees. For tools he had a hammer, saw, square, pencil, bit and brace, and nails. He got a piece of 2"x4" about 3 feet long which he marked down the middle with pencil and square, then ripped in two with his saw. In the end of each piece he bored a small hole. Then he drove finishing nails about 4 inches in length into the four sides of both pieces. The nails were spaced about 4½ inches apart and driven at a slight upward angle (see upper right picture). He put a piece of baling wire through the hole in the top of the tree by which it could be hung from the rafter in the attic, a good way to fool the rats and mice. In the lower picture you see Danny proudly exhibiting one of his finished corn trees with a few ears on to show you how he did it.

"Th' upstairs is jest like this," and Jud led the way across and up the stairs. Danny noted the same arrangement. Up through the center of both floors and out through the roof went a stove pipe. Again Danny wondered. "Yes, we've got a couple of stoves down in the cellar," Jud went on.

"We husk right out in the field—the seed ears go in one part of the wagon box. Then we unload and bring the ears upstairs in a bushel basket. Cool nights we build a good fire in th' stoves, an let her go out durin' the daytimes. When we got the fire goin', we leave all the winders up and the door open, too, sometimes. Thet's so th' circ'lation of air will be good."

"Ye see, th' heat drives out water from these here ears, an' thet there water's got t' git out somewheres. Onct I left the winders down. The fust thing I knowed, th' corn begun t' git moldy. Well, we lay th' ears out on th' floor so's they git plenty of fresh air. It depends on th' weather, but with a dry spell, a couple weeks of this heat stuff dries 'em out pretty well.

"See them racks there?" He pointed to some wire fixings on the floor over in one corner and another pile overhead on the rafters. "We made 'em from fencin'. Jest cut 'em out and bent 'em thet way. When she's real wet weather we stick th' ears on them wires and hangs 'em up on these here nails so's they won't be in no danger of moldin'. Now let's go down cellar. 'S real hot up here under th' roof with thet sun beatin' down, ain't it?"

They went outside and into the basement. "Whee, it's nice an' cool down here." This from Danny. He saw the two small stoves used to heat the corn drying house, both connected to the one chimney. He learned that soft coal was burned in one, hard coal in the other, and corn cobs in both.

"Now, Danny," Jud said, "after th' corn gits good an' dry we jest let her set till we ship her out. When we're workin' in here real cold days, o' course we have a fire. But so fer as th' corn's concerned, tain't necessary only fer about two weeks. This here house will hold about five hundred bushel ef we crowd her. Others has different kinds of corn storin' houses. But ye've got only a small amount of corn to cure. Ef I was you I'd make some corn trees an' hang 'em up in yer attic."

Danny didn't know just what corn trees were—he thought corn always grew on stalks and not on trees. So old Jud very painstakingly told him just how to make these most convenient articles for curing corn. After that the two went up out of the cellar and Danny said, "Thank you very much, Uncle Jud, I'm going right home and make those corn trees before I forget your directions." So he untied Prince, jumped on his back, and galloped off.

"Wal, I snum! He's a right smart young feller," was Jud's remark as he watched Danny gallop away.

Waukesha Club Show

Hoard's Dairyman Juniors took a prominent part in making the recent Waukesha County (Wisconsin) Live Stock Club Round-up one of the most successful ever held.

August 9th was a busy day for some ninety boys and girls. They had to rise early, get their pets ready to be transported to the Waukesha pavilion, load and unload, groom them for the show ring, lead them before the judge, and when this was over get them loaded onto the truck and back home. To say the least, the dairy calf club show was the outstanding feature of the round-up. Eighty-two calves, representative of four breeds of dairy cattle, Holstein, Guernsey, Ayrshire, and Brown Swiss, made a large and impressive showing.

Judging commenced about eleven o'clock when the pigs were lead into the ring, fairly shining from the careful grooming which their youthful owners had given them. They had been washed, scrubbed and oiled. They had been trained by their owners to mind every guiding touch of the cane. It was evident that the prize winners had received their share of skimmilk and other dairy farm products to make them the slick looking animals that they were. Following the pigs came the bleating sheep, producers of wool and mutton. This concluded the morning's showing activities.

As we walked down along the long rows of slick dairy calves blanketed and waiting their turn, we found several old acquaintances and made some new ones. The calves were a dandy looking lot and the boys and girls were good caretakers. Most of the juniors stayed close to their calves, brushing, feeding, and looking after them. Such care as this makes prize winners and makes good future dairymen.

An hour for lunch and the boys and girls were back at the pavilion anxiously waiting for the dairy calf show to begin. But before the show ring activities commenced again, a treat was in store for the club members, their parents, and friends. For more than a half hour W. McNeel, Assistant State Club Leader, entertained the crowd with community singing and a splendid talk.

"The first calves to be led into the ring will be Ayrshires!" This announcement was from J. F. Thomas, Waukesha County Agent, and in charge of the club show. An announcement was also given to the effect that seven prizes would be given to the best showmen in a Showmen's Contest to take place immediately following the afternoon's judging.

Waukesha County has long been famous as the home of some of the finest Ayrshire herds in America. There are perhaps few Ayrshire club shows which would excell the exhibits at this round-up. For numbers, the Holsteins lead the breeds represented in the ring with the Guernseys a close second. The Brown Swiss breed had but one calf shown.

Here are the prize winners at the dairy calf show:

Ayrshire Heifers

1, Dan Hanrahan, Jr.; 2, Robert Seitz; 3, Eleanor Seitz; 4, Robert Seitz; 5, Geo. Simmons; 6, Mary Dalton; 7, Marvin Dalton; 8, Edward Price.

(Continued on next page)

Brown Swiss Calves

1, David Evans (only calf shown).

Guernsey Heifer Calves

1, Frank Fox, Jr.; 2, Frank Fox, Jr., (shown by Henry Swartz); 3, Albert Fruit; 4, Helen Boyd; 5, Donald Burton; 6, John Boyd; 7, Donald Burton; 8, Phil Longley; 9, Gaylord Noll; 10, Marjorie Love; 11, Eugene Griswold; 12, Lester Wendt; 13, Jack Longley; 14, William Haylett; 15, Charles Kuhtz.

Guernsey Bull Calves

1, Albert Fruit; 2, Wilbur Reid; 3, Donald Burton; 4, Elmer Wendt; 5, Frank Fox, Jr.; 6, Marjorie Love; 7, Donald Williams; 8, Jack Longley; 9, Howard Klein.

Grade Guernsey Heifers

1, Blanche Beggs; 2, Louis Sayles; 3, Everette Varley; 4, Raymond Varley; 5, Charles Garvens; 6, Howard Klein; 7, Sylvester Steele; 8, Robert Wiesenthal.

Holstein Bulls

1, Mitchell Karboski; 2, Joe McLay; 3, Alfred Garvens; 4, Harvey Swartz; 5, Roy Ebel; 6, Matthew Mungen.

Holstein Heifers

1, Gordon Brimmer; 2, Matthew Mungen; 3, Harvey Swartz; 4, Hubert Smith; 5, John Price; 6, Allen Shultis; 7, Richard Garvens; 8, Mitchell Karboski; 9, Melvin Stever; 10, Percy McFarlane; 11, Warren Swartz; 12, Florence Bagley; 13, Steven Cinky; 14, Wm. Klussendorf.

Grade Holstein Heifers

1, Glen Honeyager; 2, Geo. Werning; 3, Albert Werning; 4, Rollin Linck; 5, Roy Eble; 6, Arthur Brandt; 7, Percey McFarlane; 8, Warren Cruver; 9, Harvey Steele; 10, Reinhold Engler; 11, Herbert Lamp.

Showmen's Contest

1, Robert Seitz; 2, Frank Fox, Jr.; 3, Joe McLay; 4, Helen Boyd; 5, Sevent Cinky; 6, John Price; 7, Clifford Keppen; 8, Frank Swartz.

Dairy calf judges were R. S. Hulce, Lester Stevens, J. E. Stallard, Fred Southcott, W. L. Baird. Hogs were judged by E. C. Thompson, C. T. Hill, and William Muckleston, and sheep by M. H. Thornton.

WINNERS IN SHOWMEN'S CONTEST AT WAUKESHA CLUB ROUND-UP. THEY ARE LINED UP FROM RIGHT TO LEFT IN THE ORDER OF WINNING

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

See Hoard's Dairyman, issue of September 5, for a further discussion of the following:

Name the two essentials for the successful growth of sweet clover. A sweet soil (lime on sour land) and inoculation.

How much lime should be applied? Two tons of ground limestone are ordinarily needed per acre, but where very acid four or five tons may be required. Test your soil to determine its lime needs, don't guess.

What is the best variety of sweet clover? Biennial white sweet clover is best for dairy pastures. It is a sure "catch" when sown on sweet and inoculated soil. The seed should be scarified to break the hard coating in order that it may germinate more readily.

How much seed should be sown to the acre? Professor Fraser has had good results on his farm, sowing sweet clover at the rate of five pounds to the acre.

Tell about Hungarian Vetch. This is a comparatively new hay crop now being rather extensively grown in Oregon and other western states. It is a legume that will grow on acid soil, yields from two to four tons per acre, has a high feeding value, and is liked by the dairy cow; will survive wet winters and is aphis proof. Hungarian vetch came out victorious in a trial of some 400 varieties of vetch, begun in 1908 at the Oregon Experiment Station. (See "Hungarian Vetch in Oregon".)

What was the record of Lady Sylvia Barmstable? She was the only pure-bred female that Mr. McKnight of Connecticut ever bought. From her he built a pure-bred herd. She had 65 descendants born at Oakdale Farm. In thirteen years she dropped as many calves, was never sick, never lost a feed, never had udder trouble. Every calf but one was dropped in May, and this one was dropped in June. (See "Sixty-five from One".)

Junior Letters

Lives in Hundred-year-old House

Hoard's Dairyman Juniors:—I received the badge, creed, and button. I am very much pleased with them. My brother once joined the club. We have 30 cows that we are milking. I had a cow and sold her about two years ago. I received $75 for her and so I took part of the money and bought another calf. It is quite large now. We have a milking machine.

I am 12 years old. I live in Brandon, Vt., in a large stone house that was built in 1828. The secretary of the Ayrshire Breeders' Association lives in our town.

Vermont. Ralph Landon.

Yes, we know Mr. Burlingham, the secretary of the Ayrshire Breeders' Association. He is a very fine fellow. He was one of the editors of Hoard's Dairyman for several years. He recently told us that he lives in the newest house in Brandon, and it was built 34 years ago.

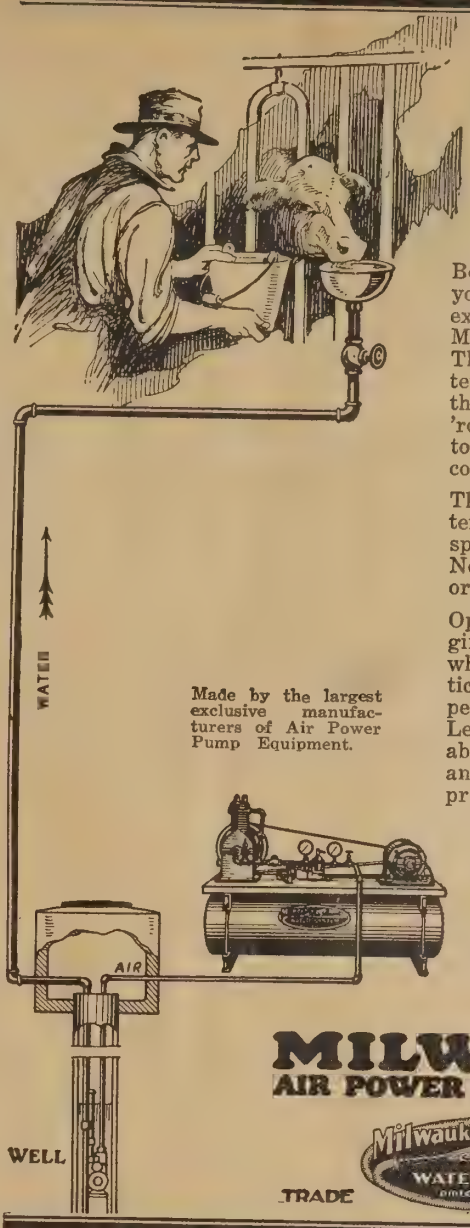
A Sewing Club Member

Hoard's Dairyman Juniors:—I live on a farm of 500 acres along Narragansett Bay. The house Nathaniel Greene lived in is about two miles from where we live.

Our school has a sewing club, and we named it the "Busy Bees". I am the president.

Three of us expect to go to Camp Edwards for a week. It is down at Kingston College.

We have made iron holders, aprons, nightgowns, bloomers, did some darning and now I am making a dress. I have been a junior for some time but I have never written before.



Rhode Island. Frances Eckhart.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Dairymen find-- this water system most profitable.

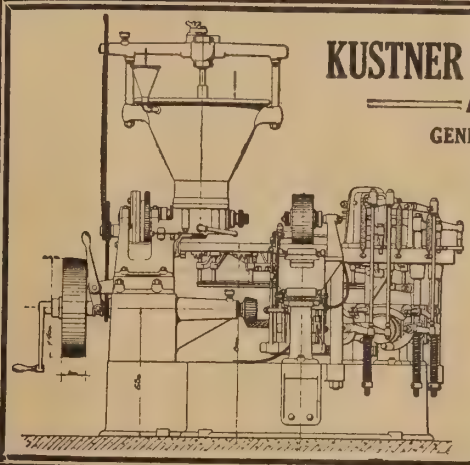
Before selecting a water system for your dairy farm let us tell you of the experiences of dairymen who have the Milwaukee Air Power Water System. The Milwaukee Air Power is the system that delivers water direct from the well, at well temperature the year 'round. This kind of water means 3 to 10 lbs. more milk a day from each cow and healthier, hardier stock.

The Milwaukee Air Power pumps water any distance direct from well, spring, lake, cistern or all of them. No water storage tank to become foul or freeze.

Operated by electric motor or gas engine. Power plant may be placed anywhere. Simple, dependable, automatic. Capacities 100 to 5,000 gallons per hour. For deep or shallow wells. Let us send you complete information about this exceptional water system, and explain why it increases dairy profits.

Made by the largest exclusive manufacturers of Air Power Pump Equipment.

Write today for 64-page catalog.



MILWAUKEE AIR POWER PUMP CO.

16 Keefe Ave., Milwaukee, Wis.

The rate for advertising in this department is 10 cents per word. Count address. Remit in advance. Copy must reach us 8 days ahead of date of issue. Farm labor advertising 7c per word.

STOCK FOR SALE

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12-*

For Sale—At "The Big Farm", Rosendale, Wisconsin, high grade and pure bred Holsteins by the carload. Also will help any buyer to select anything in dairy line in either Holsteins or Guernseys. JOHN MURPHY and JOHN FARRELL, Rosendale, Wis. (Formerly of Mukwonago, Wis.) 5-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha, Co., Wis. 11-*

Springers—10 Registered Holstien cows and heifers, cheap. AUGUSTINE BROS., Pound, Wis 19-*

Milk Producers—Let us figure with you on a load of Holsteins or Guernseys. Clean stock, heavy producers. Write or call EDGEWATER STOCK FARM, Fort Atkinson, Wis. 5-*

Waupaca County high grade Holstein and Guernsey cows and heifers for sale in carload lots or will assist you in buying. JENNINGS FARMS, New London, Wisconsin. 5-7

Springers—8 second calf, grade Holsteins, bred to a 930.80 lb. junior two year old record, show bull. Also registered bull and heifer calves from above sire. R. L. ANDERSON, Whitewater, Wis. 7-4

Fine Herd registered Holsteins to place on shares. FRED HARRIMAN, Appleton, Wis. 7-3

Forty Registered Holsteins. Any number up to carload. Good stock. Low prices. DR. HAINES, Three Rivers, Mich. 8-2

For Sale—Carload good Holstein springing heifers. E. E. LEWIS, R. 3, Racine, Wis. 8-3

Twelve Registered Holstein Cows for sale. A. NEILSON, R. 2, Waukesha, Wis. 9-2

Holstein Springers and fresh cows. W. STRAUSS, R. 5, Watertown, Wis. 9-4

Holstein Cows—Heifer calves, 200 head. Sacrifice prices. From heavy milk strain. WERNER FARM, Kenosha, Wis. 9-2

Ormsby-Homestead bulls $65. up. Dams up to 28 lbs. butter 7 days. EDW. RACE, Peshtigo, Wis.

For Sale—Registered Holstein cows, heifers or heifer calves. Accredited herd. Price right. GEO. DIEHL, Montrose, Ill. 9-2

We are Offering 18 grade cows to freshen this fall, and 3 Guernsey bulls. M. L. WELLES, Rosendale, Wis. 9-3

For Sale—Any part of fifty Guernsey females. Also a real good Guernsey bull. F. J. GLANVILLE, Lancaster, Wis. 8-4

Registered Guernsey Bulls nearing serviceable age. Best May Rose, Golden Secret breeding. A. R. dams, herd accredited. ALLIC KNUDSON, Brodhead, Wisconsin. 8-4

Registered Guernsey heifers and bull calves. FAIRVIEW FARMS, Brodhead, Wis. 13-*

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINELLO FARMS, Thiensville, Wis. 23-*

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

Young Guernsey Bulls, A. R. breeding. Federal accredited herd. MATH. MICHELS, Peebles, Wisconsin. 24-*

Two Serviceable Guernsey Bulls for sale. Dams have over 500 lbs. fat. Six bulls 6 months old. Dams and grandams average 697 lbs. fat. Sale list. HOMER RUNDELL, Livingston, Wis. 9-Spl

Ten Registered Guernsey heifers one and two years old. Accredited herd. W. H. PECK, Kent, Ohio.

For Sale—A few good grade Guernsey cows. Pick of herd. KENNETH MAULE, Dousman, Wis.

Registered Brown Swiss heifer calves wanted. SCHEIDEL BROS., Calmar, Iowa. 9-2

For Sale—21 two year old high grade Jersey heifers. Pasture bred to registered Jersey bull. I. F. SUTER, Box 242, Palmyra, Missouri. 9-4

STOCK WANTED

Wanted—Carload registered Holstein cows, GEORGE H. RUDY, Mattoon, Illinois.

STOCK BUYER

Save 30% on Guernseys and Holsteins. Not in the trust. J. D. POWERS, Fort Atkinson, Wis. 17*

Holstein-Guernsey—Will assist you in buying dairy cattle of any kind, grade or pure bred. GEORGE McELROY, Hortonville, Wis. 14-tf

DOGS

Send for Your Copy two hundred page illustrated dog book about world's largest kennels and it's famous strain of Orang Airedales specially trained as companions, watchdogs, automobile guards, stock drivers, hunters, retrievers. Ten cents postage brings book with price list of trained dogs, puppies, supplies, feeds, medicines, etc. OORANG KENNELS, Box 1, La Rue, Ohio. 2-*

Shepherd Pups—Guaranteed from best heeling stock. ALBERT HERRMANN, Norwood, Minnesota. 20-*

For Sale—Pedigreed Airedale pups. JANEHURST KENNELS, Waukesha, Wisconsin. 6-4

Collie and Shepherd pups. Heelers with nerve. Satisfaction guaranteed. Males and spayed females. $6.00 to $3.00. WILBUR DAY, Brighton, Iowa.

Hundred hunting hounds cheap. Trial C. O. D. BECKENNELS, H D W, Herrick, Illinois. 9-4

A Fine Litter of natural heeling Collie pups. Males $8.00, females $4.00. Also 1 brood bitch 2 years old, a good heeler, $15.00. GLENN J. BOYER, Orangeville, Ill.

SWINE

June Pigs—Pure bred Chester Whites, $10. DAVE SEXTON, Calderwood, Mich. 8-2

SILOS

Silo Bargain—12x20 Washington Fir Silo. Never erected. ALBERT C. WOLLIN, Johnson Creek, Wisconsin. 7-4

KODAK FINISHING

We Develop, print and enlarge your films. Send for price list and sample. FRAUTSCHY, Photographer, Monroe, Wis. 14-*

HONEY

Pure Honey. 10 lb. pail, $1.50; three pails (30 lbs.), $4.00. AMBROSE RIEFF, Mankato, Minn.

FARMS FOR SALE

Several well improved farms in Minnesota and eastern North Dakota can be rented on favorable terms by persons who have their own help and experience with livestock. Corn, alfalfa, hogs and dairying insure good earnings. For complete information and free book descriptive of the country, write to E. C. LEEDY, General Agricultural Development Agent, Dept. 82, Great Northern Ry. Co., St. Paul, Minnesota. 8-*

Just Out—Free picture catalog of Shawano, Oconto and adjoining county farms. Alfalfa, corn, potato and dairy section. Deal direct, no commissions. WISCONSIN FARMERS & HOMESEEKERS' SERVICE BUREAU, Marshfield, Wis.

Don't Rent—Buy my level dairy quarter, 6 miles County Seat 2,000. Big barn, alfalfa, etc., $60.00. HARRY L. PAGE, owner, O'Neill, Nebr.

Register and Secure a Farm—Hundreds have already started on our wonderful colonization plan. Come and see their fine new homes. We will also help you start in Wisconsin. You can get 40 or 80 acre dairy farm for only $100 deposit and balance in 10 years. Close to big towns. Many neighbors. Best, richest, gently rolling, Wisconsin clay loam. Only $2000 for 40 with nice house, good barn, best milk cows. A greater opportunity than a U. S. homestead. Particulars free. NATIONAL LAND COLONIZING CO., Dept. G7, Madison, Wis.

For Sale—53 acre dairy farm with good dairy business. Close to town, school, and hard road. Death in family reason for selling. Bargain if sold soon. For particulars write C. F. HARRIS, Mt. Vernon, Illinois, Rural Route 1.

For Sale—River bottom dairy farm of 186 acres, across the river from a town of 7,000 and short distance from two cities of 60,000 and 35,000. All good roads. Buildings are first class and equipped for dairy and stock farming. An excellent herd of 34 registered Holstein females. A young high producing herd. This herd is accredited. Well equipped with almost new machinery including two tractors. Retailing milk in town and never lower than 12c per quart. Two railroads within one mile and two miles. Milk station one mile and creamery two miles. Can grow anything on this soil. One of the rare opportunities seldom offered. Address BOX 275, care Hoard's Dairyman.

For Sale—120 acre dairy farm in Washington County, fine soil, good modern buildings, price $8500.00, $2,000.00 down. Will sell stock and implements very cheap. THOS. TONER, Route 5, Hartford, Wis.

Wisconsin Dairy Farm near Milwaukee, first class buildings, excellent soil, high test dairy herd; real bargain. E. HAWKS, 4406 Pabst Ave., Milwaukee, Wisconsin.

FOR RENT

For Lease—Model dairy farm fully equipped for certified milk. 18 miles from Washington. 200 cow barn capacity. Railroad station 1-4 mile from barn. Ample tenant houses. 100 acres of alfalfa. Annual milk receipts $40,000. Could be easily increased 50% to 100%. Leasing farm on account of death of owner. Executors can offer attractive proposition to experienced dairyman with capital. G. M. HUTCHISON, Sunset Hills, Virginia. 7-4

Dispersal Sale

ALDEBARAN FARM AYRSHIRES

One of the Largest and Most Noted Herds in America

AT ALDEBARAN FARMS

Racine, Wis., Thurs., Oct. 2 10 A.M

This is the day before the Ayrshire Judging, National Dairy Show, Milwaukee.

77 Registered Ayrshires

This herd has been assembled and bred by Mr. Stephen Bull during the past decade. Only the finest blood obtainable has been used, blending both show type with high milk production. Such an opportunity to secure FOUNDATION herd stock has not been offered in recent years.

Top Notchers

ALDEBARAN VICTOR — Champion bull of the Eastern circuit 1923. Out of Highland Polly, the highest priced cow of the Ayrshire breed in America, by Friendlesshead Victor. Has wonderful type, fine quality, unexcelled production pedigree.

AUCHENBAY DEWDROP—Prize winning A. R. cow Eastern circuit 1922. Senior two year old record 11,069 lbs. milk, 4.12% fat. Bred to Aldebaran Victor. Fresh by sale date.

HENDERSON'S BETTY 3rd. French cup winner 1923. Record 17,277 lbs. milk, 4.14% fat.

GLADYS OF RICHFIELD. A great milker. A. R. mature record 16,746 lbs. milk, 4.28% fat.

SPRING VALLEY LOUISA 3rd. A. R. Junior 4 year old record 14,247 lbs. milk, 4.66% fat. Note the high test.

ALDEBARAN MAID 2nd. A. R. mature record 12,737 lbs. milk, 4.25% fat. Good type and a great breeder.

Composition of Herd

BULLS—Five bulls of serviceable age including Aldebaran Victor and Aldebaran Magnificent.

COWS—Thirty-four mature cows. Fifteen of these cows are in the advanced Registry with enviable records.

BRED HEIFERS—Sixteen bred heifers 18 to 24 months old. Nearly all of them were bred and raised on Aldebaran Farm, and are the progeny of these good cows.

OPEN HEIFERS—Seven open heifers, 12 to 15 months old. A very handsome lot.

HEIFER CALVES—Eight heifer calves 3 to 10 months old. A classy bunch—four by Aldebaran Victor.

BULL CALVES—Seven bull calves, 4 to 8 months old. Six by Aldebaran Victor. This is your chance to get a real herd sire.

Out of thirteen Advanced Registry and Roll of Honor Ayrshire class leaders in Wisconsin, six of this number are in the Aldebaran herd and will be in this sale.

Show type as well as high production will be found here. Remember the Date—Thursday, October 2—during week of the National Dairy Show. SEND FOR CATALOG NOW

Lone Pine Guernseys

DISPERSAL SALE — Chicago Guernsey Farm

HINSDALE, ILL., OCT. 3, 1924

Owing to the death of Henry L. Stout this herd will be sold at above time and place by the surviving partner, F. D. Stout.

Type --- Breeding --- Production

The greatest lot of cattle offered at public sale this year. Twenty-nine cows in the sale have A. R. records that average 636 lbs. fat and one is over 900 lbs. and three other over 800 lbs. of fat. Many winners at the National Dairy Show including three cows that have won 1st.

Messrs. Stout have bought the best of the breed regardless of price and at that the best things offered are those bred on the farm.

THE HERD CONSISTS OF 85 HEAD and this sale will include the 60 best ones and others will be disposed of at private sale.

Is It Idle Chatter?

The people in Tokio, Japan, are just like the rest of us. When they don't like their telephone service (which is most of the time) they say so and their complaints have resulted in some interesting findings against the women.

The municipal telephone bureau apologized for the poor service and has laid it onto the women, claiming that more than one-fourth of the telephone conversations between them are idle chatter and unnecessary. Of course, they say that men are also sinners in this respect but to an amazingly less degree.

Papers all over the country have copied and commented on these findings, practically all of them agreeing that American conditions, if investigated, would be found to be about the same. They uniformly agree that efficiency of service would rise in proportion as the "idle chatter now being spilled on the wires" was stopped.

I have been on party lines of all sorts varying from two to four subscribers and I will admit that there is something maddening about really needing to use the telephone and being prevented by an aimless conversation that stops only when the baby falls into the rain barrel or when the potatoes begin to burn.

But I do want to say a word in defense of the visiting that is done by women whose work keeps them at home practically all of the time. There are, under such circumstances, days when your spirits just seem to stay at a dead level; you love every member of the family as devotedly as ever but somehow they don't exactly fill the bill. Then some neighbor calls up on the telephone, a good hearty woman whose problems are the same as yours and you visit a while over nothing in particular. It's amazing what a difference it makes. You go back to the dishpan, you hum a little tune, and pretty soon you laugh at yourself because the very same surroundings seem so different to you.

It was just a little talk with nothing in particular to it and yet it was not idle chatter. I would call it perfectly legitimate telephone conversation, but unless you have a private wire I must admonish you not to keep this up more than ten minutes; five is better. That will be about the limit of patience of the man on your line who is waiting to get hold of an extra hand for haying. There is nothing gained by making anyone angry and you'll get as much benefit out of a few minutes' talk as if you stretched it out an hour. More: I know because I have a neighbor who telephones me now and then and I always enjoy it for a time but after I have tried standing up, sitting down, leaning against the wall, doing foot exercises (guaranteed to ward off flat foot), and making out a grocery order on the side, I begin to wish her in Jericho.

Plenty of neighborhood quarrels have started from the telephone. Try putting yourself in the other fellow's place and see how soon you'll have a model line. If it is necessary to prolong things, say so when you hear a receiver taken down. Your courtesy will nearly always be appreciated and returned. If not—well, I have always argued that, if one or the other is inevitable, it is better to be "done" by people than to "do" them.—LUCY THOMPSON.

Sour Cream Recipes

In response to Mrs. W. J. Van Wagoner's request, and since sour cream is most plentiful these summer days, I am sending my list of excellent recipes:

Honey Cookies: 1 cup honey, 1 cup sour cream, 2 eggs, 2 cups rolled oats, 2 cups wheat flour, ½ teaspoon of cloves and cinnamon, 1 teaspoon soda, 1 cup chopped raisins, and ½ cup nut meats. Stir all together and drop by spoonfuls onto greased pan.

Delicious Hermits: 1½ cups brown sugar, ½ cup molasses, ½ cup sour milk, 1 teaspoon of soda, ½ cup sour cream, 2 beaten eggs, 3 cups of flour (or more if needed), 1 cup chopped raisins. Add clove, cinnamon, and nutmeg to suit the taste. Stir all together and drop from a spoon.

Waffles: Beat 2 eggs, add 1 quart flour, and 1 pint sour cream in which has been dissolved 1 teaspoon soda. Fry in waffle irons.

Picnic rolls: Prepare sour cream biscuit dough, cut in rounds about ½ inch thick. Put a spoonful of chopped seasoned meat in center of each, roll together, fry in deep fat, then wrap in oiled paper.

Bran Cookies: ½ cup sugar, ½ cup sour cream, 1 egg, ¾ cup bran, 2 tablespoons milk, ½ teaspoon vanilla. Add flour to make dough stiff enough to handle. Roll, cut out, and bake in moderate oven.

Rocks: 1½ cups sugar, ¾ cup sour cream, 2 eggs, 1 cup sour milk, 2 cups oatmeal, 3 cups flour or enough to make stiff dough, 1 teaspoon soda, ½ teaspoon cinnamon, and ½ cup each of dates, raisins, and nut meats. Mix and drop from a spoon.

These three kinds of cookies should be baked in a moderate oven.

Spider Cake: 1 pint sour cream, ¼ cup shortening, 1 teaspoon soda, ½ teaspoon salt, 1 tablespoon sugar and enough flour to make medium soft dough. Mix lightly, roll quite thin, cut into rounds, and brown on both sides in a hot frying pan. Serve hot with butter and syrup.

Bran Bread: 1 quart bran, 1 pint graham flour, 1¼ cups sour milk, ¾ cup sour cream, 4 tablespoons sugar, 1 teaspoon soda dissolved in little hot water, ½ cup molasses, and ½ cup raisins. Steam until done, then dry off in oven.

Date Gems: 1 cup graham flour, 1 cup white flour, ½ teaspoon salt, 2 teaspoons sugar, 1 heaping teaspoon baking powder, and 1 cup chopped dates. Add a pinch of soda to 1 cup sour cream and stir into the other ingredients. Beat well and bake in gem pans in a quick oven.

New York. LULA A. CAMP.

Homemakers Hints

Lemon pie made with milk surpasses all other kinds. Mix all the ingredients (lemon juice, sugar, flour, a little salt and milk) together cold and cook in the double boiler. If cooked slowly and stirred often it will not curdle.

⚜

During the summer save all the ads and unused catalogs and pack in a box.

They will provide the kiddies with waste paper and cut-outs during the long winter months.

⚜

For real delicious baked beans, flavor wth maple sugar or syrup.

Do not use too much, just enough so they have a slightly sweet taste. If you have no maple on hand, use brown sugar with a dash of maple flavoring.

⚜

Add a handful of raisins to the dried peaches or apricots when cooking them for pies. They will improve the flavor immensely.

⚜

When the children are tired of cocoa try flavoring it with vanilla and they will exclaim, "This cocoa is good! What makes it taste so different?"

⚜

A dainty tinted icing can be made in the following manner: Boil the usual milk icing and let it cool. Then add 1 teaspoon slightly heaping of cocoa and flavor with vanilla. Stir until thick and creamy.

⚜

If you do not care for meringue on the raisin pie, try covering the top with the old-fashioned lattice of one-half inch wide strips of pie crust.

Then the filling will not cook out on the bottom of the oven.

⚜

If the silver has a slightly tinny look after boiling with aluminum ware and soda, give it the once-over with a soft worn out tooth brush and silver polish. it will take only a few minutes and the result will satisfy the most fastidious.

⚜

Grandma Davis says that an optimist is a person who believes that the fence never needs fixing until the cows break through.

New York. (MRS.) G. L. WHITE.

Care of the Coffee Pot

After about so long the coffee pot, like many human beings, seems to need a good going over. When my coffee begins to taste poor in spite of careful making I scrub the pot well, inside and out, rinse it, and fill it with cold water to which I have added a teaspoonful of soda. I bring this to the boiling point and leave it so for about five minutes. Then I wash, scald, and drain it and set it, if possible, in the sun.

One way to insure bad coffee is to leave old coffee grounds standing in the pot. Even if you can't find time to wash it right away it is a good idea to empty and rinse it and let it stand full of cold water until you can get around to attend to it properly.—LUCY THOMPSON.

Had We Better Build an Ark?

My garden is getting almost past hope. Every day I think that I can get out next day and weed it and that night it rains so hard that I almost mire trying to pick the vegetables.

The constant rain has made the mosquitoes so bad that they swarm around me like a flock of vultures

How to Order Patterns

Enclose 10c in stamps or coins (wrap co carefully) for each pattern ordered. Se your order to Fashion Department, Hoar Dairyman, Fort Atkinson, Wis. Every pa tern is seam-allowing and guaranteed to perfectly. Do not fail to state size.

Fashion Magazine

Our Fall and Winter Fashion Magazine co tains about 300 styles, new hot-iron transf designs, illustrated dressmaking lessons, section devoted to styles for children f school, play, and "dress-up" occasions a there are also two pages of pretty Christm gifts that you can make at home. This bo is worth many times its price so we sugg when you send your pattern order that y enclose 10c extra for a copy. Address yo order to Fashion Department.

bent on picking me to the bone every time I try to reap the results of my spring planting.

Every place where I have friends who write me letters conditions seem much the same. I went through a flood once and I've seen many a drought for I used to live in a state famous for them and I have come to believe that too much rain is, on the whole, less discouraging than too little, so I try to take things calmly.

This little verse I found the other day made me think that preparedness might be a good idea, for where would Noah have been without his ark?

Old Noah kep' a-chippin' and a-nailin' and
a-sawin'
And all his wicked neighbors kep' a-laffin'
and a-pshawin'
But Noah never minded 'em, he knowed
what's gwine to happen,
And forty days and forty nights the rain it
kep' a-drappin'.

LUCY THOMPSON.

Shorts

When storing small pieces of cheese wrap it in a cloth that has been wet with vinegar and wrung dry. It will keep the cheese from drying out so much.

Kerosene and a heavy brush will clean galvanized pails and washtubs quickly and perfectly. After they have been cleaned with kerosene wash with soap suds and warm water.

If you have been worrying about getting good brown tops to your pumpkin and squash pies, try this method the next time: separate the yolk from the white of an egg, and beat the yolk in a cup until light, then add one teaspoon of cream or milk, and with this mixture brush over the top of the pie using a soft brush or a piece of cheesecloth. I know a woman who uses this method and she says it gives a shiny brown top like the pies bought in the best shops. I have tried it and was delighted with the method.

To keep left-over pimentos turn the contents of the can into a glass jar, and cover to the depth of half an inch or more with olive oil. In this way they will keep for weeks.—SOPHIA K. ORMOND.

A Few Suggestions

If your white or colored enameled beds become soiled, try cleaning them in warm water in which a few drops of turpentine has been dropped. They clean so easily and the enamel is just as "shiny" as when new.

Use a little camphor on a cloth to clean spectacles and mirrors. It forms a white sediment on glass and when this is removed the glass just sparkles. These are easy to use and the results are marvelous.

West Virginia. (MRS.) L. O. KIDDER.

His Wife's Job

A shiftless specimen of humanity came down town one morning and, joining a group on a corner, announced that he was going to leave town—said he could not live in it any longer. Some one asked him what was the matter.

"Well," he said, "the town is all right; but it's the hardest place in the world for a woman to get work in."—Everybody's Magazine.

The beauty of the house is order,
The blessing of the house is contentment,
The glory of the house is hospitality.
—House Motto.

Friendly Talks For Farm Folks

A farmer who doesn't buy a vacuum freezer and have ice cream every summer day in the year is missing the best dessert to be had and one which is easier to make than any other, as well as being far cheaper than pies and fried cakes. Most farmers' wives will bear me out here—not to speak of the kids in the family.

If the San Paulo mess down in Brazil becomes so acute that Americans can't get their usual cup of morning coffee, perhaps a few millions of them will perforce be obliged to try out milk—and then will naturally never return to the less healthful way.

They can live in their cities in winter—I don't know but I would myself if I had the price—but in the summer the man or woman who doesn't stay on a going farm and there eat his or her head off of field strawberries and fresh asparagus and little green peas and new potatoes and purple raspberries and Astrachan and strawberry apples and ice-cold fresh milk and all the rest, is missing the whole best works of Nature when the latter really sets out to feed a person properly. Yum, Yum! ! There are worser places than the farm around this time 'o year!

Everywhere we go the farmers' wives are bobbing their hair. Personally we are hoping that mustaches and VanDykes for the ladies will never become too popular.

Uncle Ham Burden says that if anything makes him feel meachin, it's to have a stranger refuse to take his check. Especially so when a fellow is ten miles from home with the last dollar bill lost out of his pocket—and the gas tank clean empty.

Although milk-fed children lose their first milk teeth at a tender age, these will be succeeded by practically permanent teeth if the milk was fed copiously and continuously.

Joe Beardley, the hired man, says he's working for the friendliest boss he ever had, as every morning the latter hollers up the stairs at 4 A. M. "Mornin', Joe".

Old Ike Swan thinks these new fangled two-pant suits must be awful inconvenient, changing galusses back and forth.

Now that the Board of Health insists that old Bud Mowers spread his manure instead of leaving it all year under the cow stable window, Bud allows that he'll have to quit farming anyway, as the extra hay he has to cut these days from so much unaccustomed fertility is just the last straw.

Grandma Bascom who is a great reader, can't make up her mind for the life of her whether to cure her rheumatism by having her teeth pulled or take three yeast cakes a day and so become a new woman. As a compromise we suggest a diet of milk.

David Miller often remarks that he would rather grow the prize field of ensilage corn in Crater County than be president of these United States. In our humble opinion David's is a wise choice.

Iowa Celebrates Jubilee Fair

(Continued from page 209)

had been shown thirteen times previous and placed first and junior champion at every event and was awarded grand championship honors nine times. Although there was considerable outside competition, Iowa Guernsey breeders succeeded in taking their share of the prize money.

In the Ayrshire division two animals were shown which, barring accident, will be heard from again. One was the senior yearling, grand champion bull Fairfield Boomerang, owned by Fairfield Farms, Kansas. He is out of Willowmoor Mandy, a cow with a record of above 16,000 lbs. of milk, and sired by Lessnessock Buntie Lad, a good show bull. The other animal was the senior and grand champion female Willowmoor Elsie Ruth owned by Ayrcroft Farm, B. B. Simmons and Sons of Wisconsin. Although carrying a little extra flesh at the time of showing because dry, in working form she should make them all step to keep her company.

With 72 animals entered, the Board of Control was easily the outstanding exhibit among the Holsteins. Few state institutions can boast of bigger and better Holstein exhibits than this. It is notable that the state institutions in Iowa have selected one breed and have developed them to a point where they need not be ashamed of either their show ring appearance or their achievements at the milk pail.

In discussing the dairy cattle show we should not forget that two dairy calf club boys of Iowa were among the exhibitors who won honors. Robert Peterson won a blue ribbon on his junior yearling Holstein bull, and Marple Mountain placed third with a Guernsey heifer amid particularly strong competition in a large class.

A complete list of first prize winners for all breeds follows:

Jerseys

Judge: F. W. Barber, Tennessee.

Bull 4 years or over—Meredith Jersey Farm, Iowa, on Fashionable Fern Lad. Bull 3 years under 4—Campbell Jersey Farm, Iowa, on You'll Do Torono Lad. Bull 2 years under 3—Wardmere Farms, Missouri, on Blonde's Oxford Baron. Senior yearling bull—Waterloo Jersey Farm, Iowa, on Financial Beauty King Mark. Junior yearling bull—Walter E. Wright, Oklahoma, on Xenias Ashley King. Bull, senior calf—Wardmere Farms on May Queen's Noble.

Cow 4 years or over—Inderkill Farms, New York, on Financial May Queen. Cow 3 years under 4—Inderkill Farms on Sybil's Majesty Crocus. Heifer 2 years under 3—Meredith Jersey Farm on Successful Golden Cowslip. Senior yearling heifer—Meredith Jersey Farm on Financial Successful Queen. Junior yearling heifer—Wardmere Farms on Noble Champion Queenie. Heifer, senior calf—Inderkill Farms on Fern's Sociable Sybil.

Senior and grand champion bull—Fashionable Fern Lad. Junior champion bull—Xenias Ashley King.

Senior and grand champion female—Financial May Queen. Junior champion female—Financial Successful Queen.

Graded herd—Meredith Jersey Farm. Yearling herd—Waterloo Jersey Farm. Breeders' calf herd—Waterloo Jersey Farm. Get of sire—Campbell Jersey Farm on get of Combination You'll Do. Produce of cow—Meredith Jersey Farm on produce of Iria's Golden Cowslip.

Guernseys

Judge: C. B. Finley, Iowa.

Bull 4 years or over—Albert L. Hyzer, Wisconsin, on Lassie Boy of the Prairie. Bull 3 years under 4—M. A. Seybold and Sons, Wisconsin, on Navigator's Rival of Maple Heights. Bull 2 years under 3—Mountain Brothers, Iowa, on Kitchener's Cavalier of Iowanola. Senior yearling bull—Mountain Brothers on Betty's Master of Iowanola. Junior yearling bull—W. W. Marsh, Iowa, on Cherub's Prospect of the Prairie. Bull, senior calf—U. A. Woodbury II, Vermont, on Appletree Point Marose Admiration.

Cow 4 years or over—W. W. Marsh on Honey Bloom of the Prairie. Cow 3 years under 4—A. L. Hyzer on Guernseydale Barbi. Heifer 2 years under 3—W. W. Marsh on Golden Queen of the Prairie. Senior yearling heifer—W. W. Marsh on Lilac of the Prairie. Junior yearling heifer—W. W. Marsh on Rose Petal of the Prairie. Senior heifer calf—Mountain Brothers on Maxine's Fig Tree of Iowanola.

Senior and grand champion bull—Lassie Boy of the Prairie. Junior champion bull—Cherub's Prospect of the Prairie. Senior and grand champion female—Honey Bloom of the Prairie.

Graded herd—W. W. Marsh. Yearling herd W. W. Marsh. Breeders' calf herd—Mountain Brothers. Get of sire—W. W. Marsh on get of Cherub's Prince. Produce of cow—W. W. Marsh on produce of Hayse Golden Cherry of Prospect.

Holsteins

Judge: L. S. Gillette, Iowa.

Bull 4 years or over—Board of Control, Iowa, on Cherokee Ormsby Piebe. Bull 3 years under 4—Modern Woodmen of America Sanatorium, Colorado, on Corwin Wimple DeKol Ormsby. Bull 2 years under 3—F. E. Prince, Texas, on Castine Sir Johanna Nig Ormsby. Senior yearling bull—Modern Woodmen of America Sanatorium on Woodcraft Pontiac Champion Star. Junior yearling bull—Robert Peterson, Iowa, on Tritomia Ormsby Veeman. Bull, senior calf—Fred Pieplow, Iowa, on King Piebe Ormsby Cornucopia.

Cow 4 years or over—Modern Woodmen of America on Zwingara Segis Clothilde. Cow 3 years under 4—Marlow and Randall, Minnesota, on Mankato O. K. L. Blanche. Heifer 2 years under 3—Modern Woodmen on Woodcraft Korndyke DeFreule. Senior yearling heifer—Gerald Peterson, Iowa, on Riverdale Ota Van Friesland. Junior yearling heifer—Mudcura Farms, Minnesota, on Oakwood Piebe Allie. Senior heifer calf—Modern Woodmen Sanatorium on Woodcraft Zwingara Julia Pontiac.

Junior and grand champion bull—Woodcraft Pontiac Champion Star. Senior champion bull—Corwin Wimple DeKol Ormsby.

Senior and grand champion female—Zwingara Segis Clothilde. Junior champion female—Oakwood Piebe Allie.

Graded herd—Modern Woodmen Sanatorium. Yearling herd—Board of Control. Breeders' calf herd—Fred Pieplow. Get of sire—John M. Kelley, Wisconsin, on get of Beets Longfield Canary Cornucopia. Produce of cow—John M. Kelley Farms on produce of Alcartra Johanna DeKol Burke 6th.

Brown Swiss

Judge: C. B. Finley, Iowa.

Bull 4 years or over—Mooney and Larrabee, Iowa, on Carl the 6th. Bull 3 years under 4—A. E. Bower and Son, Illinois, on Edgard C. Bull 2 years under 3—A. E. Bower and Son on Elsie Nick A. Senior yearling bull—A. E. Bower and Son on Bonick of Bowerhome. Junior yearling bull—Fred Reuter and Sons, Wisconsin, on Meadow Green College Boy. Bull, senior calf—Mooney and Larrabee on land.

Cow 4 years or over—Mooney and Larrabee on Marie Gronyer. Cow 3 years under 4—Dr. C. F. Osborne, Iowa, on Henrietta Queen. Heifer 2 years under 3—Fred Reuter and Sons on Butternut Valley Schorie. Senior heifer yearling—A. E. Bower and Son on Elsie A. of Bowerhome. Junior yearling heifer—Fred Reuter and Sons on Carl's Ada. Heifer, senior calf—Fred Reuter and Sons on Carl's Lassie.

Senior and grand champion bull—Edgard C. Junior champion bull—Meadow Green College Boy.

Senior and grand champion female—Marie Gronyer. Junior champion female—Elsie A. of Bowerhome.

Graded herd—Mooney and Larrabee. Yearling herd—Fred Reuter and Sons. Breeders' calf herd and get of sire—Mooney and Larrabee on get of Carl 6th. Produce of cow—Fred Reuter and Sons on produce of Teckley's 2nd of Gladmont.

Ayrshires

Judge: L. S. Gillette, Iowa.

Bull 4 years or over—F. H. Baskins, Iowa, on Netherhall Rising Star. Bull 3 years under 4—Ayrcroft Farm, Wisconsin, on Ayrcroft Cavalier. Bull 2 years under 3—F. H. Baskins on Cavalier's Freetrader. Senior yearling bull—Fairfield Farm, Kansas, on Fairfield Boomerang. Junior yearling bull—Ayrcroft Farm on Ayrcroft Cavalier Lord. Bull, senior calf—Ayrcroft Farm on Ayrcroft Red Boy.

Cow 4 years or over—Ayrcroft Farm on Willowmoor Elsie Ruth. Cow 3 years under 4—Ayrcroft Farm on Ayrcroft Ethel. Heifer 2 years under 3—Fairfield Farm on Muirlaught Hilda Douglas. Senior yearling heifer—Ayrcroft Farm on Ayrcroft Snow Lillie. Junior yearling heifer—Ayrcroft Farm on Ayrcroft Roma Nancy. Senior heifer calf—Fairfield Farm on Fairfield Kate.

Junior and grand champion bull—Fairfield Boomerang. Senior champion bull—Ayrcroft Cavalier.

Senior and grand champion female—Willowmoor Elsie Ruth. Junior champion female—Ayrcroft Snow Lillie.

Graded herd, yearling herd, and breeders' calf herd all won by Ayrcroft Farm. Get of sire—Fairfield Farm on get of Lessnessock Buntie Lad. Produce of cow—Fairfield Farm on produce of Willowmoor Mandy.

A RADIO SET for Every Hoard's Dairyman Reader

We know that every Hoard's Dairyman reader is interested in Radio. It is the most fascinating invention of modern times. There's no way of describing the thrill one receives when he tunes in his first station. Just to think that by a turn of the wrist you can pick up at will programs of music, speeches, market reports, conventions, etc., from Boston, or Atlanta or Chicago or Dallas! Just to think that, no matter where you live, the air is full of entertainment and education for any one equipped to pick it up! No more is there such a thing as isolation! No matter how the blizzards rage, no matter how impassable the roads, the home with a Radio Set is always in touch with the world!

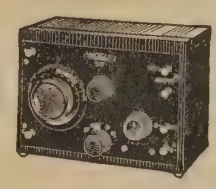
Yes, every Hoard's Dairyman reader WANTS a Radio Set. But wanting one and getting one—in these times—are frequently two very different things.

Here's an opportunity to get a receiving set — as little or as big as you want — without spending one cent of your money. It's an opportunity open to every reader of Hoard's Dairyman who is willing to recommend the "Dairy Gospel" to his neighbors and get them to subscribe.

We have made arrangements with the Crosley Radio Corporation—one of the largest manufacturers in the country, and the Burgess Battery Company that enable us to offer these sets for what we think is a remarkably small number of subscriptions. Just a few hours spent in visiting your neighbors will earn one of the smaller sets—by the way, as far as radio reception is concerned the small sets are just as good as the big ones—and a little extra effort will net you the big 3 R 3 Crosley Tryrdin, the best set Crosley makes.

Start now! We will help you!

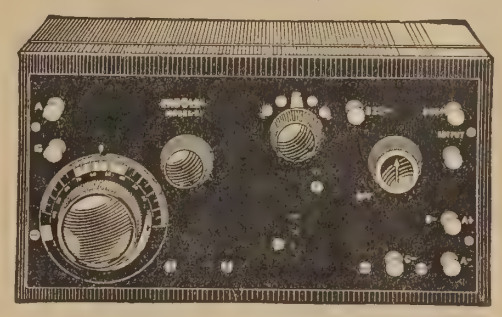
The first thing to do, if you would like one of these sets, is to mail us the coupon below. As soon as we receive it, we will send you



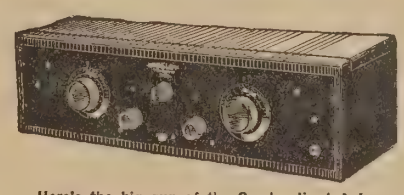
1. A circular describing these sets in detail.
2. Sample copies of HOARD'S DAIRYMAN and a receipt book.
3. A folder telling how to go at it to get subscriptions.

Don't wait! Be the first one on the job! Don't wait to mail the coupon and get started! The first one on the job in your community will find it easiest to get the subscriptions. And the sooner you get started, the sooner you will be able to tune in. And between now and election are the days you don't want to miss having a radio! The air is full of politics. And election night you'll be able to get the returns—AT HOME.

Here's the Coupon! ---send it now



Crosley Type 50



This is a one tube regenerative set—a little peach. It will bring in stations up to 1,000 miles or more good and clear on head phones. Very simple to erect; inexpensive to run, and easy to tune. The writer of this ad has one in his own home, and if he couldn't get another, he wouldn't sell it for $100.00, and it didn't cost anywhere near that!

The Crosley 51

This is a two tube set, which gives a little greater volume on long distance, and will operate a loud speaker on stations up to 500 miles away. The manufacturers claim this to be the most popular radio set in the world.

The Crosley 3R3

Here's the big gun of the Crosley line! A beautiful three tube set; so efficiently hooked up that it gives five tube results from three tubes. It possesses wonderful selectivity; brings in stations from great distances; is very simple to tune, and easy to "log"—which means that once you find a station with the dials set in a certain position, you can always get the same station when you set the dials there. No one needs or could ask for a better set than the 3 R 3.

Take Your Choice --- and send the Coupon NOW!

The first fellow who starts in your neighborhood will be the one who will get his subscriptions easiest and quickest.

POULTRY On The DAIRY FARM

J. B. HAYES

Furniture

Any extreme in equipping a poultry house is possible at the present time. Many lines of manufactured articles are available from which one can select the amount and number desired. These things are made with the idea of being mite proof, easily cleaned and adapted to their purpose. When one can strike a combination of those characters the ideal has almost been attained. Although the prices may seem to be prohibitive, the construction is such that the life of the article is unlimited when given proper care and attention.

From the plans that were submitted in last week's issue, one will notice that the nests are banked along the side wall where they belong. When one places dropping boards in the house it is with the one idea of making the entire floor space available for the flock. When nests are suspended beneath the table, the back part of the house is darkened, it is not available for scratching, the hens become accustomed to nesting there and it puts the nests in the most filthy part of the building. The only reason for placing them in that place is to secure darkness and that is an erroneous idea.

The nests can be banked along either wall in tiers of four or five. This will make a compact battery that is easily accessible both to the hens and the caretaker. A nest 12" x 14" x 14" will allow sufficient space and should easily be dismounted. The top of the lower one should be the floor of the upper and all parts should be hooked together rather than nailed. If seclusion for the hen is desired the entire battery can be moved out from the wall a sufficient distance to allow the hens to enter from the back. A drop front will then allow one to collect the eggs.

When an open nest is used there is a greater likelihood of clean eggs. If one notices dirty litter it will be cleaned but when the interior is darkened it will develop into a game of chance. Another important point in promoting clean eggs results from placing the nests in the opposite end of the building from which the flock enters. During rainy weather, walking across clean litter will remove a great deal of mud from the hen's feet.

Above the nests one can place the broody coop. Wire sides and top may be used but the floor should be of slats. Wire tends to cause sore feet while the slats prevent this and yet allows the droppings to fall through to the pan below. A suitable broody coop is just about as necessary as the dry mash hopper.

The construction of this house will allow the water pan stand to be placed in the center of the house even if a center support post is not deemed necessary. This, too, should be elevated two and one-half feet from the floor to prevent dampness in the litter and allow that portion of the floor for the flock.

If a pail is used as the watering device, a hole can be cut in the center of the platform in which the pail can be more firmly set. Even a large open pan will prove satisfactory. Freezing will result during the winter but if the water is given to the flock while hot, it will remain for some time and will only need regular replacing.

Mash hoppers are always a problem for the operation of them is always dependent upon the construction of the mixture that is used. If the mash contains too much bulk the hopper will clog while a very finely ground feed will be wasted. The basic principles of all the hoppers are about the same and changes in the feeding trough will generally remedy other defects.

It is almost impossible to properly manage a flock without dry mash so some personal attention to the construction of the feeder is needed. The most common defect is a lack of sufficient hopper space to allow the entire flock abundant supply. On this account a two-way feeder that will permit the hens to work from each side is preferable to a one-sided wall hopper.

The trough feeder that is elevated from the floor on a platform with a revolving cylinder above it to prevent roosting and a board set in from the front about two inches wide and at a 45 degree angle, will prove satisfactory. This can be criticized on the basis of not holding any great supply of feed and needs constant replenishing. That is true, but one can about as easily put mash from a wall bin into the hopper as to push the feed down when it clogs in the other style.

A dropping board is required. An elevation of two and a half to three feet from the floor is sufficient to permit light to penetrate the rear of the house. The platform of matched boards allows easier cleaning and gives a more substantial construction. Hinging at the rear allows them to be raised during the day and removed from the house in summer if field work will not permit of regular cleaning.

Eight inches from the dropping board is about the proper height for the roosts with a fourteen inch space between them. Regular 2 x 4s that are placed on end and have the upper edges bevelled off are very satisfactory. Cross arms that are hinged to the rear wall will serve as supports and the roosts should be countersunk into this support and not nailed. Freedom from mites is more certain in this way.

In estimating roosting space one should allow six to eight inches per fowl. Overcrowding can often seriously affect the condition of the birds as well as the production. It is understood that the roosts and dropping boards are level and not set at an angle.

Animal Protein Helps Hens Fill Egg Basket

That animal protein is required for profitable egg production is clearly shown by a test just completed at the Ohio Experiment Station. The figures for the nine weeks of the experiment show 583, 245, 190, and 369 as the number of eggs laid by lots 1, 2, 3, and 4, respectively, of 28 White Leghorn hens each.

This wide difference was due to the meat scrap ration, it is claimed, as all received the same care and were equally good layers naturally as proved by the previous month's record of 305, 345, 390, and 334 eggs, when all lots received the balanced ration of grain and mash containing 20 per cent meat scraps. During that month a light feed of grain was given in the morning and all they would eat in the evening, and the mash was kept before the hens all the time.

During the experiment, Lot 1 was continued on this balanced ration. Lot 2 was given all the grain the hens would eat, but no mash. Lot 3 was continued the same as Lot 1 except the meat scrap was omitted from the mash. Lot 4 received the same as Lot 2 during the first 5 weeks; then the mash with meat scrap was returned, making the same ration for the last 4 weeks as Lot 1.—Press Bulletin, Ohio Experiment Station.

New Life for Light Plants

Replace your worn battery with a UNIVERSAL. There's one to fit *every* make of plant—Delco, Alamo, Genco, Lalley, etc. We make a generous allowance for your old battery.

Sealed Glass Cell

UNIVERSAL "Nu-Seal" cells come to you *fully charged*. Nothing to do but hook up—it's easy and they are ready for a long life of work.

No Cleaning, Ever

Ample space below the plates holds all the sediment till battery is worn out.

There's a UNIVERSAL Battery made for every job requiring a storage battery—Automobiles, Tractors, Radio, Farm Light and Power Plants.

They have proven their dependability in over 20 years of service. UNIVERSAL Hard Plates is only *one* reason for their remarkably long, trouble-free life.

A Rechargeable "B" Battery

A new UNIVERSAL "B" Battery for Radio! Now you can be assured of *constant* clear reception, steady voltage, a stronger, more even flow of current. No losing of stations—no fading reception. A full line of "A" Radio Batteries also. Write for catalogs.

FREE BOOKS

on Radio

Write today for your copy of our 16-page instruction booklet on care of "A" and "B" Radio Batteries. The only book of its kind ever published.

on Farm Light

An interesting book, telling how to get best results from your farm light batteries. Every farm light plant owner needs it. It's free. Just ask for it! [733]

UNIVERSAL BATTERY CO.
3406 So. La Salle St., Chicago, Ill.

He takes his pipe 1800 miles into China

And for a very good reason

No, it isn't because his wife objects to his smoking in the house. We don't know that he has a wife, for that matter.

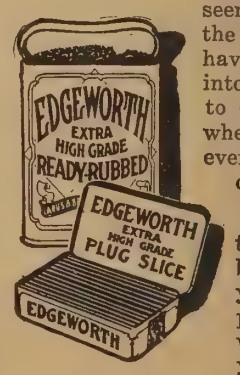
Mr. Mellor takes his pipe far into the interior of the Land of Confucius because he is attached to the good U. S. S. Palos, which, among other waters, sails the upper Yangtse Kiang.

This is what Mr. Mellor writes:

U. S. S. Palos
Chung King, China
January 24, 1924

Larus & Bro. Co., Richmond, Va.
G. C. Schloss,
Dear Sir:

"I have just been reading a letter that was sent to our canteen yeoman and thought that this would be a good time to tell you of our appreciation of the fine tobacco that your firm shipped us. I feel that I can say the same for the crew of this ship.



Yes, this sure is an out-of-the-way place and we sure enjoy a good smoke. We feel that we can at least rely on your tobacco always being fresh, especially that in the glass jars.

This ship is now eighteen hundred miles in the interior of China on the upper Yangtse Kiang. One of the greatest pleasures we have is riding ponies out in the hills surrounding Chung King; and there is hardly a man but what carries one of your small tins of tobacco with him on these trips. Every man on the ship smokes Edgeworth and quite a few chew it too.

Another thing that I might mention is that the empty jars make good containers for shaving gear and soap on board ship.

Speaking for all hands and the ship's cook I can say that we will uphold your fine tobacco on this part of the river as every man is for Edgeworth first, last and always. Best regards to Edgeworth from the crew of the U. S. S. Palos on the Yangtse River.

Sincerely yours,
(signed) Robert N. Mellor

This makes it seem pretty soft for the members who have only to drop into a corner store to get Edgeworth whenever and wherever they may run out.

If you would try before you buy, let us send you free samples of Edgeworth and give you a chance to learn at first hand why so many smokers like it.

Write your name and address to Larus & Brother Company, 57 South 21st Street, Richmond, Va.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

We'll be grateful for the name and address of your tobacco dealer, too, if you care to add them.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Ready-Rubbed for the same price you would pay the jobber.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Diagnosis of Disease

Before giving a sick animal any sort of treatment it is of the utmost importance to determine correctly the seat of the ailment, its nature, and, when possible, its cause. Unless such a determination is made many an error in treatment will occur. A drug wrongly chosen or administered may do much more harm than good. In some instances it will prevent recovery that otherwise would have taken place, for Nature if not interferred with often restores an animal to health and man's chief aim, in perhaps a majority of attacks of disease, should be to assist Nature in every possible way. Fortunately animals often recover despite the erroneous treatment given them, while in other cases the medicine administered is harmless and therefore does not hinder recovery. In all cases it is far better not to give any medicine than the wrong one and before dosing the animal one should therefore study the symptoms that a correct diagnosis may be made.

That symptoms may be correctly interpreted it is necessary for the observer to have studied many animals in health that he may quickly and rightly recognize departures from the natural actions and functions when sickness occurs. To that end let every owner and attendant become practically acquainted with each of his animals in health and make himself conversant with the habits and actions of all farm animals. No man has to be more observant than the farmer if he is to succeed in his business and the earlier a farm boy learns to like animals and note their behavior and peculiarities, the better will he be fitted for his life's work in giving them intelligent care and treatment. Even the "voice" of every farm animal conveys impressions to the trained observer. It is capable of many different expressions and this language of live stock every breeder and feeder should understand. Just an example or two may be cited in evidence. A dog attacked by rabies has a changed voice. It has a half-bark, half-howl call and that should warn the hearer. There are several variations in the calls of cattle and of horses and each has its particular significance. The boy or man who becomes acute in recognizing their meaning will also be sure to note the condition of an animal's skin and hair, its various attitudes when at rest or in motion, the way in which it anticipates feeding and then consumes its feed. Each animal in a row of dairy cows may also show slight differences in its actions, appetite, and manner of eating. Knowing these the attendant at once notices the slightest change as it occurs and instantly tries to determine the cause. Early detective work of this sort often means prevention of serious disease. The amount or quality of feed at once is altered or modified and often feed has to be withheld until the animal can care for it in a normal way.

In this connection the attendant should likewise become a correct and experienced reader of the signs offered for inspection by the amount, consistency, color, and condition of the feces of each animal in his charge. Knowing the normal appearances of "manure" the attendant passing behind each animal the first thing each morning will at once notice divergencies from the natural state and arrive at useful conclusions relative to changes that should be made in the ration.

Some of the hints given by the appearance of feces are: Scant, dry, hard, glistening droppings indicating constipation; pale, clay-like feces, often slimy, indicating torpidity or derangement of the liver; mucus covered feces or long strings of mucus indicating fever or a dangerous form of irritation or inflammation of the bowels; diarrhea indicative of severe irritation of the lining membrane of the intestines and of many sorts, ranging from simple scours to dysentery of several types; suppression of feces, indicating impaction; blood in the feces usually characteristic of malignant disease, such as anthrax or hemorrhagic septicemia, and many other departures from the normal that will help the keen observer to make a correct diagnosis. At the same time the urine is as carefully noticed and when these things have been studied the thermometer will be used, the pulse taken, and the respirations counted.

In time, by patient, close, correct study, every attendant upon animals may become expert in recognizing the symptoms of disease and will therefore become capable of giving first aid treatment and can help the attending veterinarian greatly by giving him a correct history of the case he is asked to treat.

Obstructed Teat

I would like to get a little advice concerning the treatment of a cow with a defective teat.

About a month ago the end of front teat on right side seemed obstructed on the lower end. The rest of the teat has always been normal.

I have used a milking tube to draw milk and kept a teat plug inserted between milkings. At times I can milk by hand but milk comes in a spray instead of a stream, in dicating some obstruction.

I wish to dry this cow off prior to calving or within the next two weeks but hesitate, owing to belief opening will heal shut altogether and render this quarter useless when she freshens.

Whittlesey, Wis. G. S.

We think it likely that if you squeeze the tip of the teat a warty growth will protrude. If there is no growth a stricture or thickening and hardening of the lining membrane of the duct of the teat is the probable cause of the spraying of milk. If a growth is there the veterinarian may be able to cut it out or burn it out with a caustic, but we cannot advise you to attempt such treatment. If there is no growth slitting down through the teat stricture in four different directions with a sterilized teat bistoury would be the proper treatment as use of dialators has failed. After the veterinarian operates, strip away a little milk at frequent intervals to keep the duct open and be careful to disinfect the teat now and then by immersing it for a few minutes in hot water containing all the boric acid it will dissolve.

Diseased Cows

I bought a number of cows last fall that had something in their throats. They coughed quite badly. Also bought some later and they also caught it.

Glen Ellyn, Illinois. H. V.

Tuberculosis probably causes the symptoms described. The disease is incurable and contagious and makes the milk dangerous for use by man or animals. To determine the matter you should at once have a qualified veterinarian apply the tuberculin test. Reacting cows will have to be disposed of in the manner prescribed by law which the veterinarian will explain.

We Have Revised and Improved Our

VEST POCKET HERD BOOK

The new editions contain numbered and lined pages; and have room for more records and services. We sold hundreds of these leather bound books last year and feel confident that with the small improvements the book will be even more popular. Book will accommodate herd of one hundred head. Complete with pages for full services, gestation tables, index, etc.

Ever Failing or Never Failing Pastures

(Continued from page 205)

clover the first fall puts it back a good 10 days the next spring."

Seed One and One-half Acres Per Cow

Because sweet clover is the finest soil builder in the world and needed on almost all soils for their own good, one and a half acres of sweet clover per cow should be seeded in the small grain. With this double acreage which the cows can not keep down so close, they may be turned on earlier in the fall and thus prevent a gap that sometimes occurs between the end of the summer pasture and the time the new clover in the stubble can be turned onto. With the larger pasture, the sweet clover will take care of itself and go into winter with the proper development.

Professor H. J. Snider of the University of Illinois, has dug sweet clover roots at all stages of the plant's growth and finds that, in most soils, when the tops are a foot high the roots go down three feet deep.

If we once get a large, deep root system developed on sweet clover plants, the cows can not eat this up, and this large root system is what keeps the plants growing so vigorously the second year, even through dry weather. It is what the farmers say gives lots of "pep" to their sweet clover pastures.

I had a neighbor who started to grow sweet clover for pasture. He turned his cows onto the stubble as soon as the last bundle of grain was out of the field. The clover was not more than eight inches high, and his large herd soon ate it down to the ground and kept it eaten close the remainder of the summer. The inevitable result was that he got a small amount of feed per acre and was disgusted with the crop.

Pasturing Sweet Clover the First Summer

Through lack of forethought or otherwise, dairymen sometimes find themselves without pasture in the spring and want to sow some crop that will afford pasture almost immediately. At best this is a hard situation, but sweet clover does fairly well, used in this manner. It should not be turned onto until the latter part of June, hence two months of good pasture are lost as compared with the system advocated in this series.

Plowing Up Sweet Clover

Sweet clover is a biennial; it does not die at the end of the first year, and it can not live longer than two years. Plowing it under the first fall will not kill it and this practice has led to all the trouble from sweet clover coming up in the following crop. If the ground is to be put into corn, the clover should not be plowed until after it has made some growth the following spring—the more the better. This will help kill it. If the sweet clover in the oats stubble is plowed up in September and the ground sown to winter wheat or rye, the clover will naturally make a great deal of trouble in that crop, as a number of farmers have found. But the sweet clover may be plowed under the second fall, as its life is ended.

Sweet Clover Pasture Fits into the Rotation

On a farm where all of the land is tillable, an excellent rotation is corn, corn, small grain (seeded with sweet clover), and sweet clover pasture. If it is desirous to raise less corn, a three-year-rotation of corn, small grain, and sweet clover pasture may work out better. Even on farms that have only a few dairy cows, a rotation of this kind is carried on in small fields near the house with marked success, and if hogs are raised, the corn may be hogged down in the fall.

Just Like Us

As a rule
Man's a fool;
When it's hot
He wants it cool;
When it's cool
He wants it hot,
Always wanting
What is not,
Never pleased
With what he's got.

BROWN SWISS

ANNOUNCEMENT

KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

CRANE AUTOMATIC WATER SYSTEM

CRANE AUTOMATIC WATER SYSTEMS CAN BE HAD IN CAPACITIES RANGING FROM 200 GALLONS UP TO 6,000 GALLONS PER HOUR

FOR THE HOUSE, TWO TYPES FOR THE ORDINARY AND DEEP WELL ELECTRIC OR GASOLINE POWER. A THIRD TYPE FOR LARGE USERS

Why work for your water supply? Make it work for you instead
enjoy finer health and comfort, yet save time and money

What is more important in your home and on your farm than water? Yet, is your supply uncertain? Do you have to spare it to make it last? Or pump it by hand?

Why put up with such inconvenience any longer? A Crane Automatic Water System will give you fresh running water every day of the year—in bath, kitchen and laundry; in barn or barn yard—everywhere. Just turn a faucet. Water pours out at full pressure as surely and promptly as from a city system.

Costs less to own than to do without

Your time is money. A Crane System saves enough time to pay its cost. It adds more than its price to the value of your property. A few cents a day pays for gasoline or electric power. Your bath becomes a pleasure. Chores are lightened. Wash-day burdens are lifted. Living conditions become finer, more healthful for your whole family.

A trouble-proof system for every need

There is a Crane System for the home alone, entire farm or large estate. Capacities from 200 to 6,000 gallons an hour. Water may be pumped from an open or driven well, from cistern, lake or spring to pressure or elevated tank.

Crane pumps run quietly and smoothly. Special design prevents oil from mixing with the water. Flood lubrication. The crankshaft bearings are fitted to .0005 of an inch. Valves are easy to get at and are interchangeable. Visible oil gauge. The Crane name guarantees dependable service the whole year 'round.

Eliminate expense and inconvenience. Make this finer health and comfort a reality in your home and on your farm.

Investigate the first time in town

Look up the plumbing contractor or dealer in your town who handles Crane plumbing materials. He will help you select the right system and fittings. Mail coupon now for new water system booklet, HD-1 and "analysis sheet," enabling us to determine your needs.

CRANE

GENERAL OFFICES: CRANE BUILDING, 836 SOUTH MICHIGAN AVENUE, CHICAGO

Wherever you live, there is a plumbing contractor or hardware dealer near you who handles Crane products. He has the Crane water system that fits your needs or he can immediately secure it from the nearest of 87 Crane branches in the United States. Should you have any difficulty in securing the right water system, write to us at Chicago.

CONTENTMENT ON THE FARM

CHARLES B. WING, OHIO

LIFE is very largely what we make it. The old saying, "Opportunity knocks but once" is untrue in every detail. Man makes his own opportunites and as many and as great ones as he has capacity. After he has made them he either succeeds or fails in carrying them out according to his own ability. Life is not only what we make of it but unfortunately what we think of it. That is why, when our viewpoint becomes deranged, the world which God made in all its beauty, looks all wrong to us.

What does life give to man? Food and drink, warmth and rest: food for body, mind, and soul; warmth from the sun and from fuel that we burn; rest for body, mind, and nerves. It is because we who live in the country are especially favored along all these lines that we are and ought to be fairly contented and happy.

Let us analyze these statements more fully. I go to the cities at times and I know from observation that food means little to the city man. That is because he is so unfortunate as to be confined nearly all of his time within four walls, deprived of the oxygen that gives life to all things. He eats because he must, but the advantage is all with the country man, who really enjoys what he has.

"WHERE THE COW IS, THERE IS ARCADIA; SO FAR AS HER INFLUENCE PREVAILS, THERE IS CONTENTMENT, HUMILITY, AND SWEET, HOMELY LIFE."—BURROUGHS

Food for the mind then. The advantage of great libraries is with the city man, but I go into them and find them serving an extremely small clientele, maybe one man out of a hundred of those who are within easy reach. The things that they actually read carefully are the same daily papers and magazines that come largely to our own doors.

Food for soul? Here the city man is to be pitied and we have all the advantage. True he can drive down the boulevard with a hundred other cars all in line and in each other's way. He can go to the park, and the cities have some very wonderful ones, but the parks are not at all equal to our miles of country.

I look out upon the first of May. Shrubs and trees are putting on their summer clothes, their tender foliage ranging from gray green through fawn and soft brown into dull red, the earth below fast doning its vivid green, a patch of tulips adding just the touch needed to complete the work, and I say, "Surely here is food in greatest abundance, food for all of our souls." Again a few weeks later, where the orchards are in bloom, the very birds exulting over it all, the world is a fairyland. Again I look in July. The trees have all their foliage now and cool, inviting shade is under their great branches. The earth shimmers and radiates waves of energy. Butterflies calmly sail here and there, marvels of beauty and of grace. Wild flowers bloom everywhere, the touch of breeze is like a caress, and the bird songs complete a world that invites the study and infinite enjoyment from every one of our senses. Certainly here is food for both brain and soul. Autumn comes, roadside and fence rows are lined with asters, golden rod, and brown-eyed susans. The birds are contentedly journeying southward, their season's work, as ours, completed. They have raised a family and have cheered and encouraged every one that listened to their songs while they worked or played. The wood or forest tree or orchard is ripening, the buds for next season's growth forming, and when frost comes every tree and shrub blazes forth in its autumn colors. Not like anything sinister is this? Their leaves say "Goodbye, we have had a lovely time all summer. We have helped to feed and clothe our parents, we have sheltered the birds from storm and man from the heat of summer. Rain has fallen in its season partly by our influence. Now we are going and we bid you a most joyful farewell."

Winter comes with its new exhilaration, its fresh air from northern climes free of disease. It braces like iron and both body and mind are refreshened and renewed in strength and activity. This also is food for body, mind, and soul.

My friends, there is no comparison. All the advantage is with us who live in the country. Advantage not for making money, but for the development of all that is really best in life, strength, and health of body and mind, and the very training of the soul.

What else is in life?

We mentioned warmth. In winter the city man has no advantage, and in summer he wears a coat against which every fibre in his body must protest.

Rest? Here again there is no comparison. Cities are feverish where there is no night. Men are restless. It is in the country where man follows the cows, that rest for body, mind, and nerves really comes. Do not city men worn in nerve and mind, nearly always come to the country to rest? Maybe its fishing or camping, but it is always to the country, to nature, that these men come. Both instinct and the doctor's advice send them there.

"But," you say, "I haven't the money to make my place really attractive. I haven't time to mow the lawn, only a little of it that the children do. I would like to have a row of fine trees along the driveway and one clear along the pike. I'd like to have all new, straight wire fences, with paint for the barn every three years. I don't know much about flowers, but these rich city men would no doubt make this farm look fine by planting unusual trees, shrubs, or flowers in fence rows along the pike or around the buildings. I can't do these things for lack of money."

Here is where we do not agree. I know of a wealthy city man who planted a Crimson Rambler rose in each rod of his fence along the road. When I told my friend, Hottes, a landscape architect, about this he blew up and called it sacrilege. "If you want things beautiful make them as natural as possible. Don't introduce things that are out of place, such as shrubs and trees that belong in a different climate. One or two Crimson Ramblers for this man would have been all right, but one in each rod sets my teeth on edge. When you plant trees never set them in a straight line, follow nature's laws and make them look as if they just grew there. Nature plants nothing in straight lines, she uses curves and irregular formations always."

I have given this matter some thought and am sure that Hottes is right. I would sooner have all wild roses along the fence than a Crimson Rambler to each rod. I am partial to the trees and shrubs that grow naturally all around me, although I have no objection to introducing a few rare or beautiful things from a distance in order to diversify and richen

(Continued on page 284)

Co-operative Denmark

As Seen by Alfred Miller, a Former Wisconsin Cow Tester

TO give American readers an idea of the extent of the co-operative power in Denmark, it is necessary first to look over the geography and study the climatic conditions of the country. While it largely is a country of small farms of 10 to 15 acres, with fields like garden patches, all farms are not small. There are a large number of farms with 50 to 100 acres, and some with from 400 to 600 acres. The middle-size farms are considered the most profitable because of the low cost and better supervision of labor. Farm labor is cheap and a good man is only getting about $200 a year with board and room.

The map of Denmark shows one peninsula and 150 smaller or larger islands, many of which are too small to show on a smaller map. All this land together measures 15,000 square English miles. This does not include the Farol Islands, Iceland, or Greenland. These colonies of Denmark have an enormous big area, but surprisingly big areas of them are useless.

The surface of Denmark is gently rolling and on but one island does granite show, but limestone ledges are common in the eastern part of the country. It is a lowland and has a coast climate, the altitude varying from sea level to 560 feet, with half of the country having an altitude of less than 100 feet above sea level. The rainfall is about 8 inches on an average. The population is 2,757,000, with nearly one-half of this number as farm population.

The beginning of the Danish co-operation took place during the hard times following the war of 1864 with Germany and the loss of one of her best provinces. Agriculture at that time was confined largely to the single crop system and small grain was the main product. About this time the doors were thrown open to the granaries of Argentine, United States, Canada, India, and Australia. This flooded Europe with cheap grain, grown on cheap, fertile land. With no tariff on the imports, the farmers found it impossible to raise grain on their starved land for the price foreign grains were offered. The Danish agricultural economists pointed to the dairy cow as the savior and farmers began to keep more cows. They found it profitable to feed the cheap grains from foreign countries to cows and other stock. With more cows came the idea of co-operative creameries as up to that time butter had been made on the farms and sold in stores. The surplus was exported to Germany and England but this butter was of a very mixed quality.

The co-operation grew from its crude beginning to an enormous movement. Indeed, so large has it grown that some of the Danes fear it has grown too large. However, it is the strongest united power of the country. In order to get an idea of its extent I name below the thirty-seven different branches of agricultural co-operation, all of which work in harmony and under a union leadership:

Cement Factory, Stores, Creameries, Creameries' Federation, Milk Grading Association, Creameries' Trade Mark Association, Packing Plants, Packing Plants Federation, Egg Export Association, Butter Export Association, Danish Bacon Co., (London) Live Stock Breeders' Association, Horse Breeders' Association, Swine Breeders' Association, Sheep Breeders' Association, Goat Breeders' Association, Cow Testing Associations, Buying Associations, Sanitary Associations, Workers' Housing Associations, Selling Associations, Credit Associations, The Farmers' 2nd Mortgage Exchange Bank, Co-operative Bank, Savings Bank and Advance Association, Live Stock Insurance Associations, Hail Insurance Associations, Storm Insurance Associations, Fire Insurance Associations, Accident Insurance Association, Life Insurance Associations, Co-operatively Owned Farm Machinery, Electric Power Plants, Marl Associations, Bakeries, Fruit Growers' Associations, Co-operative Associations' Federation.

The efforts and success of these organizations vary a good deal, but facts are that they exist and many of them have cornered their respective business.

The Danish farm buildings as a whole are quite simple and old looking. Most of them have the well known rye straw roofing and many have the old binding timbers in the masonwork. Most of the machinery is crude and simple, except on the larger farms where they have modern harvesting and threshing machinery. On the small farms the threshing is still done by hand with a flail. On the medium sized farms it is done by a small horse power threshing machine that will take only a good handful at the time and shake the kernels from the straw, the grain being then put through a hand power fanning mill. The threshing is all done during the winter when the work is slack on the farm.

Largest attention is given root crops and an enormous acreage is seeded down each year. It takes considerable labor to raise and harvest such a crop, but as corn can not be grown, this is their only winter feed for the dairy herds.

TYPICAL FARM BUILDINGS ON A DANISH FARM OF ABOUT 50 ACRES

SEEDING IS CONSIDERED A PARTICULAR OPERATION AND TWO MEN ARE NEEDED TO RUN THIS SEEDER

Note the particular type of hitch without a pole and that the horses are equipped with breast collars.

Specialization—Does It Pay?

W. H. WILLIAMSON, MICHIGAN

A PRODUCER should have some idea as to what extent he expects to specialize in the different branches of farming. This opinion of what he intends to do should be formed from the results of his past experience or else from the findings of other people.

As dairying is one of the most important branches of mixed farming, let us consider to what extent it will pay to specialize in this industry. The conditions on different farms do not allow for any rigid rule to be followed, but every farmer is thrown on his own responsibility to decide what conditions are most favorable for him. It should, however, be interesting to consider the findings of surveys on this subject.

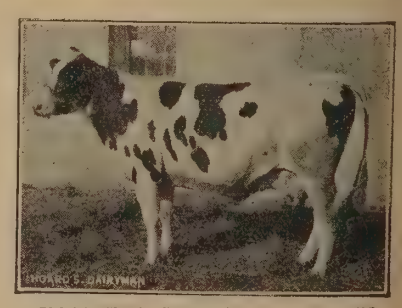
The Department of Economics of the Ontario Agricultural College, in making a survey in one of the dairy counties, endeavored to find to what extent it paid a farmer to count on the sale of his dairy products as a means of obtaining his farm income.

The results of this survey are as follows:

Percentage of Total Farm Receipts From Dairy Herd

% total farm r'cpts. from dairy herd	No. of farms	Labor income	Milk sold per cow	Labor hired per farm	Feed bought per farm
Below 51	43	$861	$79	$408	$217
51—60	55	1384	99	445	269
61—70	65	1485	108	465	274
71—80	79	1285	117	395	276
81—90	47	1335	124	442	233
91—100	38	986	134	409	304

The above table very clearly shows the comparative results of different degrees of specialization. The first group of forty-three farms received less than half of their gross income from the dairy herd. This income was received from the sale of milk and young stock. This group might be classed as mixed farmers rather than dairymen.



It will be noticed that the labor income increases until about seventy per cent of the revenue is obtained from dairy products. When more than seventy per cent of the income is from dairy products, the profits have a tendency to remain the same or become lower until after ninety per cent of the income is from the dairy when the profits take a decided drop. The group of strict specialists made almost as low an income as the group of mixed farmers.

There are some very successful dairymen who specialize to a much higher degree than seventy per cent and do it extremely successfully. These men are born dairy specialists. The twenty farms with the highest labor incomes were picked from the last two groups in the table. These farms had over eighty per cent specialization. A partial analysis of their business is as follows:

Number of farms, 20; average degree of specialization, 88 per cent; labor income, $2,596; milk sold per cow, $145; labor hired per farm, $606; feed bought per farm, $450; herd average milk, 6,100 pounds; number of cows per 100 acres, 18.

That the operators of these farms were successful is proven beyond all doubt. The labor incomes averaged $2,596. They secured from their cows an average milk yield of 6,100 pounds, which they sold for $145. They are heavily stocked, having 18 milch cows to the 100 acres, besides the young stock necessary to maintain their herds. But these men, though successful specialists, did not eliminate all side lines. They specialized up to 88 per cent of their total business, but 12 per cent of their revenue came from sources other than the dairy herd, cash crops, hogs, colts, poultry, etc. In dairying as in any other business, specialization offers opportunity for great success, but at the same time offers as great opportunity for unqualified failure. There were eighty-five farms in the two groups over 80 per cent specialization, having an average labor income of $1,186. Twenty of these farms averaged $25.96 of labor income. Consequently there must have been as many with low labor incomes to bring the average down to $1,186. The dairyman must decide for himself, therefore, whether his own natural ability will allow him to enter the realm of the specialist, with its opportunities and at the same time its hazards, or whether he is better off on the surer footing of average ground, where his chances of great success are fewer but where he is sure of being at least fairly comfortable.

The tables show two things conclusively. First, that the average man must receive at least half of his gross income from the dairy herd. Second, he must not go to the other extreme and neglect all side lines. The group of strict specialists made almost as low an average labor income as did the group of mixed farmers. And in consideration of the fact that the 61-70 per cent specialization group made $150 more labor income than any other group of higher specialization, it may be said that this is the safest and best organization for the average man.

HOLSTEIN COW, JANE GERBEN LYONS

Nebraska's new champion cow over all breeds for one year's production of both milk and butter as a junior three-year-old is Jane Gerben Lyons, owned by the Nebraska School of Agriculture. In 365 consecutive days she produced 21,522.7 pounds milk and 717.41 pounds butterfat, equal to 896.7 pounds butter, according to the Advanced Registry Department of The Holstein-Friesian Association of America.—Extension Service Holstein-Friesian Ass'n. of America.

EVER FAILING OR NEVER FAILING PASTURE

Part 12.

Supplementing Bluegrass Pasture With Sweet Clover

WILBER J. FRASER, University of Illinois

At least three-fourths of the bluegrass pasture on our millions and millions of acres of untillable land could be reinforced with sweet clover by discing the seed into it, and thus double the production of feed from this same land.

As shown by the four years' pasture demonstration at the University of Illinois and in common farm experience, bluegrass pasture lies largely dormant during midsummer. In the face of such a disadvantage, this series does not recommend bluegrass at all except on land that can not be tilled. It must be remembered, however, that this is a tremendous area, as one-sixth of the farm land in the nine chief dairy states is untillable. This amounts to over one and one-half times all the farm land in New York or Wisconsin. So with the bluegrass one must of necessity have, the gigantic problem is to supplement it. It is far better to grow a small area of sweet clover for this purpose than it is to go to all the laborious work of raising and feeding corn silage, hay, and grain.

Half Acre of Sweet Clover Per Cow

Usually one-half acre of sweet clover pasture per cow will be sufficient to supplement the bluegrass. This will permit the cows to be turned out two or three weeks earlier in spring than they should be on bluegrass. At this rate of pasturing, the sweet clover will be eaten down short by about May 15 for Northern Illinois, and the cattle should then be put onto the bluegrass for three or four weeks. This change will give the clover time to make a good growth so that it will stand heavy pasturing again when the bluegrass commences to fail. It will then carry the cows over midsummer until the new seeding of sweet clover in the stubble is ready for them. Throughout the season the stock can be moved from one pasture to the other, according to the relative growth of each.

Mr. Pittinger of Southern Illinois was entirely out of feed April 15 and turned 15 cows onto six acres of sweet clover, then about six inches

Sweet clover a foot high in W. D. Howland's permanent bluegrass pasture, July 25, 1924. The seed was disced into the bluegrass early in the spring the year before.

high. In three weeks they had it eaten close to the ground. He then changed them to bluegrass pasture. When the field was inspected by the writer, May 29, the sweet clover had grown up nearly two feet high and was ready for midsummer pasturing during the time of the failure of the bluegrass.

Sweet Clover in the Bluegrass

Another and far better way to use sweet clover in supplementing bluegrass on untillable land is to seed it right into the bluegrass. It has been found that the production of the pasture can be greatly increased by this method.

Maes Brothers of Southern Illinois have had seven years of marked success in seeding and maintaining sweet clover in permanent bluegrass pasture. They had 28 acres of rough pasture that could not be killed. To increase the yield of this pasture, they seeded a part of it to sweet clover, 12 lbs. to the acre early in the spring. They first applied four tons of limestone per acre and disced the ground four times, after which the seed was harrowed in.

This clover was allowed to get a good start before the stock was turned on the first spring. It has reseeded itself every year since, while being pastured, and the area which was seeded seven years ago is still covered with about one-half a stand of sweet clover. The stock had been

SEEDED THREE YEARS AGO

SEEDED SEVEN YEARS AGO

Maes Brothers' permanent bluegrass pasture which had been limed, disced, and seeded to sweet clover. Note the excellent growth and rough, hilly land.

on it for five days, when I visited the farm May 27, and the clover stood two feet high. Maes Brothers sow sweet clover in all of their small grain and so by pasturing this in early spring and late fall are able to permit their bluegrass pasture to get a good start before being turned onto in the spring and before going into the winter.

Another part of the pasture was seeded to sweet clover three years ago, following the same method; however, the seeding was done this time late in August. This clover also reseeded itself and showed an almost perfect stand.

Supports Twice the Stock

Formerly the 20 acres of bluegrass furnished feed for 10 cows for five to six weeks in the spring. In striking contrast to this, with less than half the 20 acres growing sweet clover in the bluegrass, this same land now supports 20 cows or cow equivalents for two and a half months during the dry weather of midsummer, or until the new sweet clover in the grain stubble is ready to turn onto. Since sweet clover has been put into this bluegrass, the same land carries twice the amount of stock and furnishes feed through the critical period when bluegrass fails.

Mr. Maes says that sweet clover can be seeded in any bluegrass pasture very successfully either spring or summer, if the soil can be scratched at all, providing sufficient lime is added on acid soil and the seed is inoculated and thoroughly worked into the soil.

Good Stand on Rocky Hillsides

Ben Jokerst, in the northwestern part of the state, has untillable, rocky hill pasture, consisting of 70 acres, that he sowed to biennial white sweet clover in February, 1922, with a hand seeder. He did not turn the stock on until August 1, or until the sweet clover was about two feet high. He pastured 45 head on this during August, September, and October. Next year he expects to turn on early in the spring and pasture it all summer.

Mr. Jokerst says, "On some of the rough, rocky hillside that would not grow enough grass on four acres to pasture a cow, as good sweet clover as I ever saw grows. I think next year sweet clover will double the pasture on my place over what bluegrass produced alone on this untillable land."

"I have one pasture on which I let the sweet clover go to seed last summer. The young clover now, (June 22) is about 10 inches high, and as thick as it can stand. I find lots of seed that did not germinate; the stock have tramped it down and it will come up next year. I also find a number of stalks that will make seed this year."

Learning What Can and Cannot Be Done

Mr. W. D. Howland in Northern Illinois has a large permanent bluegrass pasture through which a creek winds. In early March, 1921, he seeded sweet clover into this pasture with a grain drill and got a fair stand. In 1922 the sweet clover made a big growth so that many of the stalks were still standing from one to two feet high, when I visited the pasture that November. In the spring of 1923, he tried putting more sweet clover seed into this pasture with a drill, the same as before, but the bluegrass had not been pastured close the fall before, and there was so much old grass it prevented the drill from cutting through the tough sod, so not much of the clover seed was put into the soil, and he got a very *poor* stand.

He had another bluegrass pasture across the road on a 160-acre farm he recently purchased. This pasture was eaten tight to the ground the fall before, and for this reason there was not as tough a mat of roots and he could disc the sweet clover into the soil here. He did so and got a *good* stand.

A Doubled Yield of Pasture

Mr. H. Ridgway of Northern Illinois had disced six acres of permanent bluegrass pasture on creek bottom twice, and on March 1, 1921, drilled in a mixture of sweet and other clover seed. He got a good stand and it has reseeded itself since, so that he still has a good clover pasture three years after seeding.

He has pastured four cows and four horses on this six acres and says that discing this mixture into the bluegrass has doubled the yield of feed. He also says, "The practice of putting sweet clover into bluegrass pasture can't be beat."

Messrs. Kolmer, Easterly, and Hartman of Southern Illinois have also had the experience of putting sweet clover into bluegrass pasture and having it reseed itself.

Seed Must be Worked Into the Soil

These experiences indicate that sweet clover can be successfully grown in bluegrass pasture if the lime and inoculation requirements are met the same as for growing sweet clover anywhere else. From the successes and failures cited, it also seems essential that the seed be *well worked into the soil.* In many or most cases this will require thorough discing to cut the tough sod.

Best to Use Unscarified Seed Here

In order to have a continuous supply of sweet clover pasture, we must have a stand of both first and second year plants every year. Since sweet clover is a biennial, it does not produce seed the first year and if scarified seed, which will practically all germinate the first year it is used, it will be necessary to work the ground up the second year and sow more seed in order to secure a stand of young plants again that year. For this reason when seeding sweet clover into bluegrass, it is best to sow a double amount of unscarified seed, part of which will not germinate until the second year, thus eliminating the necessity of the extra working of seed into the bluegrass sod the second year.

The Most Economical Method

Of all recommendations to furnish supplementary feed for permanent bluegrass pasture, *growing sweet clover in the bluegrass is by all means the most economical and efficient because it takes no extra fencing and no extra land or labor to grow sup-*

THE BUCKEYE STATE FAIR

HOWARD C. BARKER, OHIO

THE Ohio State Fair slogan, "The Sun Always Shines in Ohio," describes perfectly Ohio State Fair week just past. The week was hot but aside from a slight sprinkle of rain on Tuesday night it was an ideal fair week. Attendance was not as large as that of 1922, by a few thousands, but it reached the 360,000 mark.

Every bit of available space was taken with machinery and agricultural exhibits of every kind. The live stock barns were chock-full of not only the best from Ohio but from other states as well.

The new cattle barn was appreciated much by the exhibitors of cattle and admired by every one who passed its doors. It is the last word in arrangement, ventilation, and light for state fair barns and has a capacity of 1,788 head of cattle on the first floor and 300 head in the basement where an army of nurse cows was kept. The hog exhibitors were able this year to show their swine in the remodeled cattle barn which now accommodates amply the hog show, giving them two excellent arenas for the showing of the porkers.

The dairy cattle exhibit again surpassed that of the beef cattle in numbers and taken as a whole the quality was a bit better than at any former show.

The Brown Swiss had about the usual numbers seen at an Ohio State fair and the quality straight through was very commendable. The 3-year-old bull, Prince of Meadow Green 9427, owned by L. S. Marshall and Sons, of Michigan, was an easy senior champion and later was made grand champion over the excellent senior yearling, Lottie's Prince of Lakeview, owned by Hull Bros., Ohio.

In the female classes one could not help but notice the dairy type that the breeders of Swiss Cattle are obtaining and the show was strong and a bit close in places. Swiss Valley Girl 7th, the winner of many grand champion honors, won the aged cow class and rode along easily to the grand champion female honors over Irene of Lakeview, the senior yearling heifer from the same herd of Hull Bros., Ohio. R. E. Haeger tied the ribbons in his usual satisfactory manner.

In the Jersey class Hugh Van Pelt, of Iowa, ranked the animals very satisfactorily to the Jersey cow fans which included many out-of-state enthusiasts. The Jersey show as a whole was up to its usual high standard at the Ohio State Fair, there being over 200 shown. For the Ohio breeders competition furnished by out of state breeders was a bit too stiff as all the blues except one went to herds without the Ohio borders. The aged cow class was the outstanding class of the show and brought out 25 tip-top Jersey matrons. The grand old cow, Fern's Oxford Diana, finally defeated

FLASHLIGHT OF CEDAR HILL, SENIOR CHAMPION GUERNSEY BULL AT OHIO STATE FAIR
OWNED BY CIRCLE W. FARM, OHIO

her stable mate Fern's Ashley Belle for first place in this class and was later made grand champion female of the show over Fern's Oxford Silver Thread, her half sister and also owned by P. H. B. Frelinghuysen, New Jersey.

The Guernsey show was lacking a bit in numbers as compared with last year but all it lacked in quantity was made up in quality, for some very excellent fawn and white specimens were lead before Judge John Cochran of Pennsylvania for his inspection.

In the bull classes Circle W. Farms of Ohio won both the champions on sons of Brookmeads Searchlight. The excellent two-year-old, Flashlight of Cedar Hill, walked to the front easily for senior champion but was just as easily defeated by his half brother, White's Searchlight's Raymond, for grand champion. Judge Cochran, in the female classes, found his senior champion in the 3-year-old heifer, Imperial Florence of Bas Sejour. She might have shown a bit more depth of middle but aside from this was a real Guernsey cow and experienced little difficulty defeating the junior champion, King Masher's Laddie's Ann, for the grand championship.

The feature of the Guernsey show was the offspring of Brookmead's Searchlight 62912, senior herd sire at Circle W Farm.

Ten of his sons and daughters won eight blues, two championships, and one grand champion. In the groups his get won first prize exhibitors' herd, first prize young herd, first prize calf herd, and first prize get of sire.

Gayoso Farm of Mississippi won first four places in the produce of cow class.

The Holstein-Friesian show, although lacking just a few in numbers over last year, was by far the best ever seen in an Ohio Holstein arena. Hargrove and Arnold came from Iowa for premier exhibitor honors, but aside from their winnings the ribbons were very well divided among the 59 other exhibitors, 54 of which were Ohio breeders. Holsteins again excelled in numbers over all breeds of cattle with 376 head; the Shorthorns, however, being a close second. Every class was well filled but the senior heifer class brought out 50 head and it kept "Bob" Haeger busy to finish the job in the two days alloted to him.

King Pietertje Jewell Korndyke repeated his last year's record handily by winning senior and grand champion in the bull classes. "Jewell" is carrying a lot more flesh this year than last and was an easy winner over Triune Ormbsby Piebe 27th, last year's All American senior calf for the highest honors of the show.

The female classes were large and all of them furnished a most excellent bunch of prize winners. In the aged cow class Ivaloy Prilly Rose Hall, the Ohio State Fair grand champion for the past two years, won in a class of over 40 wonderful dairy cows, but the trim, stylish Dorothy Ormsby Piebe, owned by Hargrove & Arnold and the winner of many championships, was too much for her and "Dorothy" was again senior champion. A few minutes later she met one of the best junior champions ever witnessed on an Ohio tanbark, namely, Wooglin Colantha Fayne, and was made the grand champion female of Ohio's best Holstein show.

One of the best features of the Ohio show each year is the county herd class which has been the one big thing to encourage Ohio breeders to show their cattle.

Seven county herds were shown and ranked as follows: Grange, Lucas, Fulton, Columbiania, Medina, Willington Dist., and Lucas.

The county herd show for the past four years at the Ohio Fair has created much interest and enthusiasm among the small breeders and has been the means of getting out a big show. The State Fair Board and the Ohio Holstein-Friesian Association offers $750 in prize money for this class.

Increasing enthusiasm was evidenced this year for the Ayrshire cow. While the show was not larger than usual, it was well balanced throughout and the prize money was very evenly divided among the exhibitors. Taking the show throughout, there were very few outstanding individuals and, on the other hand, very few poor ones were in evidence. In the female classes the two-year-old and both the yearling classes were of very high merit.

Hillhouse Golden Lad, the deep, white, massive aged bull owned by Shuttleworth Bros. of Michigan, was an easy winner in his class as well as for champion and grand champion honors later on in the show. Alta Crest Farms, Massachusetts, had the junior champion bull, their junior yearling calf, Alta Crest Happy-Go-Lucky.

PRINCE OF MEADOW GREEN, GRAND CHAMPION BROWN SWISS BULL AT OHIO STATE FAIR
OWNED BY L. S. MARSHALL & SON, MICHIGAN

The female senior champion went to the excellent two-year-old heifer, Alta Crest Powder Puff, who had but little difficulty later on winning the grand champion over Alta Crest Bright Lass, the senior yearling that had been made junior champion. "Jimmie" Dodge, Massachusetts, tied the ribbons satisfactorily to all.

The glory of the farmer is that in the division of labor, it is his part to create. He stands close to nature; he obtains from the earth the bread and the meat. The food which was not, he causes to be.—RALPH WALDO EMERSON.

THE Minnesota State Fair this year was fully up to the Minnesota standard, that means a state fair second to none, a fair where one needs more than a single day to properly see it. Like a good many of the other fairs this fall, the attendance was less than usual. Neither the city nor the farmer gave it the support they usually do.

The cow testing association exhibit was one of the educational features which could profitably have been studied by more dairymen. It featured the importance of intelligent feeding for most profitable production and included several cows whose first C. T. A. records were made on dairy farms in different sections of the state. The cows were again tested by the association at the University farms with production increases of well over 2,500 lbs. of milk making an increased net profit of as much as $60 in one case.

The dairy cattle show was very good, being particularly interesting to those who favored Guernseys, Holsteins, or Jerseys. Altogether 821 head were shown, with 153 of these calf club entries which in themselves make most interesting competition.

This fair still has one or two rather antiquated rules among those governing its cattle classes which could, it would seem, well be changed. If a sire is owned by two or more breeders he cannot for some unknown reason be shown in the herd classes. Because his ownership is plural doesn't make him any less a herd sire and ought not to prohibit his being shown as such. Then, too, there is a ruling prohibiting exhibitors from showing more than one entry in a group. Surely if a breeder is using two or three sires and their get prove excellent, there is no logical reason why each may not compete.

Holstein breeders brought out 170 entries this year with Jefferson County, Wisconsin, the only out of state exhibitor. Practically every class was a close one and no one breeder was able to get very many of the firsts. The Minnesota Holstein Co. led in this respect with five blues; Mudcura Farms was second with four.

Judge Weaver had no easy time of it with his Guernseys; almost every class was large and all of them were keenly contested. D. D. Tenney, Minnesota got two championships and one grand championship, the other two purples going to Mountain Bros. and W. W. Marsh of Iowa. The latter's senior champion cow was also grand-champion.

This year brought out the best Jersey show we've seen at Minnesota in some time. There were 156 entries, besides club calves, from herds in Iowa, Wisconsin, and Minnesota. The Meredith Jersey Farm of Iowa with nine firsts was the heaviest winner.

The Brown Swiss show was just about equal to that of 1923. There were 86 head there with entries from Wisconsin, Illinois, and Iowa as well as Minnesota. The Ayrshires made the smallest showing of any breed with 53 head, 37 less than a year ago. Wallis Farms and B. B. Simmons and Sons of Wisconsin and F. H. Baskins of Iowa were the only exhibitors with the exception of one calf club entry from Steele Co., Minn.

A complete list of first prize winners for each breed follows:

Brown Swiss

Judge: Earl Weaver, Iowa.

Bull 4 years old or over—Mooney and Larrabbe, Iowa, on Earl the 6th. Bull 3 years under 4—Fred Reuter, Wisconsin, on Black Stone. Bull 2 years under 3—Fred Reuter on Happy Boy of Gladmont. Senior yearling bull—A. E. Bower and Son, Illinois, on Bonick of Bowerhome. Junior yearling bull—Fred Reuter on Ada's Carl 1st. Bull, senior calf—N. C. Schmid, Wisconsin, on Nelliemilitor.

Senior and grand champion bull—Mooney and Larrabbe on Carl the 6th. Junior champion bull—Fred Reuter on Ada's Carl 1st.

Cow 4 years or over—A. E. Bower and Son on Betty of Lake View. Cow 3 years under 4—A. E. Bower and Son on Nickduchess of Bower Farms. Cow 2 years under 3—N. C. Schmid on Brown Ethel Monroe. Senior yearling heifer—N. C. Schmid on Marvel M 2nd Hazel. Junior yearling heifer—N. C. Schmid on Mernervie of Meadow Green. Senior heifer calf—Lila Schmid on Browny A's Last.

Senior and grand champion cow—A. E. Bower and Son on Betty of Lake View. Junior champion heifer—N. C. Schmid on Mernervie of Meadow Green.

Graded herd—Mooney and Larrabbe. Yearling herd, pair calves, N. C. Schmid; get of bull—N. C. Schmid on Vronicka's College Boy. Produce of cow—N. C. Schmid. Dairy herd—A. E. Bower and Son.

Ayrshire

Judge: R. S. Hulce, Wisconsin.

Bull 4 years or over—Ayrcroft Farm, Wisconsin, on Cavalier The Last. Bull 3 years, under 4—H. M. Wallis, Wisconsin on Cavalier's Bobby Vernon. Bull 2 years under 3—H. M. Wallis on Edgerstoune Premium Bond Imp. Senior yearling bull—F. H. Baskins, Iowa, on Cavalier's Morning Star. Junior yearling bull—Ayrcroft Farm on Ayrcroft Cavalier Lord. Bull, senior calf—Ayrcroft Farm on Ayrcroft Cavalier Red Boy.

CAVALIER'S BOBBY VERNON, FIRST PRIZE THREE-YEAR-OLD, SENIOR AND GRAND CHAMPION AYRSHIRE BULL
OWNED BY H. M. WALLIS, WISCONSIN

Senior and grand champion bull—H. M. Wallis on Cavalier's Bobby Vernon. Junior champion bull—Ayrcroft Farm on Ayrcroft Cavalier Lord.

Cow 4 years or over—H. M. Wallis on Lucindy of S. C. 2nd. Cow 3 years under 4—Ayrcroft Farm on Ayrcroft Ethel. Cow 2 years under 3—H. M. Wallis on Cavalier's Daisy. Senior yearling heifer—Ayrcroft Farm on Ayrcroft Snow Lillie. Junior yearling heifer—H. M. Wallis on Gladys of Wallis Farm. Senior heifer calf—H. M. Wallis on Edgerstoune Piry.

Senior and grand champion cow—H. M. Wallis on Lucindy of S. C. 2nd. Junior champion heifer—Ayrcroft Farm on Ayrcroft Snow Lillie.

Graded herd—H. M. Wallis. Yearling herd and pair calves—Ayrcroft Farm. Get of bull—Ayrcroft Farm on Cavalier The Last. Produce of cow and dairy herd—H. M. Wallis.

Guernsey

Judge: Earl Weaver, Iowa.

Bull 4 years or over—Albert L. Hyzer, Wisconsin, on Lassie Boy of Prairie. Bull 3 years under 4—D. D. Tenny, Minnesota, on Cherub's Royal Leader of Shorewood. Bull 2 years under 3—Mountain Bros., Iowa, on Kitchener's Cavalier of Iowanola. Senior yearling bull—W. E. Harrington, Minnesota, on Mosrose Cherub. Junior yearling bull—Mountain Bros. on Dorothy Marie's Challenger of Iowanola. Bull, senior calf—W. E. Harrington on Cherub's Lad of Grace.

Senior and grand champion bull—D. D. Tenny on Cherub's Royal Leader of Shorewood. Junior champion bull—Mountain Bros. on Dorothy Marie's Challenger of Iowanola.

Cow 4 years or over—W. W. Marsh, Iowa, on Honey Bloom of the Prairie. Cow 3 years, under 4—Albert L. Hyzer, Wisconsin, on Guernseydale Barbi. Cow 2 years, under 3—D. D. Tenny on Cherub's Lassie of Shorewood. Senior yearling heifer—W. W. Marsh on Lilac of the Prairie. Junior yearling heifer—D. D. Tenny on Honor's Canterbury Cherub. Senior heifer calf—Marple C. Mountain, Iowa, on Cherub's Beautona of Iowanola.

Senior and grand champion cow—W. W. Marsh on Honey Bloom of the Prairie. Junior champion heifer—D. D. Tenny on Honor's Canterbury Cherub.

Graded herd—D. D. Tenny. Yearling herd—Mountain Bros. Pair calves—W. E. Harrington. Get of bull—D. D. Tenny on Ladysmith's Cherub. Produce of cow—W. W. Marsh. Dairy herd—Simon Kruse, Minnesota. Minnesota County Group—Hennepin County. State Herd—Minnesota.

Jersey

Judge: R. S. Hulce, Wisconsin.

Bull 4 years or over—D. A. Buss, Minnesota, on Golden Isabella's Noble. Bull 3 years under 4—Waterloo Jersey Farm, Iowa, on Financial Master. Bull 2 years under 3—Meredith Jersey Farm, Iowa, on Successful

GMC

GMC Trucks are "Seven Steps Ahead"

A Truck Without "Off Days"

The mechanical steadiness of GMC is a big reason why it should be chosen for dairy farm hauling.

A GMC is always ready to go when you are—and as prompt as meal-time in getting back.

Here's why. GMC is built by an organization that started to building trucks when the truck industry started. *Experience!* It is built of the very finest materials available regardless of price. *Quality!* GMC design is simple and trouble-proof with extra strength designed into every part. *Reliability raised to perfection!*

You can depend on a GMC. Its only "off days" are those its owner gives it. Ask for catalog.

THE FUTURE HERD SIRE

C. H. CRAWFORD, INDIANA

SOONER or later every breeder of pure-bred cattle is confronted with the problem of purchasing or selecting a sire to head his herd.

It has been truthfully said that the herd sire is half the herd. This, perhaps, does not seem true, but when we stop to consider that the herd bull has direct influence on the coming generations; that through his influence the improvement of the herd is either retarded or promoted, then we begin to realize the importance of careful and wise selection of the herd sire.

During the earlier days breeders selected their bulls largely on their individual merit, or, perhaps, more often on the price asked for the animal. But today, bulls are selected not only on their individual merit but also on the ability of their ancestors, as indicated by their official records of production.

The pedigree of the herd bull then, is important and is termed excellent, good, or poor according to the records of production of the animals.

The pedigree of a bull which shows his female ancestry all to have good records of production, and his male ancestors to have been sires of high producing daughters, would be classified as *excellent*. The opposite conditions would be true of a very poor pedigree, with *good* and *poor* indicating the pedigrees intermediate between the two extremes.

In order to improve his herd, a breeder selects a bull which he thinks will transmit his good qualities to his offspring and thereby increase the production of the herd. In order to do this it is believed that, through the influence of heredity, the majority of a bull's ancestors must have high records of production.

With this thought in mind the author has made a rather intensive study of the pedigrees and production records of the daughters of the ten bulls of the Holstein-Friesian breed having the largest number of daughters in the Advanced Registry. Conclusions drawn from the correlation of the pedigree of these bulls to their performance should aid in the selection of your next herd sire.

Since these ten bulls have more A. R. O. daughters than any other bulls of the breed, their records of performance can, without question, be taken as a standard which can be used for further comparison.

The average of all records of the 1511 daughters of these ten bulls shows their average production of butter in seven days to be 21.31 pounds in thirty days it was 99.81, and in one year it was 777.45 pounds.

When these ten bulls are compared to ten other bulls which were selected entirely on the merits of their pedigree and all of which have excellent or good pedigrees, the later group was found to have a slight increase in the amount of butter produced by their daughters in seven days, a very slight decrease in the amount produced in thirty days, and a decided increase in the average yearly production of their daughters. In seven-day records they ranked 103.23 per cent, in thirty-day records 99.86 per cent, which is practically the same, and in yearly records they ranked 110.06 per cent, with an average rank of 104.79 per cent.

It is of interest to note that when further comparison was made between bulls having good pedigrees and bulls having excellent pedigrees, that the bulls having excellent pedigrees were able to transmit higher production to their daughters, their daughters showing an actual increase of 5.10 per cent for their seven-day records, an increase of 10.62 per cent for their yearly records, and an average increase for all records of 4.79 per cent over the production made by the daughters of the bulls which had good pedigrees.

Again, in like manner, when the production records of daughters of bulls having only poor pedigrees were compared to the records made by the daughters of the ten bulls having the greatest number of A. R. O. daughters, these bulls had an average rank of 86.49 per cent for seven-day records, 98.3 per cent for thirty-day records, and 94 per cent for their yearly records, with an average total rank of only 88.47 per cent.

When still further comparison was made of the production of the daughters of bulls having poor pedigrees, to the production of the daughters of bulls having good pedigrees, the bull with poor pedigrees had a rank of 83.78 per cent for seven-day records 98.61 per cent for thirty-day records and 82.61 per cent for yearly records with an average rank of only 84.4 per cent.

These comparisons have shown:

1. That records made by cows sired by bulls having good pedigrees, were nearly five per cent higher than similar records made by daughters of bulls which have unquestionable records of performance.

2. That production of females whose sires had pedigrees classed as excel

A MILKING CONTEST AT THE MICHIGAN MILK PRODUCERS' PICNIC BETWEEN N. P. HULL, (RIGHT) PRESIDENT MICHIGAN MILK PRODUCERS' ASSOCIATION, AND M. L. NOON, PRESIDENT OF MICHIGAN FARM BUREAU

The contest was decided on the points of sanitation, celerity, gentleness, quality of voice, and milking ability. To determine these qualifications in the contestants a foot race was held, a whistling match, method of approaching the cow, a manicurist inspected their hands, and each was required to milk a dry and a fresh cow.

Both were confident of winning; both were disappointed when judges decided the contest a tie.

lent was greater than the production of the daughters of bulls having pedigrees classed as good.

3. That the production of the daughters of bulls having poor pedigrees was more than sixteen per cent less than the production of daughters of bulls which had good pedigrees.

These data show conclusively that in order to sire high producing daughters a bull must, himself, have high producing ancestors. High production does not come by chance, but it is an inherited character, transmitted from one generation to another. Good cows possessing this character cannot reach their maximum production without good feed and proper care. On the other hand, good feed and the best of care cannot make large records unless the cow possesses the inherent character for high production.

Relation Between Human and Bovine T. B.

HOARD'S DAIRYMAN:—I was much interested in the Illinois Dairyman's twelve reasons for not testing his herd for tuberculosis as given in your paper. Among other things he states that no one is very sure of the relation between human and bovine tuberculosis, nor very sure of the efficiency of the tuberculin test, etc. Right along this line we would like to say a word.

Your Illinois correspondent does not state who it is that doubts the relationship between human and bovine tuberculosis. There is no better authority on this subject in the United States than Dr. M. P. Ravenal, professor of preventative medicine and bacteriology and director of the public health laboratory at the University of Missouri who has made this subject a study for about 26 years and whose remarks along that line should be of some real value.

This is what Dr. Ravenal says on the subject: "I do not understand why it is that this question which was apparently settled some 20 years ago, has broken out freshly again. During the last six months I have had so many inquiries concerning the matter that I feel that there must be some sinister force at work. There is no question whatsoever that cattle tuberculosis is transmissible to man. This has been definitely settled by the work of the Live Stock Sanitary Board of Pennsylvania in 1901 and 1902. Later than this, the English Royal Commission and the German Imperial Commission made their reports concerning the work done in this country on bovine tuberculosis. I have been working on this subject since 1898 and have collected a vast amount of material not only in this country but also in Europe. At the present time I do not know anyone whose opinion is worth having who does not acknowledge the danger of cattle tuberculosis to human beings. The danger is chiefly to children but sometimes adults are affected also. All of the material which has been brought forward from year to year simply strengthens the positive stand taken."

This does not look as if there was much dispute about the matter.

Most everyone is familiar with the work of the Mayo Bros. Hospital at Rochester, Minnesota. Patients come to this hospital from all over the world. Here is what the Mayos say about the relation of bovine and human tuberculosis: "Bovine tuberculosis is very common in children from the rural districts. It comes in the form of tuberculosis of the tonsils, glands of the mesentery of the intestines, or ulceration of the intestines, frequently locating in the peritoneum or in the appendix."

Dr. A. Stanley Griffith, an investigator with the British Royal Commission of Tuberculosis, stated in 1922 at the National Milk Conference that in the study of 1,200 cases of tuberculosis in children under five years of age, more than 80 per cent of the cases in the lymph nodes and abdomen were of the bovine type. He also said that the bovine type was capable of giving rise to the disease in every organ, every joint, and every gland in the human body.

Statements are made from time to time that the tuberculin test is not effective. Right along this line, Dr. Herman Busman in charge of meat inspection at the South Omaha packing plants, has something of interest to say. Checking up the carcasses of animals which have reacted to the tuberculin test and are slaughtered and given post-mortem examinations, shows that practically 100 per cent of these cattle have the disease in some form or another. So it will be seen that there is little or no guesswork about the matter.

Here in Nebraska a dairyman, who had his herd tested, was keeping those animals which reacted in quarantine. Contrary to regulations, he allowed calves to go in and suck these cows. Nearly all these calves contracted the disease. Then he realized that the tuberculin test must have told the truth.

Nebraska. H. HOWARD BIGGER.

Bovine Psychology

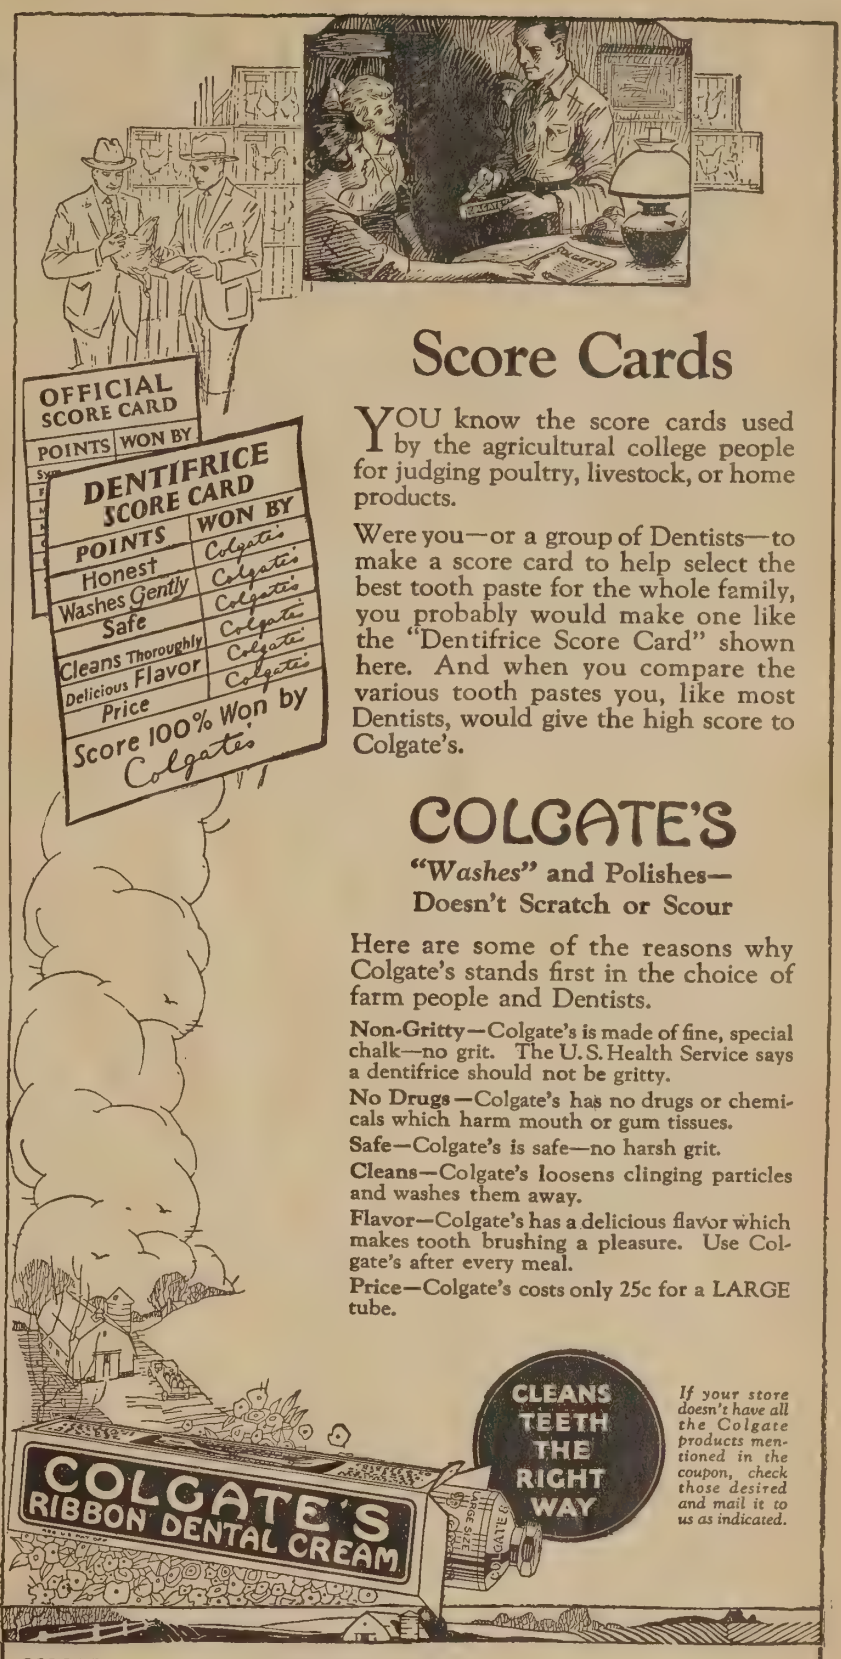
HOARD'S DAIRYMAN:—The milking cow generally has a nervous temperament—very often this is magnified in proportion as she is closely bred and high producing. "Melba XV", the world's champion butterfat cow, is, for her kind, of a placid, docile disposition. This was in her favor during the recent prolonged test when she produced 32,522½ lbs. milk and 1,614 lbs. fat in 365 days. Great care was exercised that she should be milked regularly at eight-hour intervals, fed regularly, and treated kindly and gently. Her care, with that of several of her herd mates, was the duty of one person. To him a great amount of credit is due. If a stranger milked these special cows the change was demonstrated by decreased yields.

To show the strong bond of attachment existing between this herdsman and his charge, it is worthy of note that during the last days of December, his little daughter was stricken with pneumonia and lay in a hospital hovering between life and death, the mother leaving her home for the time being in order to be near the sick bed. The father went about his duties mechanically, ready for the message to call him to what he feared might be the last farewell to his child. The two cows, his special care at the time, "Melba XV" and "Melba XVII" simultaneously went off their feed and gave diminished quantities of milk. His grief seemingly was contagious, the faithful animals showing their affection and anxiety for their kind friend in this way.

This incident should be brought under the notice of all those who have the charge of dumb animals; it should inculcate in them a better understanding and a determination to never again ill-treat a cow, horse, or other animal. Meriting the affection of these two animals is more to the credit of this herdsman than being a prime factor in one of them putting up a world's record yield of butterfat.

Australia. W. G. HENDERSON.

Put Soft Corn in the Silo



Soft corn, of which there will be large quantities in Minnesota this year, is a crop difficult to save without loss of feeding value. The best authorities, says Andrew Boss, vice director of the Minnesota Experiment Station, agree that a soft corn crop can best be saved without loss by putting the ears, stalks, and all into a good silo.

"If possible, the corn should be put in before freezing," says Mr. Boss. "It is difficult to anticipate when killing frosts will come, however, and sometimes corn is badly frozen before cutting. In such cases the corn should be cut just as soon as possible after the frost. Frosted leaves soon dry out, winds blow them off and the loss of feed is large.

"Even if the corn cannot immediately be put into the silo it should be cut as soon as possbile after the frost. With very immature corn it is advisable to wilt it before putting it in the silo. The wilting will require one to three or four days depending on the weather. When the corn is cut with a corn binder and thrown off in bundles, it may be allowed to lie on the ground for several days without injury.

"If the corn should be frozen and should stand for some time afterward before cutting, the wilting may not be necessary. Where corn is badly dried out after freezing it may be necessary to add water to provide sufficient moisture for the proper curing of the silage."

"I went to the zoo," said Elsie, excitedly, "and I gave the elephant a piece of candy. And—ooh! You should have seen him pick it up with has vacuum cleaner!"—Good Hardware.

Score Cards

YOU know the score cards used by the agricultural college people for judging poultry, livestock, or home products.

Were you—or a group of Dentists—to make a score card to help select the best tooth paste for the whole family, you probably would make one like the "Dentifrice Score Card" shown here. And when you compare the various tooth pastes you, like most Dentists, would give the high score to Colgate's.

COLGATE'S

"Washes" and Polishes—Doesn't Scratch or Scour

Here are some of the reasons why Colgate's stands first in the choice of farm people and Dentists.

Non-Gritty—Colgate's is made of fine, special chalk—no grit. The U. S. Health Service says a dentifrice should not be gritty.

No Drugs—Colgate's has no drugs or chemicals which harm mouth or gum tissues.

Safe—Colgate's is safe—no harsh grit.

Cleans—Colgate's loosens clinging particles and washes them away.

Flavor—Colgate's has a delicious flavor which makes tooth brushing a pleasure. Use Colgate's after every meal.

Price—Colgate's costs only 25c for a LARGE tube.

If your store doesn't have all the Colgate products mentioned in the coupon, check those desired and mail it to us as indicated.

EDITORIAL COMMENT

THE lateness of this year's corn crop emphasizes again the necessity of having soils rich in all the elements of fertility, and especially phosphorus. Lands which have a good available supply of phosphorus, and all other soil conditions favorable, have produced the best crops of corn. Phosphorus assists corn to ripen early. In other words, it hastens maturity. No element of fertility is more required for building a well balanced soil than phosphorus. It can be generally stated that most soils which have been producing crops for a series of years lack in phosphorus and will be improved by the application of some form of phosphoric fertilizer.

EVEN though frosts do not come until October, there is no hope of securing a one hundred per cent ripe corn crop. The season has been better adapted to growing small grains and hay than corn. It is perhaps unnecessary to call attention to the fact that owing to the high percentage of soft corn, extra care must be given in the selection of seed for next year. Indications are that seed corn will be scarce and high in price and the farmers who have a good percentage of matured corn will undoubtedly find it profitable to save more than the ordinary quantity of seed. In many instances it will be wise to select seed corn from the crib of last year's crop. Owing to the lateness of corn, it will pay every corn raiser to give more than passing attention to the selection of seed corn for planting in 1925.

SALT ESSENTIAL

It is more essential to provide the dairy cow with an adequate supply of salt than any other animal on the farm. In the manufacture of milk, she requires considerable salt and unless it is provided in liberal quantities, she will develop an abnormal appetite, dull eyes, a rough coat, and in the end there will be a complete breakdown. Dairy cows require varying quantities of salt. Those who are producing large flows require more than those producing small quantities. In a feed report of one of the leading dairy cows, it was stated that she consumed 50 pounds of salt in a year, or more than two ounces per day. This seems like a generous quantity of salt, but it was none too much considering the work that she did in the year.

We have considered it a good practice to mix with each 100 pounds of feed from one-half to one pound of salt and then arrange so that the cows may have free access to salt. This method will provide all the salt an animal requires and does away with any danger of neglecting to provide salt in adequate quantities.

CAN WE SEE OR NOT SEE?

To demonstrate how little each one of us observes of an incident, and how inaccurately we will relate it, if called upon to do so, the Kiwanis Club in a little city in Southern Wisconsin put on the following stunt:

A stage was arranged and a doctor was seated at a desk when one of his patients entered to pay a bill. It amounted to $62.00 and this amount of paper money was handed to the doctor and the patient walked out. At this moment a highwayman appeared, drew a revolver, and fired two shots. The doctor fell to the floor. The highwayman picked up the $62, placed it inside of a magazine, carefully closed it, and then put the money and magazine on the table. He then laid the revolver on top of the magazine and left the room. The curtains were drawn. A dozen men, members of the Club and who had seen the incident, were asked to leave the room. Then each was invited back to the room singly and asked to describe the incident. Not one of them could give a complete statement of what took place. Some said four shots were fired; others, one. The majority of them said the highwayman put the money in his pocket; others stated he put the money in the magazine but took the revolver and disappeared. The members were asked to describe the person who did the shooting. He was not masked. He was dressed in his usual manner and a member known to all of them. A majority did not recognize him and some thought he wore a mask. In short, not one of the number gave a complete outline of what took place and no two told the same story.

In conferring with a lawyer regarding this incident, he made this remark: "Whenever three or four witnesses in a trial tell the same story, we know they are lying."

The incident which we have described is simple but it does reveal poor observation and comprehension. It indicates that each one of us should be more careful in our statements whether they be made orally or in writing and that we should read and observe carefully if we are to get a clear and accurate understanding.

HOW TO INCREASE YOUR WEALTH

Wisconsin has 168 cow testing associations in operation with 76,101 cows on yearly test for 4,471 dairy farmers. Records were secured on fifty thousand of these cows last year, the average production being 7,106 pounds milk containing 273 pounds butterfat. This production is 44 per cent in excess of the average for all cows in Wisconsin.

A somewhat more striking comparison is contained in the following paragraphs from Mr. Cramer's annual report:

"The average Wisconsin dairy farmer can increase his income fifty per cent. This is not a 'get rich quick' scheme, nor a plan to sell 'blue sky' oil stock. Briefly the plan is this:

"The average cow, on the average farm where a scrub sire presides over the mixed herd and no testing is done and no milk sheet kept, does well to average 175 pounds of butterfat a year. On the other hand, the cows in carefully kept herds, tested in a cow testing association, fed in accordance with modern methods, and headed by a purebred sire, seldom average less than 275 pounds fat a year, and in such herds pound-a-day cows are common. Many, of course, maintain still higher records.

"It is obvious, then, that all the average dairyman has to do to increase his income fifty per cent or more is to get rid of his scrub sire, weed out his boarder cows, adopt modern feeding methods, and check up on his animals through a cow testing association. Some have already taken this method to the benefit of their bank account. Others are about to take the step. But there are still others who will continue in slipshod ways, working along the same old lines, ignoring modern methods, and then bitterly upbraiding fate, conditions, and the other fellow, for their misfortunes and lack of prosperity. Too often these very people are the ones who will invest their slender funds in wild-cat schemes, ignoring the opportunity for wealth that is at their very door."

PROPAGANDISTS ALWAYS BUSY

Since the tuberculin test has been used for determining animals suffering from tuberculosis and their elimination, there have been individuals opposed to it. At present more cattle are being tuberculin tested and better plans are being followed for the eradication of tuberculosis and preventing infection of the healthy animals, than at any time since the inception of the tuberculin test. Still we have individuals and even organized effort to defeat this splendid work. These objectors to the tuberculin test base their arguments upon false premises. They use the errors and the dishonest efforts of a few who have applied the tuberculin test as arguments against its application. Mistakes have been made, false statements have been made concerning its value, and incompetent and even dishonest men have applied the test. These things have caused some good men to doubt its value. This is unfortunate, but it is not a just argument against tuberculin testing or tuberculosis eradication. The ordinary scale with which we weigh all our commodities gets out of order and dishonest men do weighing, but no one thinks of doing away with the scale because of these happenings. We proceed to adjust the scale which is out of order and to replace the man who will not operate it properly.

In comparison with the extensive tuberculin testing work which has been done, comparatively few mistakes have been made, and since the plan for cleaning up whole counties has been adopted, splendid progress is being made. Nevertheless, the propagandists against tuberculin testing cause many uninformed farmers to wonder whether it is to their advantage to attempt to free their herds and flocks from tuberculosis.

The eradication of bovine tuberculosis is no small job. It requires intelligent and painstaking work upon the part of the owners of live stock if substantial progress is to be made. The work already done brings overwhelming evidence that, if the tuberculin test is rightly applied and the animals and the premises on which disease is found are properly handled, rapid progress can be made in the eradication of tuberculosis. The results obtained in testing whole counties bring strong testimony as to what can be done if we proceed in the proper way. The tuberculin test is not infallible, but it is the best diagnostic agent we have, and since substantial progress is being made with this test in the eradication of tuberculosis, we see no reason why any farmer should follow those who are putting forth false arguments against the test. The question merely resolves itself into this: Shall we, through systematic use of the tuberculin test, proceed to destroy bovine tuberculosis, or shall we permit it to run its course and claim annually millions of dollars' worth of live stock, and to continue to endanger the health of our children?

Selecting Grain According to Price

I have fifty head of registered Holstein cows. About half of them will freshen during the fall and the remainder at different times during the year. I want to make up a balanced ration, taking into consideration the prices of the different feeds. We grow alfalfa in abundance and harvest it just as it starts in bloom, save the leaves and stack so that it will discolor and be soft and pliable. We will feed only first and third cutting and sell second cutting as the cows don't like second cutting nearly as well. Will give them all the alfalfa they will eat. We will also have plenty of ensilage with ears left on and find it best to feed only about thirty or thirty-five pounds a day in order to get the cows to eat more alfalfa. I can buy old process linseed oil meal and 40 per cent protein cottonseed meal for $54.50 per ton at the ranch; wheat bran for about $28 and mill run for $30. Corn meal would now cost $52 and rolled barley about $48. This makes the last two feeds prohibitive in my opinion. How much of the linseed and cottonseed meal and either wheat bran or mill run would it be advisable to feed per day?

Sunnyside, Washington. S. E. C.

Our inquirer is in position to make a very good ration for his cows, for alfalfa hay and corn silage alone produce very good results. Under most conditions, however, some grain should be fed, even with these two good roughages, for the cows will remain in better physical condition, their milk flows will be sustained longer, and their offspring will be stronger.

We would let each cow have all the alfalfa hay she cares to consume and about 30 lbs. of silage per day. Since alfalfa is rich in protein, considerable corn can be used in the mixture, and corn at $52 a ton is cheaper than oil meal or cottonseed meal at $54 per ton; that is, the total nutrients are cheaper. If a person is looking for protein, then the oil meal and cottonseed meal furnish it several times cheaper than corn. In this particular case total nutrients are looked for quite as much as for protein. In view of this,

both barley and corn may be used liberally and will make a cheaper mixture than if a large quantity of oil meal or cottonseed meal were used.

A very good mixture to supplement silage and alfalfa hay is as follows: Ground barley, 300 lbs.; ground corn, 200 lbs.; bran, 300 lbs. Unless it is desired to have the cows do exceptionally well we would not use either oil meal or cottonseed meal. If the best milk flows are desired then we would add to the mixture already suggested, 50 lbs. oil meal and 50 lbs. cottonseed meal. Feed about one pound of meal for each 3½ lbs. to 4 lbs. of milk produced.

Contagious Abortion Questions

The following is a series of questions submitted by a South Dakota reader, together with answers by Dr. E. C. Schroeder of the U. S. Bureau of Animal Industry:

QUESTION 1: In case a cow has aborted to what extent can one rely on a blood test to show whether contagious abortion was the cause rather than a possible injury?

ANSWER: If a cow has aborted and reacts with an abortion blood-test, the only reasonable conclusion is that the cause was bovine infectious abortion.

The best available data indicate that upwards of 90% of all abortions among cattle are bovine infectious abortions, but the presence of bovine infectious abortion in a herd does not prevent the occurrence of abortions from other causes.

Abortions due to injuries are of rare occurrence unless the injuries are quite severe.

QUESTION 2: For how long after a cow has aborted or had retained afterbirth will a blood test show evidence of infection?

ANSWER: The length of time the blood of a cow may react with abortion tests after she has aborted or had retained afterbirth due to bovine infectious abortion varies greatly. In rare cases it may cease to react after four or five months; more commonly it continues to react two to three years, and it may continue to react the balance of the cow's life.

Reactions with the blood abortion tests vary greatly in strength. Studies are now in progress to determine whether the tests can be made serviceable to distinguish between cattle that actually have abortion germs in their bodies, and are therefore carriers and likely disseminators of the germs, and cattle that have been infected but the bodies of which no longer harbor the germs.

Those who know how much careful, tedious, technical work must be done before we can say with reasonable certainty at what degree of strength a reaction with the blood tests may be indicative only of past or former infection, and at what degree it indicates the presence of infection, need not be told that some time is apt to pass before the required data have been secured to support safe conclusions regarding this broader use of the tests.

It must always be kept in mind that apparently healthy cattle, which have never shown a sign of infectious abortion, may be carriers and disseminators of infectious abortion germs. Cattle of this kind expel abortion germs from their bodies in a dangerous way during and for a short time after, and probably for a short time before, parturition. Such cattle, notwithstanding that they calve normally and produce healthy, vigorous calves, as far as we know, invariably react strongly with the abortion blood tests, and the blood tests are the only known means to distinguish between them and abortion free cattle.

QUESTION 3. Where one cow in a herd has aborted, could one depend on a blood test of each of the other members of the herd to show which are carrying the disease in their systems?

ANSWER:—When one cow in a herd has aborted, a single blood test of the other members of the herd would reveal most but not necessarily all the infected animals. After a cow's body has been invaded by infectious abortion germs a varying period of time, the precise maximum duration of which has not yet been determined, passes before those changes in her body have occurred on which the blood tests depend. At present it may be assumed that cattle which have not been exposed to abortion infection for a period of from 30 to 40 days, and which do not react with blood tests, are free from the infection.

For example, if an abortion of the bovine infectious kind occurs in a herd and all the members of the herd are tested, and all those that do not react are removed to a place where they will not be exposed to infection, a second test without reactions, after the passage of at least 30 days, is required to prove that the cattle which failed to react with the first test are free from the infection.

QUESTION 4: If a blood test showed no evidence of the disease could one depend on that individual to carry her calf full time and to calve normally?

ANSWER: If a blood test showed no reaction, and the animal had not been exposed to infection during at least 30 days before the test was made, and thereafter was protected successfully against exposure to infection, she would carry her calf to full time and have no parturient troubles so far as bovine infectious abortion is concerned.

The absence of a reaction with a blood test, if the cow is exposed to infection, cannot be interpreted as signifying that she will carry her calf to full term. The abortion germ, unfortunately, may cause an abortion in less time after it enters the body of a cow than is required for the development of the changes on which the blood abortion tests depend. Plainly, while cows usually react with the abortion tests before they abort, a small proportion of exposed cows abort first and do not react until a number of days later.

The blood tests for bovine infectious abortion must not be mistaken as a means to distinguish between cows that are apt to abort and those that will not abort. They are serviceable only to distinguish between cattle that are infected and those that are not infected with abortion germs. Precisely like any other disease, bovine infectious abortion is so mild in some individuals that they wholly fail to show symptoms of its presence, and so severe in others that everything the disease can possibly do is clearly apparent. The severity of the disease in different individuals depends both on the susceptibility of the individual and the virulence of the germ, neither of which in the light of our present knowledge can be measured with abortion blood tests.

QUESTION 5: (a) Is the bull now considered to be a factor in spreading the disease? (b) If so, would a blood test show whether or not he is carrying it? (c) Would it be safe to introduce a bull calf that had never served a cow from a contaminated herd into a clean herd as herd sire?

ANSWER: (a) The bull may be a serious factor in spreading abortion disease if he is not properly handled, but not because he infects cows at the time of service. If he is kept in a bull pen and is permitted to come into contact with cows only on neutral ground and during the time of service, so far as can be judged from the available experimental and practical evidence, he is not a factor in the spread of bovine infectious abortion. The term, neutral ground, is used to designate ground to which cattle do not have access excepting at the time of service.

After a cow has been served by a bull of doubtful character she should be kept away from other cattle until all danger that infected material introduced by the bull may leak from her vagina has passed.

Whether a bull, promiscuously used, may spread other diseases of the reproductive organs than bovine infectious abortion, is a separate question. The answer here given concerns only bovine infectious abortion.

(b.) Blood tests made not less than 30 to 40 days after his last exposure to infection, would show whether a bull is an actual carrier of abortion germs.

(c) No animal, either male or female, young or old, from a known infected herd should be introduced into a clean herd until a blood test has shown it to be free from infection. At times young bulls and heifers, which have not had sexual intercourse, are infected with abortion germs.

It is less difficult and expensive to hold young stock from infected herds in segregation five to six weeks, and then prove it free from bovine infectious abortion with the blood tests before it is introduced into a clean herd, than it is to get rid of bovine infectious abortion that may be introduced into a herd by either young or old stock.

Emphatically, no animal of any age should be introduced into an abortion-free herd until it has been proved free from infectious abortion with a properly made abortion test. Infectious abortion is too common and widespread for an owner of a clean herd to take unnecessary chances with possible carriers of its germs.

QUESTION 6: What are now considered to be the factors in spreading the disease?

ANSWER: The most widely recognized factors in the spread of bovine infectious abortion are the abortion germs expelled by the aborting cow; the abortion germs expelled by the non-aborting, infected cow at the time of parturition, and the leakage of infected material from the penis of the infected bull if he is so kept that it may soil the feed and drink of susceptible cattle.

Probably nothing has contributed more to the spread of bovine infectious abortion than infected cows with good breeding records. Such cows do not abort but often are persistent carriers of abortion germs, which they may expel in large numbers at every seemingly normal parturition, via the vagina, for a period of time varying from a few days to a few weeks. There is only one way to detect such cows, and the way is the blood test. Cows of this kind, shortly after they have calved, may be introduced into clean herds and remain there a year or longer, until they calve again, and do no harm. When they calve again, under conditions which expose a herd to material discharged from their uteruses via their vaginas, the trouble soon begins; first an abortion or two and then a larger number of abortions and incidental breeding troubles. A good adage is, "Trust no cow until an abortion blood-test without a reaction has been made".

QUESTION 7: Would it be safe to take a clean herd onto a farm from which an infected herd had just been removed?

ANSWER: No, it would not be safe to take a clean herd onto a farm from which an infected herd had just been removed. Data are available to prove that abortion germs may live in aborted fetuses and afterbirth for several months, and the time that must pass before abortion germs in shady, moist places lose their virulence has not been definitely determined. A sunny pasture that has been thoroughly cleaned after the removal of an abortion infected herd probably is safe after the passage of 5 to 6 weeks; a shaded pasture would remain infected a longer time than a sunny pasture, and stables would remain infected for a length of time dependent upon their character, the thoroughness with which they are cleaned and the manner of their disinfection.

QUESTION 8: Any information that you can give that is not covered by these questions would be greatly appreciated. Please send me or tell me where I can obtain the latest available literature on this subject.

ANSWER: The literature on bovine infectious abortion is widely scattered through technical journals, and its character, owing to the advances made in the knowledge of the disease during the last 8 to 10 years, would be apt to mislead rather than help readers who are not qualified to analyze it. A bibliographic list therefore probably would have little or no value for the general reader and could be prepared only with the expenditure of considerable time and labor.

The most important facts about bovine infectious abortion that have a bearing on the spread of the disease may be summarized as follows:

1. Cows often are carriers and disseminators of abortion germs without showing signs of their infected condition. They have been known to harbor abortion germs in their udders continuously for a number of years without showing a single symptom of disease. The abortion germs in the udder often reach the uterus during pregnancy and are discharged in large numbers during parturition even when they cause no observable disturbances.

2. The dissemination of abortion germs is greatest and most dangerous when the contents of the pregnant uteruses of infected cows are expelled, irrespective of whether this occurs in the form of abortions or seemingly normal parturitions.

This is the reason for recommending the use of maternity pens or stables, to which all cows should be moved the moment they show signs of a threatening abortion or an approaching parturition, and in which they should remain until all discharges from their vaginas have ceased.

3. Leakage from the penis of an infected bull, if it reaches the feed or drink of cattle, is dangerous. Hence, the recommendations regarding the use of bull pens and service on neutral ground.

4. As infected cows may carry abortion germs in their udders continuously for years, all skimmilk and whey returned to the farm from creameries and cheese factories should be heated sufficiently to kill disease germs before it is fed to animals.

5. Infectious abortion is so widespread and common that no bovine animal should be trusted as free from disease unless it is proved so with an abortion test.

6. The exhibition of cattle at shows and sales, unless their feed and drink are scrupulously protected against contamination with anything that is expelled from the bodies of animals, probably is a commoner cause for the spread of infectious diseases than it is recognized to be, and this is particularly true of diseases like bovine infectious abortion and tuberculosis, the germs of which may be carried and disseminated by their subjects long before evidence of disease or symptoms are observable.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Dec. 10-12—Wisconsin Cheesemakers' Association meets in Milwaukee Auditorium. J. L. Sammis, Secretary.

Seventy-three Looks Back

HOARD'S DAIRYMAN:—At the age of seventy-three one can look back over a long vista of the path of life and—if he has been at all observing—should have gained some useful knowledge from what he has seen and experienced along the path which he has traveled.

My father "entered"—as they called it at that time—eighty acres of government land in southern Wisconsin, securing a "patent" for it from Franklin Pierce (then President), and began as a pioneer wheat farmer, but I cannot recall a single instance when his wheat furnished the money for any large payment. It was always the stock which had to be depended upon to furnish the money with which to meet the larger payments.

I remember that during Buchanan's administration, when cows sold for $12 to $14 apiece in gold and a man could earn fifty cents a day in winter and a dollar a day in summer, Father bought an adjoining forty acres of land. Did he pay for it with wheat money? Not much. He held an auction of stock and in that way raised a lump sum for the first payment and—as near as I can recall—the deferred payments were met by the sale of cattle and hogs, not by wheat or small grain. During the Civil War he bought another adjoining forty acres of land. He traded in a bunch of cattle for the first payment and later again had recourse to an auction sale of cattle to meet the deferred payment. That time, receiving "war prices", he did pretty well. It was stock and not wheat which paid for the land.

All this time he was raising wheat as his main crop. Wheat, it is true, came in handy to take to the near-by water-propelled toll grist mill to have ground into flour for the family, bran for the milk cows, shorts and middlings for "slopping" the hogs. Once a year, a few loads of wheat were hauled over the twenty-five miles of hilly, stony, poor roads to market and sold for cash, but it brought barely enough to meet the "store bills" for the year.

The sheep furnished the wool that mother spun and wove into cloth out of which she made a large share of the clothing for the family. The sheep also furnished mutton for the family during summer. The butter and eggs were carried to the country "Cash and Barter" store and exchanged for groceries, "blue drillings," "hickory shirting," sheeting, and the other necessities, including some "ready made" clothing.

But in the early seventies when the pest of chinch bugs took the wheat, that way of farming came to an abrupt close and the farmers were forced to try some other way. They began by seeding down their fields with clover and soon began to specialize in dairying, more particularly in cheese making, in that part of the state.

That they have made a success of this I can vouch for, as they say, "by the evidence of my own eyes". As we drove through that part of Wisconsin recently on an auto trip, we were both surprised and pleased with the evidences of prosperity on every hand in that dairy and cheese country.

The writer pulled out from that part of the country in the early seventies. At that time it was generally conceded that those who pulled out showed good judgment, but from the present prosperity of that part of the country I have begun to doubt if we who left during the chinch bug scare were any " smarter" than those who remained and went into dairying and cheese making. More than that, they now have good graded and graveled roads so well numbered and marked that every wayfarer traveling over them feels thankful and is willing to concede that they have "the best road system in the country".

As an additional evidence of the confidence one places in the stock and dairy business, I can say that during the forty and more years during which I was engaged in the retail business and did a general credit business, we guaged the amount of credit extended to our farmer customers largely on the amount of stock they had. The one crop farmer was always, relatively, a poorer risk.

For the last twenty-five years I have been directly interested in farming and dairying. During that time what profits we had realized have come from dairying and hogs, not from small grain. The grain has been fed up on the place.

As still further evidence of the success of dairying and diversified farming as I have known it, as compared with other vocations, I will say this: We hear much about the high prices charged by plasterers, carpenters, mason, blacksmiths, and mechanics of all kinds, but I know of very few of that class of workmen who have retired on a competence, while I do know of many who have made dairying and mixed farming their life work who have brought up families, educated their children, and then retired on a competence.

My experience has been, mainly, in the small town and in the farming communities, still it may be as well to ponder over these things and not be enticed away from the farm by the higher wages and glare of the city.

But, as I said at the start, these things are all so self-evident as scarcely worth mentioning, if it were not for the fact that experience shows that many of the most important truths need to be told and retold over and over again.

Iowa. ED. HENDERSON.

Neighborhood Butchering

HOARD'S DAIRYMAN:—For a number of years from six to eight Montrose township neighbors in Lee County, Iowa, have done their butchering together. They bring their hogs to a central place, usually the farm that has the smoke house. One brings wood, others get the water, another rigs up a scaffold to hang the carcasses on, and everyone works.

The women come, too, and they have a big dinner ready for the men. It is a neighborhood affair which has become established.

As soon as the water in the big iron kettle boils everything is ready and the butchering commences. Since an extension man from the state college showed them how to kill their hogs by sticking, the old method of stunning has been abandoned. The hogs are stuck and scalded, thrown on a heavy gate raised on saw horses and scraped. As soon as one is out of the water another is ready for the scalding and things are kept moving. The hogs are hung up and cleaned and everyone is busy until the last hog is cleaned.

The following day the carcasses are taken down to be worked up. The hams, shoulders, and sides are trimmed and the trimmings and fat worked up into sausage or lard. Some of the meat is taken home to be used fresh and the other is marked and salted down in barrels to season. After the cure the meat is smoked over a hickory fire and there is country cured pork in every farm house to last well into the summer.

Iowa. A. M. WETTACH.

Plowing Contest

HOARD'S DAIRYMAN:—The famous 11th Annual Taylor County Plowing Match will be held this year at Jump River, Wis., on Sept. 23, on Wm. Brunschmid's farm. The village of Jump River is reached by Soo Railway or State Highway No. 73, or County Trunk Highway D. The grand feature of the whole program is the plowing match—12 to 20 teams with various makes of walking and riding plows contesting in their ability to turn the furrow just right.

Plowing is an art to which all farmers must give proper heed. The American farmer is equipped with efficient tools. And to achieve the greatest success in raising crops the soil must be properly turned over, broken, and refined. Plowing is the foundation of this work, therefore farmers should use this opportunity to good advantage. In addition to the plowing contest will be a demonstration of land clearing with Pyrotal, a team pulling contest, and other events.

WM. BRUNSCHMID, Sec.

LA NOCE'S MAY ROSE

The Atamannsit Guernsey herd, owned by George W. St. Amant, Massachusetts, has three cows that have just completed high records. One of them, La Noce's May Rose, has produced 18,119.9 pounds milk and 932.84 pounds fat, which makes her the world's champion Guernsey for her age at three and one-half years. This cow thus wins a coveted place that has been held for the last fourteen years by Dolly Dimple. Mr. St. Amant purchased her at the 1920 National Sale for much less than he had expected to have to pay for her. However, even though many breeders did not bid upon her that day, she proved his judgment correct.

Another cow that has just completed her record at Atamannsit Farm is Ultra of Edgemoor. She produced 13,493.6 pounds milk and 767.42 pounds fat, as a two-year-old, which gives her second place in her class. At the same time her half sister, Rose Queen of Edgemoor, has produced 13,130.9 pounds milk and 744.32 pounds fat, after dropping twin calves. She now holds sixth place in her class as a four-year-old.—AMERICAN GUERNSEY CATTLE CLUB.

Silage from Soft Ear Corn

There is lack of silo room in many places for the whole corn crop should it be frosted or immature. The ears are the most valuable part of the crop. These should be saved in any event. It is difficult to save the ears of a soft corn crop by storage in cribs. The Iowa Experiment Station in 1917 demonstrated that the soft ears in the late roasting stage could be husked, run through a silage cutter and tightly packed into silos with very good results. The silage resulting after twelve days of fermentation was of surprisingly good quality. The silage kept well, held its flavor, and at the end of two months was found to be in excellent feeding condition. Silage can be made in ten or twelve days and it is probable that it will be ready to feed two weeks after filling.

It is not necessary to husk the corn in order to make soft ear silage. Snapped corn can be handled just as satisfactorily as the husked corn and the husks give the advantage of greater bulk and additional feed.

The Iowa station urges chopping the corn finely in making ear corn silage and packing it tightly in the silo by tramping, especially near the walls. Silage made from ears that are partially matured may require the addition of water to insure proper packing and prevent overheating and molding in the silage-making process. Silage made from ear corn should be covered with a layer of finely cut corn fodder or stover. If such a cover is not provided there will be too much waste of valuable corn. It is not advisable to make silage of mature or nearly mature corn. The cobs prevent packing and they do not contain sufficient sugar to permit the fermentation which is necessary for preservation.

Ear corn silage should be fed as a concentrate, not as a roughage.—ANDREW BOSS, Minnesota College of Agriculture.

Trench Silos Practical

F. L. Cooper, of the Colorado College of Agriculture, says that trench silos are practical where the farmer needs a make-shift silo to take care of the forage that has been damaged by hail or drouth, and where there is neither time nor money to build a more permanent silo.

"Trench silos answer the purpose if properly constructed and properly filled," says Mr. Cooper. "Most of the complaint regarding their use comes from the fact that they are poorly built or that the silage is not well packed. Trench silos, in what we ordinarily call tight soil, stand up for a season or two but in the lighter soils the walls will not last unless they are plastered with cement. They can be quickly and easily built with the use of a scraper and should not be deeper than 8 or 10 feet. The walls must be made smooth with a spade. The length of the silo depends upon the amount of forage to be stored in it.

"The silage should be cut in the usual way and tightly packed, evenly tramped and covered with a layer of at least 8 inches of straw and 8 to 12 inches of earth on top of the straw."

Those interested in detailed plans may obtain same by writing to the Extension Service, College of Agriculture, Fort Collins, Colorado.

New Michigan Holstein Record

Michigan's new Holstein champion cow for ten months' production as a junior three-year-old is Traverse Duchess Korndyke, owned by the Detroit Creamery Company. Her record is 20,456.4 pounds milk containing 671.43 pounds butterfat, equivalent to 839.2 pounds butter, according to the Advanced Registry Department of the Holstein-Friesian Association of America—Extension Service Holstein-Friesian Ass'n. of America.

Be fair in all your dealings and aim for the highest.

Leaky Roofs

Made **Water-tight** for **10 Years**

An amazingly simple way to make your leaky roofs watertight for 10 years at one-fifth the cost of a new roof. 30 years use on industrial buildings all over the world proves what it will do for you.

SEAL-TITE

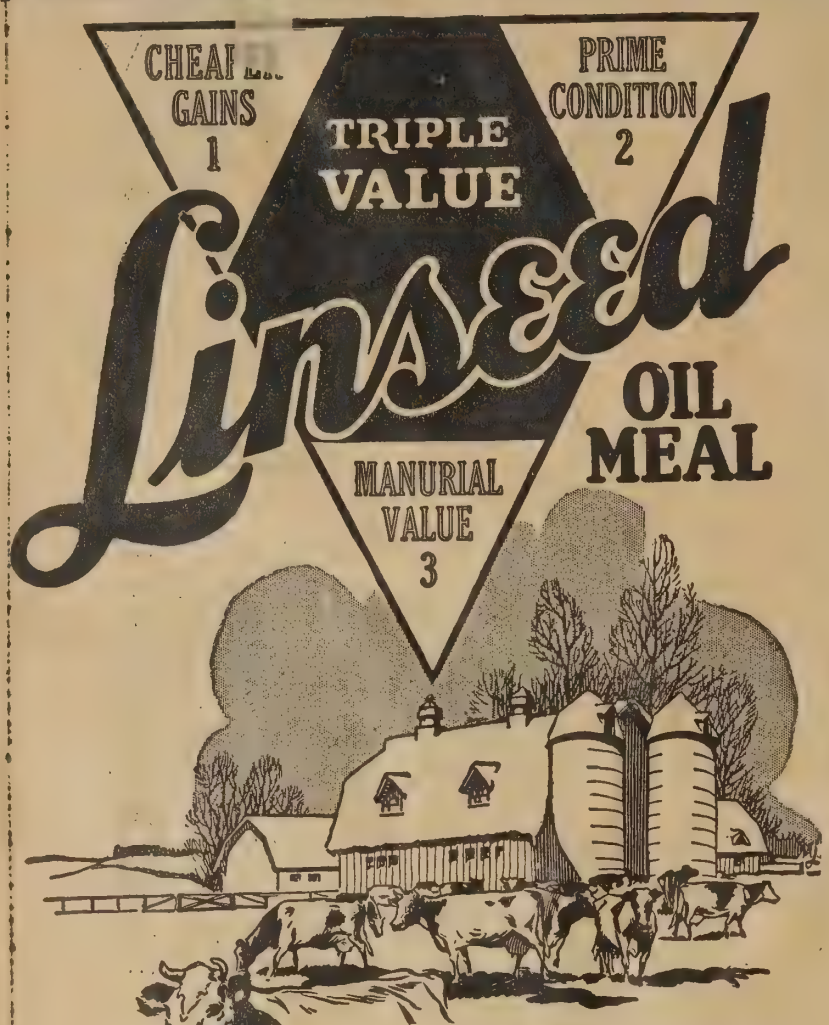
TRADE MARK THICK LIQUID REGISTERED

ASBESTOS ROOFING

You pour it on right over the old roof and spread it out with a roofer's brush. You do it yourself in a few hours—no labor cost—you end your roof worries for 10 years to come.

Don't Pay for 4 Months!

We ask no pay till 4 months of sun and rain have proved all our claims. SEAL-TITE must do what we say it will or it costs you nothing. Could you make a fairer offer if you wrote it yourself?



WRITE NOW!

Our big, illustrated circular tells all about how you can turn an old, leaky roof into a new, watertight roof, guaranteed for 10 years, at a small fraction of the cost of a new roof. What a wonderful chance to save! Don't wait for the next rain to remind you that your roofs leak. Look into this thing right now. Send today for full details of our amazing offer. Write TODAY!

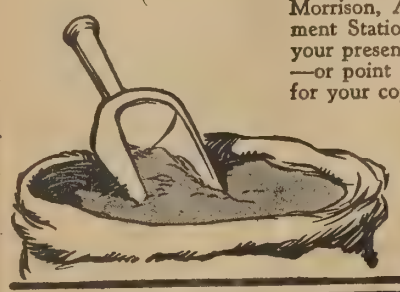
Balance the ration with



WHAT IT IS AND WHAT IT DOES

It pays large returns on the investment.
It is rich in protein.
It is a mild laxative, mucilaginous and soothing.
It is safe.
It is palatable.
It can be profitably fed to all farm animals.
It makes mellow hides and silky hair.
It is widely used for cows on test; lengthens lactation.
Extensively used for fitting animals for show.
It improves the thrift of animals.
It lessens the time needed to fatten stock.
It saves a large bulk of other feeds.
It is contained in nearly all good mixed feeds.
It is highly digestible.
It helps make other feeds more valuable.
It greatly increases the value of the manure.

"How to Make Money With Linseed Oil Meal"

A condensed and up-to-the-minute feeding guide—is yours for the asking. It is written by Prof. F. B. Morrison, Asst. Director of the Wisconsin Experiment Station. It will show you how you can make your present feeding system pay much greater profit—or point the way to new and better rations. Send for your copy now. Ask for booklet T-9.

Association Notes by Testers

Mesa Co., Colo.: A picnic and general meeting was held last month. For August producers received $2.90 for market milk, with the creameries paying 33c per lb. for fat. Milk retails for 10—12½c a quart and butter for 45c a pound.—C. H. Boyd.

Kane Co., No. 2, Ill.: The average production of the 528 cows tested in August was 25 lbs. fat. Production is declining, together with returns over feed cost, which increased the cost of production 33% over the previous month. Two herds received their first tuberculin test under Federal supervision, with a third of the cattle reacting. Two more herds are now signed up for test. In July, producers received $2.60 cwt. for market milk. Milk retails for 10—13c a quart and butter for 43—45c a pound.—W. K. Bullock.

McHenry Co., Ill.: Twenty-five of the 28 herds in the association have been tested for tuberculosis. Of the 9 accredited herds, 4 are found among the high herds nearly every month. In August producers received $2.60 a cwt. for market milk. Milk retails for 10—12c a quart, cheese for 46c a lb. and butter for 54c a lb.—Bruce McClellan.

Hancock Co. No. 1, Iowa: One barn has been whitewashed. Three members are weighing their milk. Adding a disk to one separator reduced the test of the skimmilk by .04%. The creamery paid 39—43c for fat in July. Milk retails for 10c a quart and butter for 40c a lb.—H. W. Tiggeman.

Northern-Central Berkshire, Mass.: All but two members are feeding grain on pasture. Guernseys are in demand at present. One member has stopped selling fluid milk and is making butter for retail. In July producers received $2.75 a cwt. for market milk.—Theodore H. Weed.

Barry No. 1, Mich.: Cows are shrinking in milk production. Several acres of alfalfa are being sown this month. In August producers received $1.55 a cwt. at the condensery, with the creameries paying 37—42c a lb. for fat. Milk retails for 10c a quart and butter for 40c a lb.—W. W. Preston.

Montcalm, Mich.: One member is erecting a silo. Several members are expecting to go to the National Dairy Show. In August producers received $2.50 a cwt. for milk, with the condensery paying $1.75. The creamery paid 37—40c a lb. for fat.—K. S. King.

South Eaton, Mich.: In July producers received $1.75 a cwt. for market milk, the creamery paying 38—45c a lb. for fat. Milk retails for 10—12c a quart.—Hans E. Kardel.

Tuscola No. 1, Mich.: Several herds tested for tuberculosis and only four reactors found. One member installed modern equipment and two members have built milk houses. Two unprofitable cows were sold. The association average for the first six months is 151.5 lbs. fat per cow. Producers received $1.60 a cwt. for market milk, with the condensery paying $1.50 a cwt. and the creamery 39c a lb. for fat.—Eldon R. Bruce.

Cannon Valley, Minn.: In July producers received $1.85 a cwt. for market milk. The cheese factory paid 45c a lb. for fat and the creamery 43c. Market milk retails for 10c a quart.—Glenn H. Boldt.

Martin Co. No. 2, Minn.: The only herds holding up in milk production are those fed grain. The three testers in this county are planning on having an exhibit at the county fair. In July the creamery paid 42c a lb. for fat.—Harry A. Anderson.

West Dakota Co., Minn.: For the first time the number of cows tested dropped below 400 and the average per cow to less than 25 lbs. fat. In July producers received $1.85 a cwt. for market milk. Milk retails for 10—11c a quart and butter for 40c a lb.—Lee L. Hammond.

Greene Co., Mo.: Of the 364 cows on test, 5 produced over 50 lbs. fat, the average of all cows being 23 lbs. Nearly all members have an abundance of good legume hay this year and a bumper corn crop. We have four new members. In July producers received $2.50 a cwt. for market milk.—V. L. Gregg.

Jasper—Newton, Mo.: In July the creamery paid 28—32c a lb. for fat. Milk retails for 10c a quart.—B. F. Schaefer.

Day Co., S. Dak.: One barn remodeled and modern equipment installed. The grain yields are the largest for some years. In August producers received $2.00 a cwt. for market milk. Milk retails for 8c a quart and butter for 35c a lb.—E. M. Duryee.

Sioux Falls, S. Dak.: One new silo erected and one barn remodeled and equipped with a ventilating system and individual drinking cups. One new milking machine brings the total to nine now being used. In August producers received $1.75—2.25 cwt. for milk. The creamery paid 31c a lb. for fat. Milk retails for 12c a quart, cheese 25c a lb. and butter 34c.—Calvin E. Heeren.

Richmond—Lewiston, Utah: Pastures are very dry, causing most members to feed alfalfa and a few beet molasses with a little grain. More of our dairymen should dairy every day instead of one or two weeks a month.—LeRoi Nelson.

Wellsville—College Ward, Utah: Two registered Holstein bulls were purchased and six unprofitable cows sold. In August the condensery paid 44c a lb. for fat. Cheese retails for 30c a lb. and butter 45c.—Reuben Hansen.

Connecticut Valley, Vt.: The association enters its second year with four new members. The average

price of fat was 43c a lb. with an average cost of grain of $47 a ton. Milk retails for 10c a quart.—Edw. T. Leavitt.

Bloomer No. 1, Wis.: Several herds tested for tuberculosis, with reactors found in two herds. In July the condensery paid 44c a lb. for fat and the cheese factory 38c.—Charles Wirth.

Cedarburg—Grafton, Wis.: Thirteen herds tested for tuberculosis with 5 reactors. The association now has 8 accredited herds. In August producers received $2.18 a cwt. for market milk. Cheese factory paid 43c a lb. for fat and the condensery 45c.—Gust Wild.

Coon Valley, Wis.: Grain is turning out fairly good. Two members are installing modern barn equipment. The association had a picnic. the main attraction being a ball game in which the Holstein breeders beat the Guernsey breeders. In August the creamery paid 43c a lb. for fat—W. H. Klahn.

Eau Claire No. 1, Wis.: In July the condensery paid 45c a lb. for fat, the cheese factory 46c, and the creamery 42c. Milk retails for 10c a quart and butter for 40c a lb.—Wm. Griffin.

Farmington, Wis.: All herds are under federal supervision for tuberculosis. In August the condensery paid 47c a lb. for fat, the creamery 47c and the cheese factory 45c. Cheese retails for 20c a lb.—J. G. Strathearn.

Fountain City, Wis: Three more members have put up their first silos. One member has installed new stanchions and another has installed ventilation and improved his milk house.—Orrin A. Haensen.

Independence, Wis.: Three cows produced over 60 lbs. of fat during August on a feed of 4 to 5 lbs. of a mixture of equal parts of oats, barley, and bran. The association and calf club made a good showing at the county fair, securing premiums on every animal shown. Most of the cattle were taken from pasture, clipped, and sent to the fair, where they competed against fitted cattle from three counties. We consider we have the real stuff or we would have been left out entirely.—Peter Nelson.

Lancaster, Wis.: Of the 409 cows tested, 43 made over 40 lbs. fat. Three cows were sold for dairy purposes and three were killed by lightning. Farmers are out of grain and have quit feeding, due to high price. Those that bought grain and fed their cows received a larger profit per cow than those who did not feed grain.—Albert J. Claudal.

Milton—Edgerton, Wis.: In August the condensery paid $1.66 a cwt. for milk and the creamery paid 40 cents a lb. for fat.—Warren H. Roberts.

Rewey, Wis.: In August the cheese factory paid $1.58 a cwt. for milk and the creamery 38.5 cents a lb. for fat. Milk retails for 10 cents a quart, cheese for 32 cents a lb. and butter for 45 cents a lb.—Harry Robinson.

Saukville, Wis.: In August the condensery paid 58 cents a lb. for fat and the cheese factory and creamery 42 cents a lb. Milk retails for 10 cents a quart.—Nick Schocksmitt.

Alma—Cochrane, Wis.: The second annual report is now ready for distribution. One milk house was built and one barn was remodeled. Boarder cows are getting scarce. In August the creamery paid 45c a lb. for fat.—E. P. Bailey.

Spring Green, Wis.: The Progressive Calf Club, started by the tester last February, finished its work by winning first prize at the county fair. Miss Mildred Kever won $15 with her Guernsey calf, as also $10 at the local fair. Out of two calves taken to the Mineral Point fair, both stood far above other calves there in excellence of type and fitting condition. Next year we will give chances only to boys and girls between 11 and 18 years of age with pure-bred calves.—V. H. Dani.

Tennyson—Dickeyville, Wis.: Forty-three out of 360 cows tested produced over 40 lbs. of fat. In August the cheese factory paid 37 cents a lb. for fat and the creamery 38—40 cents a lb.—Joe Aufdermauer.

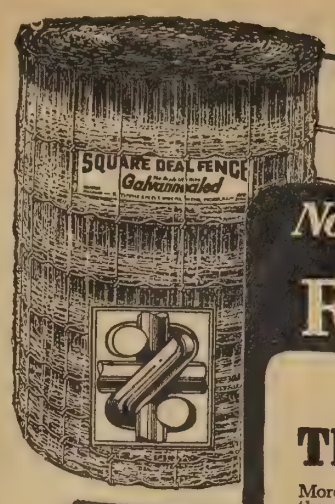
Westby Jersey, Wis.: Two new separators were bought and others repaired. The shortage of pasture has brought on more grain feeding. Two herds have passed a clean tuberculin test. In July the creamery paid 44c a lb. for fat and milk retailed at 10c a quart.—Harry Oehmcke.

Edgar, Wis.: In July the cheese factory paid 42c a lb. for fat and the creamery 43c.—E. L. Nordgren.

Proven Ration of Central Wisconsin

HOARD'S DAIRYMAN:—The cows of the Greenwood, Wis., Cow Testing Association have been doing exceptionally well this year. Herd averages of forty pounds are not unusual. A grade Holstein herd of eleven cows in the month of March made an average of 60 lbs. fat. The Association finished the month of February with 67 forty-pound cows. In March it will report over 100 forty-pound cows.

Clark County, with Greenwood in the heart of it, is a comparatively new dairy country, but it boasts 13 cow testing associations, more than any other county in the world. The feeds fed in the association are largely clover hay, corn silage, oats, corn, and oil meal. Previously a great deal of bran has been fed. This year we have with good results fed oats and corn and oil meal, with our clover or mixed hay and corn silage. The cost of our feed bill has thus been reduced, allowing a greater margin of profit over the cost of feeds. In addition to this our cows are coming out of the period of heavy feeding, coupled with heavy production, in better condition, better fit to continue their high production on the summer pasture. Bran has been used for cows springing, feeding it in the form of a bran mash just before and just after freshening; and, too, to change or vary the ration for a short period of time. Bran stimulates the milk flow but we find it is hard on the condition of the cow. We advise it only where we have excellent corn silage or with a bigger percentage of corn in the grain mixture. Even then we use oil meal in the ration as a cheaper source of protein.



We are looking forward to next winter when we expect to give alfalfa a real try in Clark County and in the Greenwood Association. Over 600 acres of alfalfa is to be planted in Clark County this spring. Soy bean hay and soy bean meal raised on our farms have been fed in our association but only to a limited extent. Soy beans both for hay and soy bean meal will be increased this summer.

INGVALD O. HEMBRE, Tester.

The latest Jersey to break a Michigan record is Oxford Daisy's Keepsake. Starting on test at three years and five months of age this cow produced 725.69 pounds fat and 13,540 pounds milk in 365 days. Calf was carried for 206 days of the test.

On this record Keepsake wins a gold medal and a silver medal and becomes junior three-year-old Jersey fat champion of Michigan.

The new champion is owned and was bred and tested by Mr. H. F. Probert.—The American Jersey Cattle Club.

These Three FREE

Send for Ropp's Calculator, a valuable farm book FREE with Square Deal catalog and "Official Proof of Tests" that shows and tells how we make "Galvannealed" wire last 2 to 3 times longer at no higher price than plain galvanized fence. All 3 free to land owners. A postal will do.

NOTICE!!

Square Deal Fence, famous for many years, is now made only by our patented "Galvannealed" process that puts on 2 to 3 times more zinc protection and sold at no extra price. Always look for the Red Strand.

Now Square Deal Fence is marked with a Red Strand

The Fence That Railroads Buy!

More "Galvannealed" Square Deal Fence has been sold to the railroads the past year than ever before—BECAUSE—railroads buy by test. "Galvannealed" is Guaranteed to have more zinc coating than any other farm fence.

Railroads know that this copper-bearing "Galvannealed" Square Deal Fence won't have to be replaced for many, many years. They know this new process masters rust.

The Triple Life Wire Galvannealed Square Deal Fence

NO EXTRA PRICE

has been proven by Indiana State University; nationally known testing laboratories, railroads and other authorities everywhere to have 2 to 3 times more zinc coating than ordinary farm fence. (Copies of official tests will be sent upon request.)

In addition to the thick outer coating of zinc that prevents rust, the copper-bearing open hearth steel wire also lasts many years longer than steel without copper. And, best of all, it costs not one cent more than ordinary galvanized wire. In fact, Square Deal fence costs less than half as much when you figure how many years longer it lasts.

Square Deal "Galvannealed" fence also gives you—full gauge line and stay wires; the famous Square Deal Knot that cannot slip; stiff, one piece stay wires that act like pickets—keep the fence straight and trim and make fewer posts necessary and well crimped springy line wires that expand and contract with the seasons. Finest farms are being fenced with "Galvannealed."

Always look for the Red Strand—it means a farm fence that will outlast any other and—it costs no more.

THE INDIANA STATE FAIR

C. T. CONKLIN, OHIO

HELEN KYLE OF INDIANA

Winner of first place in American class in poultry club show at Indiana State Fair. She set 50 eggs and raised 47 chickens.

THE dedication of the handsome new cattle barn at the Indiana State Fair was fittingly accomplished with an exhibition of some 500 head of dairy cattle. Holsteins, Guernseys, and Jerseys were about even in numbers; Ayrshires were light and no Brown Swiss classification was provided. Very few state fair grounds can boast of a better cattle barn than the new structure at Indianapolis. It is of brick and steel construction and will comfortably care for an exhibit of from 1,800 to 2,000 head of cattle. The roof is unusually high, which provides excellent ventilation; the aisles are wide; a feed alley between the rows of cattle allows sufficient storage space, and above all the building is light and airy.

Dairy Exhibits

What can be done to bring the dairy industry of a state before the people was well demonstrated at the Indiana State Fair held at Indianapolis, September 1st to the 5th.

The dairy exhibits were entirely educational and were made possible by the companies engaged in the manufacture and distribution of dairy products in the state co-operating with the dairy and extension departments of Purdue University. The dairy exhibits, this year, were in the excellent Purdue Building, just recently finished, which the State Board of Agriculture has so generously provided for the use of the University for their state fair exhibits. The dairy exhibits were probably the most outstanding exhibits on the fair grounds.

It is needless to say that this exhibit attracted a great deal of attention, and many of the visitors at the state fair saw these exhibits, stopped to read the illustrated material just above the large glass windows, which gave some outstanding facts regarding Indiana's dairy industry, as well as facts relating to the importance of consuming more milk and its products. The other part of the dairy exhibit was an exhibit of eight Indiana milch cows, taken from Indiana cow testing associations. The profit over feed cost of one of these cows was equal to the combined profit of the other seven. This fact was brought out by means of charts and figures, and a great lesson in breeding and feeding of dairy cows was taken home by all who viewed this exhibit.

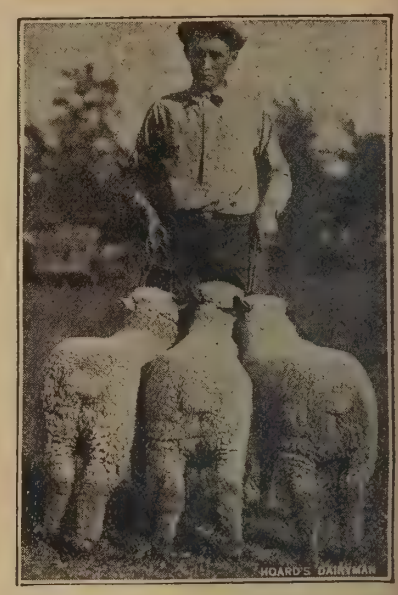
AYRSHIRE CALF CLUB SHOW AT INDIANA STATE FAIR

Holsteins

The Holstein show was almost exclusively an Indiana proposition with excellent herds from H. A. Brace of Wisconsin, F. O. Larson of Iowa, and the Du Page County, Illinois, exhibit. The first prize aged bull, Duke Ormsby Aaggie Canary, was exhibited by Charles Weidler of Indiana. Although a winner of the senior championship, the grand champion honors went to the sensational six-month-old calf, General Homestead Mercedes, shown by H. Brace & Sons of Wisconsin. Although a junior calf is not generally a popular champion, this case was an exception and the ringside quite generally agreed that the combination of quality, character, and capacity entitled this youngster to the purple. F. O. Larson of Iowa showed the winning two-year-old and yearling bulls.

B. S. & S. H. Dragoo of Indiana won the aged cow class on the well balanced Pauline Netherland Vashti 2nd. The three-year-old class was topped by Corwin Colantha Florence Ormsby, the well-known winner of the two-year-old class at the 1923 National, and now owned by Dragoos. Although hardly in show condition, this good heifer with her great scale, squarely attached udder of excellent texture, and good type, could not be denied the grand champion honors.

The winning two-year-old was brought out by Du Page County, while the junior champion was a daughter of the second prize aged cow, both shown by Charles Weidler of Indiana. F. O. Larson won three blues in the junior yearling and two heifer calf classes. J. C. Cort of Wisconsin tied the ribbons in a very satisfactory manner.



Jerseys

Excellent quality prevailed with the tops of the Jersey show. Indiana breeders were out in force, together with the Pebble Hill Plantation, R. C. Tway, and Camden Terrace from outside the state.

The aged bull class was won by the sensational Adelina's Sultan from the Pebble Hill herd, that went on through to the senior and grand champion honors. The junior champion was a very typy, straight-lined yearling from the Scranton & Dugle herd.

The aged cows were topped by Fern's Oxford Anemone from the Pebble Hill herd. Championship honors were hers by virtue of her desirable type, character, and shapely udder. The junior champion was the big, strong senior yearling heifer from the Camden Terrace exhibit.

Scranton & Dugle had the edge on their Indiana competitors by winning several of the open classes as well as young herd, get of sire, and produce of dam. The awards were made by Professor L. H. Fairchild of Purdue University.

ROBERT NASH OF INDIANA AND HIS GRAND CHAMPION LAMBS IN THE CLUB CLASS

Guernseys

The best show of Guernseys in the annals of the Indiana Fair was staged by the Indiana breeders together with the Gayoso herd of Mississippi, the Sweets Springs herd from Ohio, and the Waukesha County, Wisconsin, herd.

The aged bull class was won by the thinly fleshed but impressive Proud Prince of Edgemoor, shown by Edward T. Williams of Wisconsin. The winning two-year-old was from the same exhibit, shown in the name of

MICHIGAN'S THREE-QUARTER CENTURY FAIR

IT was with a sense of reverence that we walked across that splash of green set down there in the heart of Detroit, Uncle Sam's fourth largest city. For this spot was the scene of the first state fair held west of the Alleghanies just three-quarters of a century previous. At that time this place was on the outskirts of a small but thriving village. But what a change! In place of open country, huge skyscrapers loom up toward the heavens on every side. The horses and lumbering ox teams are gone and almost forgotten by the scrambling, scurrying mobs that weave their perilous way through the throbbing traffic of impatient horseless carriages and street cars. It was as though a great paint bucket in the sky had carelessly splashed a drop of green paint over the sides and they called it Grand Circus Park.

Can you picture that first state fair?

"Michigan's pioneers gathered the choicest of their crops and herds and brought them to a place just outside of Detroit," says G. W. Dickinson, for the past 12 years secretary-manager of the Michigan State Fair. "There under the patronage of the governor of the state and other men were held plowing contests. The first farm machinery, designed to raise American agriculture above the level of mere physical exertion, showed what it could do.

First Fair Financial Success

"This first fair was self supporting. The receipts were $3,700. Its initial success made it a permanent institution. In the years that followed it travelled about the state until 1905 when it settled on the present site of 167 acres, again on the outskirts of Detroit but this time some eight miles from the original fair grounds."

It is interesting to know that the fair was founded by the same men who founded Michigan Agricultural College, said to be the first of its kind in the world. Thus the Michigan State Fair was an outgrowth of an educational enterprise.

As has grown the city, so has grown agricultural and industrial Michigan, and so has grown the mirror of her commonwealth, the state fair. And at the entrance to her magnificent fair grounds we were greeted by these words, "Michigan State Fair, Still Growing". We entered, we saw, and we believed. From the attendance standpoint alone this statement had deep significance. Those who watched the plowing matches in 1849 were a mere handful compared to the more than 400,000 visitors who crowded through the gates between August 29 and September 7, 1924.

In keeping with the observance of the diamond wedding anniversary of the fair to the growth and prosperity of the state, a number of honor guests were entertained by the management. One of those so honored was Mrs. Florence Babbitt who attended the state fair held in Ann Arbor 70 years ago. G. A. R. veterans, likewise honored guests, found especial delight in an exhibit entitled "Lest We Forget", showing some seventeen different types of vehicles in use during the past century.

Fair Had Good Balance

The 1924 Michigan State Fair was preeminently a well balanced exposition. Every one of the 24 departments was well managed and made a most excellent impression upon the visitors. The lay-out being followed in developing the grounds gives due consideration to appearance and convenience and is very pleasing. A definite form of architecture has been adopted in constructing the most modern of buildings. As finances allow and growth makes necessary, new structures are going up on the grounds.

We hesitate to say which was the outstanding feature of the fair, they were all so uniformly good. With the words of the secretary-manager, however, "our live stock exhibits are the best we have ever had", we too will agree. In numbers these exhibits exceeded 3,600 entries, the quality of which was very good indeed. Dairy cattle, horses, beef cattle, sheep, and hogs filled the barns and kept the judges busy. We would not overlook the women's department where exhibits of antiques and needlework and the better babies' contest featured, nor the many educational offerings of the entire fair. The grain, forage crop, and horticultural exhibits occupied their rightful place. The state agricultural department held sway under the grandstand and told the visitors a very good story of the work being done throughout the state by them.

Michigan's Future Farmers Compete

Michigan juniors gathered for fun and combat in the boys' and girls' club department, R. A. Turner, for several years past state club leader, superintendent. In the dairy building you could see their good club work demonstrations, and the exhibits of their handiwork. In the barns and show ring you could see more than 300 head of live stock which they had diligently and painstakingly cared for during the past year. Forty-two boys competed for honors in the dairy cattle judging contest and many participated in the general live stock judging contest. A milking contest for boys, one for girls, and a grand championship contest aroused much excitement and keen, clean rivalry.

Fine Dairy Cattle Show

In total numbers, the dairy cattle exhibits crawled a few ahead of last year. In quality the show was beyond reproach. According to Superintendent A. E. Stevenson the large number of Ayrshires entered was one of the features. Judging took place on Tuesday, Wednesday, and part of Thursday, with Wednesday as the heaviest day. Part of the time four breeds were being judged.

Out-of-state exhibitors took a large share of the blue ribbons. However, Michigan was well represented in the total prize money. In some cases winners of the purple at previous showings were nosed out of these honors. A summary of the number of exhibitors and the number of entries in the different breeds may be of interest to you so is given here:

Breed	No. entries	No. exhibitors
Holstein	157	14
Ayrshire	140	5
Jerseys	129	10
Guernseys	89	8
Brown Swiss	57	6

In the Holstein division it is notable that Hargrove & Arnold in their first appearance at the Michigan fair copped a large number of the blue ribbons. Baynewood Daisy, last year's grand champion Holstein female, was forced to bow to Dorothy Ormsby Piebe. Count Veeman Segis Piebe, 1923 grand champion bull, won first in his class but yielded the purple to Randolph's Whitehurst Colantha Artis Lad.

There were very strong classes among the Jerseys. Three herds stood out above the rest: The Oaklands, Michigan; Elm Hill Farm, Massachusetts; and Rockclyffe Farm, New York. In the Ayrshire division Seitz of Wisconsin was a heavy winner with Shuttleworth Brothers, Michigan, second. Rueping had things pretty much his own way so far as blue and purple ribbons were concerned with the Guernseys, but the Larsen Canning Co., another Wisconsin breeder, sneaked off with a few of them. As for Brown Swiss, Marshall, Michigan; and Hull Bros., of Ohio, were the heaviest winners. A brief summary of the chief blue and purple ribbons may help you:

Exhibitor	Breed	Blues	Purples
Hargrove & Arnold	H	10	4
F. J. Rueping	G	14	5
Elm Hill Farm	J	9	4
The Oaklands	J	6	
Adam Seitz & Sons	A	14	5
L. S. Marshall & Sons	BS	11	4
Hull Bros.	BS	6	2

The blue ribbons were awarded as follows:

Holsteins

Judge: L. V. Wilson, Minnesota.

Bull 3 years old or over—Lambert & Webber, Michigan, on Count Veeman Segis Piebe. Bull 2 years old—A. F. Randolph, Illinois, on Whitehurst Colantha Artis Lad. Senior yearling bull—Hargrove & Arnold, Iowa, on Triune Ormsby Piebe 27th. Junior yearling bull—Hargrove & Arnold on King Piebe 19th. Senior bull calf—E. M. Bayne, Michigan, on King Pontiac Segis Lad De Kol 13th. Junior bull calf—Detroit Creamery Farms on Velvet Pietertje Ormsby De Kol.

Senior and grand champion bull—Whitehurst Colantha Artis Lad. Junior champion bull—Triune Ormsby Piebe 27th.

Cow 4 years old or over—E. M. Bayne on Baynewood Daisy. Cow 3 years old—Hargrove & Arnold on Dorothy Ormsby Piebe. Two-year-old heifer in milk—R. E. Ansted, Ohio, on Monclova Prilly Lucile De Kol. Senior yearling heifer—Hargrove & Arnold on Pietertje Ormsby Piebe Mercedes. Junior yearling heifer—Hargrove & Arnold on Miss De Kol Piebe. Senior heifer calf—Hargrove & Arnold on Triune Piebe Fobes. Junior heifer calf—A. B. Black & Sons, Michigan, on Ardenteenie Dolly.

Senior and grand champion cow—Dorothy Ormsby Piebe. Junior champion—Triune Piebe Fobes.

Exhibitor's herd—R. E. Ansted. Breeder's herd—Hargrove & Arnold. Calf herd, get of sire on get of Triune Ormsby Piebe. Produce of cow on produce of Miss Piebe Fobes, all by Hargrove & Arnold.

Cow 4 years old or over with A. R. O. record above 20 lbs. butterfat in 7 days—John C. Buth, Michigan, on Starlight Veeman Hengerveld. Cow under 4 years with A. R. O. record above 16 lbs. butterfat in 7 days—J. B. Jones, Michigan, on M. B. B. Della. Cow 4 years old or over with A. R. O. record for 305 days or more—E. M. Bayne on Baynewood Daisy.

Guernseys

Judge: John S. Clark, Massachusetts.

Bull 3 years old or over—F. J. Rueping, Wisconsin, on Corium Princess Carrie's Champion. Bull 2 years old—F. J. Rueping on Corium Rose Des Houard's Superb. Senior yearling bull—Larsen Canning Co., Wisconsin, on Rose's Boy of Fern-Dell. Junior yearling bull—F. J. Rueping on Corium Cherub's Edgar. Senior bull calf—F. J. Rueping on Corium Snowdrop's Eric. Junior bull calf—F. J. Rueping on Corium Ladock Prince's Forest.

Senior and grand champion bull—Corium Princess Carrie's Champion. Junior champion—Rose's Boy of Fern-Dell.

Cow 4 years old or over—F. J. Rueping on Polly of Hillsdale. Cow 3 years old—Rueping on Floridale Merry Maid. Heifer 2 years old—Larsen Canning Co. on Bloom Farm Merry Christmas. Senior yearling heifer—Rueping on Gay Girl's Rosamond. Junior yearling heifer—Rueping on Corium Cherub's Dolla's Erma. Senior heifer calf—Larsen Canning Co. on Danny's Maid of Fern-Dell. Junior heifer calf—Portfleet Bros., Michigan, on Bob's Lassie of Greenleaf.

Senior and grand champion cow—Polly of Hillsdale. Junior champion—Gay Girl's Rosamond.

Exhibitor's herd and breeder's herd won by F. J. Rueping. Calf herd—William Larsen Canning Co. Get of sire—Rueping on get of Superb of Edgemoor. Produce of cow—Rueping on produce of Nancy's Golden Snowdrop. Dairy herd—Rueping. Cow 3 years old with A. R. record of 500 lbs. butterfat or over in 365 days—Rueping on Polly of Hillsdale.

Jerseys

Judge: W. W. Yapp, Illinois.

Bull 3 years old or over—Elm Hill Farm, Lee Boyce, Massachusetts on Raleigh's Farmer's Joy. Bull 2 years old—The Oaklands, Michigan, on Blond's Xenia Sultan. Senior yearling bull—Brennan, Fitzgerald & Sinks' Jersey Farm, Michigan, on Goldie's Raleigh. Junior yearling bull—Elm Hill Farm on Xenia's Cowslip Oxford. Senior bull calf—The Oaklands on Oxford Sultan's Imperator. Junior bull calf—A. P. Edison, Michigan, on unnamed entry.

Senior and grand champion bull—Raleigh's Farmer's Joy. Junior champion—Xenia's Cowslip's Oxford.

Cow 4 years old or over—Elm Hill Farm on Queen Plymouth of Lehigh. Cow 3 years old—Rockclyffe Farms, S. Kaplin, New York, on Toffee. Heifer 2 years old—Elm Hill Farm on Spy Girl's Surprise. Senior yearling heifer—Elm Hill Farm on Xenia's Peggy Rosemary. Junior yearling—Elm Hill Farm on Xenia's Dandy Actress. Senior heifer calf—Rockclyffe Farm on Eagle's Grey's Gloria. Junior heifer calf—Elm Hill Farm on Royal Lunas Light.

Senior and grand champion cow—Toffee. Junior champion—Xenia's Dandy Actress.

Exhibitor's herd—Elm Hill Farm. Breeder's herd—The Oaklands. Calf herd—The Oaklands. Get of sire—Elm Hill Farm on get of Xenia's Sultan. Produce of cow—The Oaklands on produce of Brampton Prairie Bessy. Dairy herd—Elm Hill Farm. Cow 3 years old or over with R. O. M. record of 500 lbs. butterfat or over in 365 days—The Oaklands on Brampton Morna Primrose.

Brown Swiss

Judge: O. E. Reed, Michigan.

Bull 3 years old or over—L. S. Marshall & Sons, Michigan, on Prince of Meadow Green. Bull 2 years old—Marshall on Buster Brown of Osseo. Senior yearling bull—Marshall on Usurla's Stasis. Junior yearling bull—The Hull Bros Co., Ohio, on Beaut of Lake View. Senior bull calf—Marshall on Styx Stasis 3rd. Junior bull calf—Hull Bros. on Dale of Lake View 5th.

Senior and grand champion bull—Prince of Meadow Green. Junior champion bull—Usurla's Stasis.

Cow 4 years old or over—Hull Bros. on Swiss Valley Girl 7th. Cow 3 years old or over—Hull Bros. on Nellie F. Beaut. Heifer 2 years old—Marshall on Fairview Styx M. Senior yearling heifer—Marshall on Stasis Rosalind. Junior yearling heifer—Hull Bros. on Militon Emma of Lake View. Senior heifer calf—Jubilee Farm, Illinois, on Jubilee Eldred Bankin. Junior heifer calf—Marshall on Beaut's 2nd Beauty.

Senior and grand champion female—Swiss Valley Girl 7th. Junior champion female—Stasis Rosalind.

Exhibitor's herd, breeder's herd, calf herd, and get of sire on get of Stasis Boy of Sedgely, all won by L. S. Marshall & Sons. Produce of cow—Hull Bros. on produce of Swiss Valley Girl.

Ayrshires

Judge: L. V. Wilson, Minnesota.

Bull 3 years old or over—Adam Seitz & Sons, Wisconsin, on Cavalier's Ping Pong. Bull 2 years old—Shuttleworth Bros., Michigan, on Pride's Boy. Senior yearling bull—Shuttleworth Bros. on Pride's Golden Harry. Junior yearling bull—Seitz on Cavalier's Golden Pippin. Senior bull calf—Shuttleworth Bros. on Norman. Junior bull calf—Seitz on Cavalier's Little Boy Blue.

Senior and grand champion bull—Cavalier's Ping Pong. Junior champion bull—Cavalier's Little Boy Blue.

Cow 4 years old or over—Seitz on South Farm Helen R. Cow 3 years old or over—Seitz on Cavalier's Kathleen. Heifer 2 years old—Seitz on Cavalier's Stuart Queen. Senior yearling heifer—Seitz on Cavalier's Silver Actress II. Junior yearling heifer—Seitz on Cavalier's Glen. Senior heifer calf—Seitz on S. C. Judy. Junior heifer calf—Shuttleworth Bros. on Belle's Gollen Laura.

Senior and grand champion female—South Farm Helen R. Junior champion—Cavalier's Glen.

Exhibitor's herd, breeder's herd, calf herd, get of sire on get of Hower's King of Hearts, and produce of cow on produce of Blackbyre's Lady Walker, all won by Adam Seitz & Sons.

Illustrations of the winners of grand championships will be published in our next week's issue.

Herd Prefix Names

Over 5,000 breeders of Holstein-Friesian cattle in the United States have now adopted prefix names, of which 645 were reserved in 1923. Such a name becomes a trade-mark for the owner, and whenever observed distinguishes the breeder. Another big advantage in a prefix is that it enables the breeder to use all Holstein names in new combinations and makes the selection of names less difficult.

The banyan trees of India are often capable of sheltering thousands of men. One of them in Ceylon throws a shadow at noon over four acres of ground.

Try one Kelly Commercial Cord on your car or truck

So far as we know, there never has been built another pneumatic tire with the wearing qualities of the Kelly Commercial Cord.

First developed to meet the need for a dependable truck tire, it gave such amazing service that people who were using it demanded it in passenger sizes, too.

It is now made in sizes from 30 x 3½ to 40 x 8 and in every size you will find the extra strong side-walls, the tough, massive tread and the reinforced shoulders that have placed the Commercial Cord in a class by itself.

Whether your driving is done over good roads or bad, if you want a sturdy, rugged tire that will outwear any tire you have ever used, try one Kelly Commercial Cord on our recommendation.

Kelly-Springfield Tire Co.

250 West 57th St. New York

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Favored Sweet Clover Sixty Years Ago

HOARD'S DAIRYMAN:—My father was a great admirer of Hoard's Dairyman and had he lived to read the last dozen copies he would have said, "Well, one of my dreams has come true. Hoard's Dairyman is at last advising the world the value of sweet clover." When you folks in the North called it a weed, he was saying what you say now. He ran a dairy in Bedford County, Virginia, over sixty years ago and made cheese, and clover was the cause of big flows of milk from Shorthorn cows.

We were shipping sweet clover seed in carload lots out of this country when half of the farmers in the corn belt were still calling it a weed. Our experience with it over a long period of time is that as a soil builder it has no equal and that every animal on the farm eats it with avidity. We have lost maybe one-half dozen cows, in thirty years, from bloat, and that would not have occurred had they not been put on it with empty bellies. I can assure you of a case where the cream check was cut from $250 per month to $50 by taking a herd out of sweet clover pasture.

Some people are already saying you are teaching cheap overproduction of milk and butter. It can't be done, if this wonderful U. S. A. will show the public world that milk is just as necessary for the building up of brain and brawn as the finest lubricants are for the finest autos, watches, and other machinery and that oleo and all other junk used as substitutes for milk and butter will gum up and wear out the human system as inferior oils do machinery. Milk in this country is worth nothing and the reason is all the hotels and eating joints in this country educate the people to eat what a first class hog would turn up his nose at if he could get prime milk and butter. You go in any town on the American continent and find a baby crying for milk up to five years old and its mother will fill it up with cheap sweets made sweet by coal tar derivatives, thereby ruining its digestive organs, causing extra doctor bills and medicine, and producing a weakling that will be a curse to the nation instead of a man or woman with magnificent physique.

The oleo fraternity profits by all this bovine tuberculosis propaganda. When veterinary surgeons are men of character who know their business and get well paid for it, you will see a change in business all around.

Alabama. T. O. MUNFORD.

Overproduction

HOARD'S DAIRYMAN:—During the World War period, demand was made for increased production. The patriotic spirit in the hearts of the American producers responded to the call and not a stone was left unturned. The farmers were the most patriotic of all on earth. They increased their force and broke up their last acre; worked 18 hours a day; paid the extreme high wages and then the drop came in the demand for their products, and they could not realize enough to cover the cost of production. When the spring of 1924 dawned upon them they reduced their forces to the minimum, seeded less acres, and what is the result? Demand for all they have, and then some. Never before, in my recollection, has such a demand come with largely increased prices while the products were still in the hands of the producer. Should this not be a lesson to every farmer?

Small acreage, well tilled, means increased profits. Large acreage, well tilled, means bankruptcy. It remains entirely with the farmer himself. No possible legislation can solve the problem. The little farm well tilled will do the work, and this method will bring many that are agriculturally inclined, worthy and well qualified, back to the beautiful country homes.

New York. P. B. CRANE.

Overproduction of Profit

HOARD'S DAIRYMAN:—Just thought I would throw a bouquet at the editor, and shy a brickbat at the fellows who talk overproduction. We like your paper fine, and think it is a good policy on your part to gather public opinion so we may know what the other fellow thinks. I believe facts are worth more to us as farmers than theories, so I will try to give a few in support of my opinion that there is "no such 'animal' as overproduction," quoting from Aug. 15th issue by Jas. H. Birchard.

I milk a few Jersey cows and last August I wanted some bran to feed so went to the mill and asked the price. The miller replied "$1.50". I asked what they paid for wheat and he said $1.25 per cwt. if it was first class. I went to the grocer and asked the price of potatoes. He supposed I had some to sell, so answered, "$2.50 per cwt." I said I wanted a few to eat, so he says, "Oh, 3 lbs. for a quarter." Now last year we had reported an overproduction of both wheat and potatoes.

Now this year we have reported a short crop of both wheat and potatoes. Let us see the effect. Last week I went to the mill for bran and it was $1.40 and I asked what they paid for wheat and they said $1.85 per cwt. I asked at the grocery what potatoes were worth and they said they paid $1.00 per cwt. They sold at $3.00 per cwt. Now just compare those prices. Last fall we sold our apples here at $18.00 to $20.00 a ton and when you bought apples shipped from here to Kansas or Oklahoma they were six to eight cents a pound and retailed in the stores in our own town at three pounds for a quarter. Overproduction was quoted to us all last year as the cause of the low price of apples. Now this year they tell us there is a shortage of apples all over, yet they offer 60 cents per bushel for apples right now. I sold hogs on foot for $3.00 per cwt. and bacon at the same time was 35 cents per pound in the slab.

All these wide ranges of prices are charged to overproduction, but it is overproduction of profits and not of foodstuff.

Colorado. J. A. DALY.

Congratulations

HOARD'S DAIRYMAN:—Hearty congratulations on your courage of publishing the article, "Dozen Reasons Against T. B. Testing". Many will silently thank you even though they do not write.

Please pass my thanks to the writer of the article, also.

Washington. M. R. COLBY.

WAYSIDE MUSINGS

Life—A Great Adventure

JOSEPH S. MORRIS, WISCONSIN

ISN'T it true that life is a great adventure? When you think it through you realize that you have to take most things and do most things in confidence that all will work out all right.

Man is by nature an inquisitive, exploring, pioneering, venturing being. Consider the child who rests today in the security and safety of parental care. Almost in the turning of a thought he will feel stirring within him the call to make adventure. There will come the eternal "Why" of things. Like all of his kind he will have to find an answer to the question stirring his mind.

There are mysteries in this world. I am—I feel within me the dawning of personality.

Whence came I? What is the beginning and the end of all this restless life?

I am surrounded by struggling, aspiring, and perspiring beings. What's it all about?

Compared to the world in which I live I am small indeed and yet I feel that I must do something with my life.

I look around me and see that some through mistakes make shipwreck of their lives. I wonder if I will have the power within me to make my life a success?

And even as we live and grow we must again and again make new adjustments to life, and make new ventures. Two things are requisite: Confidence in the Eternal Goodness that is everywhere in our world, and confidence in one's fellow beings.

We have to make the venture of getting an education in the confidence that men and women will not fool us but will put the facts we need to have within our reach.

We grow up in the confidence that our fathers and mothers will do right by us.

We make friends in the confidence that they will not prove false and hurt us.

We marry in the confidence that love will make it possible for a man and a woman to build a home and get along together.

We rear children in the confidence that if we do the best we know how and try to discover better counsel and advice to give them they will come to be good men and women.

We plant seed and cultivate in the hope that by and by we shall have a crop to reward us for our efforts.

Sometimes we are disappointed. Some things work out differently than we had expected. But, if all the while we have kept open minds and hearts and have not been rebellious we shall find life mellowing with age and we shall come to be that most wonderful of beings "the man or the woman with a contented heart".

And then will come, at the close of it all, what someone has called "the most beautiful adventure of all", when life goes down hill and into the sunset to find itself again at "Dawn" and get the answers to the soul's whisper of "evermore".

Ever Failing or Never Failing Pastures

(Continued from page 237)

plementary crops. The only expense is the seed and the labor of getting this worked into the ground, and liming the soil where it is necessary. If not pastured too close, particularly the first spring, sweet clover will reseed itself each year and remain in the pasture for several years. The seed can be worked into the bluegrass on very rough land if a little judgment and skill are used in doing it.

This means that at least three-fourths of all our tillable pasture land can be reinforced with sweet clover which will practically double the yield of the pasture.

Cow Testers' Conference

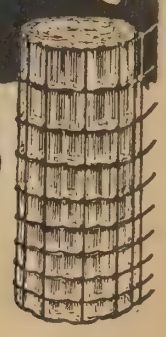
Under the leadership of A. J. Cramer, University of Wisconsin, cow testers will gather for a conference at the National Dairy Exposition which opens at Milwaukee, Wis., on Sept. 27. The aim of the conference, according to Mr. Cramer, will be to bring home to the farmers of the nation the need of testing work to determine whether the cow owner is getting full value from his animals. The farmers could increase their income fully 50 per cent without effort, according to Mr. Cramer.

"Weed out the scrub sire, elimate the boarder cow, adopt modern feeding methods, and join a cow testing association," he declares, "and watch the income increase. We propose to show the visitors to the national exposition how this is to be accomplished and what the remarkable results will be, if adopted."

Cow Demonstrations

Prof. M. N. Lawritson of the University of Nebraska, has been selected to take charge of the dairy cattle demonstrations at the National Dairy Exposition, which opens in Milwaukee on Sept. 27.

The cattle demonstrations will be continuous, and will be held in order to show farmers and dairymen how to tell the difference between profitable and nonprofitable animals. Increased production per cow and the elimination of boarder cows is sought through the teachings of the demonstrations. Judging by the farmers will be an adjunct to the cattle demonstrations.



Assisting the Nebraska professor at the exposition will be Prof. Hugh G. Van Pelt, Iowa; William Moscrip, Minnesota; R. S. Hulce, Wisconsin; C. S. Rhode, Illinois, and L. V. Wilson, Minnesota.

A Wisconsin Holstein Record

Wisconsin's new champion Holstein cow for ten months' production of butter as a junior two-year-old is M. B. B. Beauty, owned by Murphy Farms. Her record for this period is 17,598 pounds milk containing 624.25 pounds butterfat, equivalent to 780.3 pounds butter, according to the Advanced Registry Department of The Holstein-Friesian Association of America.—Extension Service, Holstein-Friesian Ass'n. of America.

Aunt Ada's Axioms: It always pays to take time to smile.

Super Zinc-ed WIRE FENCES

"Super-Zinced" means an *extra heavy and well bonded* coating of zinc applied to wire by our improved process. It marks the successful result of years of effort to produce better and more durable fences. "Super-Zinced" Fences have a rust-resisting armor that will not crack or peel, thus giving long and efficient service.

"Columbia" and "Pittsburgh Perfect" Super Zinc-ed Wire Fences

Our brands include the government approved farm and poultry styles in both hinge-joint and stiff-stay fences, also our very attractive lawn and flower fences. Inclosures made with our "Super-Zinced" fences are permanent improvements. They promote better and more profitable farming, protect crops and live stock, and add to the value of any farm. "Super-Zinced" fences are an investment in good farming.

Have a Nice Lawn

Our Lawn and Flower Fences contribute to the beauty of your lawn and effectively bar chickens and all farm animals. Made of heavy wires, "Super-Zinced" of course. Several attractive and distinctive designs.

FREE! To Farm Owners—This Useful Vest Pocket Book

Our "Super-Zinced" Wire Fences establish a new standard of fence service and durability. Remember that all of our fences are "Super-Zinced", armored against corrosion by the same high standard of rust protection. Yet so efficiently has our improved process been developed that we are able to sell our fences at *no increase in price* over fences of ordinary galvanizing quality. Be sure to send for "Super-Zinced" Fence Catalogue and Free Book. Use the Coupon below.

Pittsburgh Steel Co.

725 Union Trust Bldg. Pittsburgh, Pa.

Gentlemen: Please send FREE, the 72-page Farmer's Handy Manual of farm account pages, crop and live stock records, etc., also your "Super-Zinced" Fence Catalogue.

Embury SUPREME OIL LANTERNS

You cannot go wrong with an Embury. There is no other lantern anywhere that gives you so much for the money—more light, more convenience, better and longer service, at the same cost as ordinary lanterns.

Don't take our word for it, but compare the Embury with any other lantern and judge for yourself.

No. 160 for $1.50, (except in the far west) is a beauty. Burns 35 hours, gives 20% more light, and is wind-, dust-, dirt- and rain-proof.

There's an Embury for every purpose

ORDER FROM YOUR DEALER

If he has none in stock, we will mail on receipt of price.

*Price for July.

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firm during week ending Sept. 6th. Movement of goods active at prices representing fair margins to dealers. Anticipated demand for September made cheese together with usual tendency of prices during month appear as supporting influences.

The average wholesale prices on American cheese, style Twins, for the week ending Sept. 6, 1924, for the corresponding week a year ago and for the previous week were as follows:

	Ave. for the week ending Sept. 6 1924	Aug. 30 1924	Sept. 6 1923
	Cts.	Cts.	Cts.
New York	20.7	20.7	25.8
Chicago	19.1	18.8	23.6
Boston	21.2	21.2	26.7
San Francisco	18.9	19.0	26.4
Wisconsin Boards	18.8	18.6	24.5

The receipts of cheese at these markets were 4,318,540 lbs. for the week as compared with 4,368,757 lbs. last week and 4,246,753 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets continued unsettled during the week ending September 6. Trend of prices uncertain and subject to influences of immediate supply and demand. Into storage movement slower as operators were less willing to assume resulting risk. Street stocks were heavier. Production is still running heavy. Firm foreign markets permit small export business.

The average wholesale prices on 92-score butter for the week ending Sept. 6, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Sept. 6 1924	Aug. 30 1924	Sept. 6 1923
	Cts.	Cts.	Cts.
New York	38.1	38.5	45.0
Chicago	37.1	36.8	44.9
Philadelphia	39.2	39.2	46.0
Boston	38.8	39.0	45.2
San Francisco	40.1	40.7	47.4

The receipts of butter at these markets were 13,813,177 lbs. for the week as compared with 15,531,307 lbs. for last week and 11,423,505 lbs. a year ago.

Wisconsin July Butter

(Wisconsin Department of Markets)

The following is an average report of the operations of 140 co-operative creameries in Wisconsin for the month of July, 1924:

No. of creameries	Price paid for fat	Ave. price rec'd for butter	Ave. overrun	Ave. am't fat rec'd
	Cts.	Cts.	%	Lbs.
3	45	38.9	22.4	62,459
10	44	37.8	23.3	61,128
22	43	37.6	22.2	41,823
34	42	37.2	23.7	29,531
25	41	37.0	22.6	41,844
24	40	36.7	23.2	25,960
7	39	36.6	21.9	17,041
5	38	37.7	21.9	36,417
8	37	35.6	18.5	11,898
2	36	35.9	21.0	30,307

Milwaukee August Prices

The Milwaukee Co-operative Milk Producers announce the following prices for the month of August:

For the portion sold as fluid milk $2.85 per cwt. for 3.5 per cent milk; and for the portion manufactured, $1.38 per cwt. Four cents added or subtracted for each one-tenth of one per cent variation. Seventy per cent of the total receipts was sold as fluid.

CHICAGO, Sept. 15—The butter market today was steady on all grades with the best demand reported on the medium and lower scores. Considerable business was transacted early this morning on 92-score butter at a half-cent advance over Saturday's price. The centralized car market was easy, with trading dull.

Fresh butter—92-score, 37½c; 91-score, 36½c; 90-score, 35½c; 89-score, 34½c; 88-score, 34c; 87-score, 33c; 86-score, 32c. Centralized carlots—90-score, 36¼c; 89-score, 34½c; 88-score, 33½c.

FOND DU LAC, Wis., Sept. 12—Average cheese prices (majority of sales), f. o. b. shipping point: Twins, 19½c; single Daisies, 20¼c; double Daisies, 19¾c; Longhorns, 20½c; square prints, 21¾c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Sept. 13: Single Daisies, 19c. On Farmers' Call Board Sept. 12: Single Daisies, 20c; Longhorns, 20¾c; square prints, 21⅜c.

MILWAUKEE, Sept. 15—Butter—Creamery, extra, tubs, 37½c; standards, 36½c; extra firsts, tubs, 34@35c; firsts, 32@33c; seconds, 30@31c.

Cheese—American full cream, Twins, 19½@20c; Young Americas, 20@20½c; Longhorns, 20@20½c; Daisies, single, 20@20½c; squares, 22@22½c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

NEW YORK, Sept. 15—Butter—Steady; receipts, 6,105; creamery, higher than extras, 38½@39c; creamery, extras (92-score), 38c; creamery, firsts (88- to 91-score), 35@37¾c; packing stock, current make, No. 2, 27½c.

Boys and girls from 17 states will exhibit 350 calves.

There will be on exhibition and sale 180 grade record cows.

What Shall I Name My Farm?

HOARD'S DAIRYMAN:—In this article I propose to keep away from generalities, and to offer definite help and suggestions for the naming of your farm home. W. A. Sumner says there are only a dozen requisites for a name for your farm. Mr. Sumner lists them thus: simple, dignified, easy to pronounce, easy to remember, distinctive, euphonious, appropriate to the farm, modest, easy to read, short, bring up a mental picture (visualize the farm or its products), and original.

I propose to start with number seven, "appropriate to the farm", and twelve, "original", and the other ten points will fall into place almost automatically you will find. Has your land any marked physical characteristic that would lend itself to becoming a name for your farm? "Hill", "valley", "wood", and similar names have all been used time without number. However, we can find similar meanings in words of the Indian language, words which are at once musical and unique.

How do you like Aspatock, meaning "high land"? Or Cadoma, "hidden", for the valley farm? Cohasset (place of the pines) and Dockmachie (maple-leafed viburnum) are lovely if one's farm is conspicuous for these growing things. Tekemah means "big cottonwood". Suitable for some one farm in a hilly region is Katahdin, "highest place". And for the prairie farmer is Tuscola, "a level place", or Tintonwan, "prairie dwellers".

For those with streams and rivers flowing through the fields and wooded land are Kampesha, "bright and shining"; Minneota, "plenty of water"; Sappomah, "deep waters"; Tioga, "at the forks"; and Watonwan, "plenty of fish".

Is your farm situated on a road which curves many times past your acres? Then what would you think of Washkama, "the road is crooked"? These Indian names stand alone when used. They need not be followed by the word farm, acres, home, or similar nouns. Some names, however, need appendages, and a few are suggested here: bluff, brook, dale, fields, forest, gate, glen, heights, hollow, place, and wood.

Name beginnings may be derived from a variety of sources. They may come from the name of the farm owner, from the location of the property, from some of the outstanding physical characteristics of the place, or from the chief work or product of the land. The average American farmer seems to be averse to having his name blazoned on barn and gate post, so he chooses some other thing or feature.

The Lindens is the name of a charming old country home which has been in the hands of one family for generation after generation. The really remarkable grove of linden trees on the place is its most outstanding characteristic visible to the eye, and as the produce of the farm is not marketed, there would be little value in selecting a name which could be utilized for business purposes. Cottonwood Acres is another such name.

Fox Lair has been chosen as the name of a fox farm in a northern state, while Bird Ridge Farm has been selected for a place which stands high above the neighboring country and to which bird lovers from a wide area flock at all times of the year to study the specimens which come there with the changing seasons.

Deep is a good name beginning. It can be made into Deep Woods, Deep Meadow, Deep Shade, or Deep Water, according to your own farm's possibilities and your own taste. Fair is another beginning which may be made into many things. So are Great, Green, High, Lone, Many (Many Shadows, Many Waters, Many Breezes, etc.), Sunny, and Tall. These, however, are only a few.

Then, should you desire to incorporate the idea of your business into your name, there are the words dairy, stock, grain, etc., which may be used. But why not do it more suitably? For instance, there is the lovely Indian word Modamin, meaning "corn". Sarnia tells the whole story to Guernsey breeders, while The Black and White Farm is equally expressive.

These are only suggestions. Just think of the things that are peculiar to your farm alone, select the one that you desire to feature, and behold, you have the only name for your farm, and a name which cannot well belong to any other farmer.

Illinois. FRANCES M. HUGHES.

Jersey Cattle Notes

Week ending Aug. 29, 1924:

Number of animals registered: Bulls 232, cows 727, total 959. Number of transfers recorded: Bulls 239, cows 679, total 918.

The Indiana State Fair

(Continued from page 248)

C. J. & W. A. Connell of Wisconsin. This bull, Defender of Waddington, is a very straight lined two-year-old of excellent character, which gave him the senior and grand championship.

Gayoso Farms made a very strong show in the remainder of the bull classes by winning first and fourth in the yearling classes; first, second, and fourth in senior calves; and first in junior calves.

The winning aged cow, Sepasoot Pearl, was shown by George & Mackay. She was a remarkably good cow with true dairy type, a capacious udder, and a strength of make-up that made her a real favorite and a popular choice for the senior and grand champion honors.

Gayoso Farm won both first and second in the three-year-old class as well as first in two-year-old heifers. Goodhand Kingston & Son brought out the junior champion female in the winning junior yearling, Muskego Colleen. A daughter of Itchen May King, from the Fox herd of Waukesha County, won the senior heifer calf class, while the Sweets Springs herd won the junior calf class. Professor L. H. Fairchild of Purdue University tied the ribbons.

Ayrshires

Adam Seitz & Sons of Wisconsin had things about their own way in the Ayrshire show. All firsts and championships were won by them with the exception of the yearling bull class that went to Walter J. Barnett of Indiana.

Cavalier's Sherry Redman, with his true dairy type, won the two-year-old class and went on through to senior and grand champion honors. Lucindy of Spring Castle 4th won the aged cow class and was made grand champion female. She is a good cow with capacious middle and plenty of udder of the proper shape. Professor W. W. Yapp of the University of Illinois made the awards.

ADELINA'S SULTAN, GRAND CHAMPION JERSEY BULL AT INDIANA STATE FAIR
OWNED BY PEBBLEHILL PLANTATION, GEORGIA

Believes in Tuberculin Test

HOARD'S DAIRYMAN:—I feel I must reply to Illinois Dairyman in regard to his "Dozen Reasons Against T. B. Testing."

His first "reason" is that scientists disagree as to whether bovine tuberculosis can be transmitted to humans through raw milk. Scientists disagree about many things; for instance, some say tuberculosis is hereditary while others deny this flatly, claiming it is a contagious disease transmitted by the sputum of the victim, by handkerchief in use by same, dishes improperly sterilized, and by flies. This may be propaganda but I dare say our friend would not eat after a T. B. patient. Bovine T. B. affects the bones of humans and makes its most vicious attack on infants whose sole food is milk. The very thoughts of feeding germs to helpless babies dependent upon our care should make any red-blooded American dairyman have his cows tested.

Available statistics prove that 7% of the bone tuberculosis in the United States is directly traceable to tubercular milk fed to children. Everyone knows that raw milk from a clean herd is preferred to pasteurized milk for infant feeding. It is also a known fact among dairy people that pasteurization never makes good milk out of bad. More stress should be laid on producing clean milk in the first place.

Another of the "Dozen Reasons" is this: He must fence his stream and double fence between his neighbor and himself to keep his cows from nosing a bunch of untested steers. Are Holsteins addicted to the habit of nosing or is it a trait among Illinois cattle? I have never noticed cows nosing each other across fences here in Virginia. After six consecutive years of testing without a reactor in a neighborhood of untested cattle, I would say that infection from chance meeting with untested cattle is negligible. It is the daily association with them which causes trouble. The man who "sneaks" on his agreement with the government by bringing an untested animal into his herd usually pays when he makes his yearly test.

Now let me tell you what hurts most about T. B. eradication. Here in Fairfax Co., Virginia, Washington, D. C., is our market. It demands milk from T. B. tested cows; no other can be shipped to this market. We get two free tests from the government. After we are on the accredited herd list, it is necessary to pay a veterinarian $15 to make a yearly test and when we buy an untested cow we have to pay $15 to get her tested or run the risk and sneak as I mentioned above.

We dairymen are working on a plan now to stop this extortion which is: Each cattle owner will have free testing until his cows are clean. This is to be compulsory, then when a dairyman buys a cow from a neighbor he can do so with reasonable safety. Of course I know it means an outlay of money for the county but the dairy industry is deserving of some consideration as well as other enterprises. Why employ a health officer to look after our children of school age after we have given 7% of them bone tuberculosis in their infancy?

I believe in the test as firmly as I do in Hoard's Dairy gospel and I would not drink milk from untested cows or feed it to my children.

Virginia. CUBA GRAYSON CURTICE.

To Honor Professor Farrington

A movement begun about a year ago to honor Professor Farrington of Madison, Wisconsin, will culminate in a banquet to be held in Milwaukee Wednesday, October 1st, at the time of the National Dairy Show.

In recognition of the good work done by Professor Farrington during the thirty years that he has been actively connected with the University of Wisconsin as head of the dairy department, his many friends and former students will present his portrait to the College of Agriculture at this banquet. This painting is by the noted artist, Arvid Nyholm, of Chicago.

"Well, Pat, do the twins make much noise nights?"

"Praise be to Hivin! Sure, each wan cries so loud yez can't hear the ither wan."—From Everybody's Magazine.

When the Shipper Will Pay More

Most consumers of butter and eggs are willing to pay in proportion to quality.

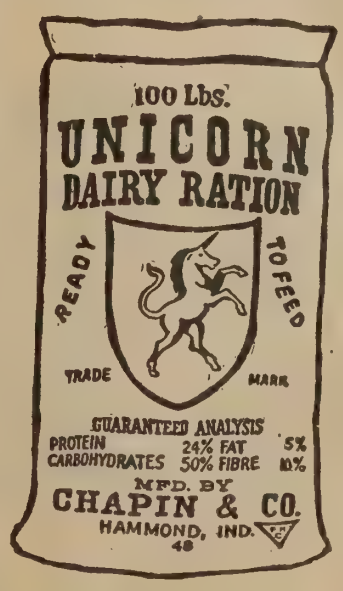
That is why selling according to grade is a mighty important matter with you who produce such goods.

The way to make more money is to get the top price from the shipper for your best run, sell the other grades for what they are, and not try to bolster up poor grade stuff by putting it in with the better grade.

Instead of lifting the poor up, you pull the good down.

Comply with Grading Rules And Get the Higher Price

There is a market for eggs and cream of all grades, but the way to make money as a producer is to separate and sell according to quality and not "jumble" them up and try to sell them in one lot.



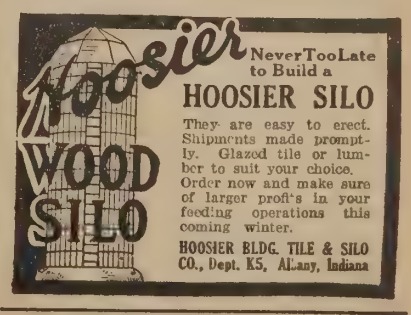
If you offer goods that will stand the test, and insist upon being paid accordingly, you will make more money. Producers must be leaders in this grading and standardizing movement, for they are the first to profit.

This is the firm belief of the Chicago Mercantile Exchange—which, as a distributing organization, with unlimited trading opportunities, has its fingers on the pulse of the world's markets all the time.

The Chicago Mercantile Exchange

LA SALLE ST. at LAKE ST.

The Market Place for Butter and Eggs



3 bags of UNICORN

will make the same amount of milk as 4 bags of most other dairy rations.

Don't take our word for this, but prove it with your own cows.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Where a Smile Is a Trademark

Miles of smiles are found on the faces of happy boys at the Norris Farm Camp in Waukesha County, Wisconsin. From 75 to 100 city boys have thrown away their grouches and found in farm life many pleasures and much profitable experience.

In the winter time they live in the fine dormitories on the farms and go to their own school. In a big barn-like structure on the farm is the new gymnasium. Two years ago the boys had their first basket-ball team and most of the members had never played this sport before. They were very successful and won seven out of twelve games, competing with outside teams from surrounding communities.

In the summer time the boys transfer their activities to camp life. About one mile from the main buildings, on the banks of the Fox river sheltered by forty acres of wild woods, is located this summer camp. A semi-circle of fourteen barracks and a big dining room, all facing an open camp-fire place and looking out over the river where half naked boys flounder in the cool waters undisturbed by intruders, is the picture of country contentment which we saw on our visit to this unique farm one day last summer. A leader for every barrack and a camp doctor makes life a safe and sane one for the boys. In the cool woods surrounding the camp they study wood lore and nature. Their summer camp lasts from the first of June until September 1st.

There are 573 acres of farm lands to be given attention and the boys all have their part to take in the farm work. Some raise fruit, others are interested in gardens and still others in live stock. In 1917 Niel Norris, a young man who wanted to do unto others as he would that they should do unto him, established a summer camp for needy city boys; some were orphans, others had poor home training and needed to be polished off. The camp was so successful that it was turned into a year-round proposition. Now boys come there from all parts of the country.

Rural life is used to make these boys better citizens and religion is not neglected. They have their own Sunday school classes and the boys themselves teach the classes.

The Norris Farms' calf club has been going four years and the boys have won many prizes. They get together for meetings and talk things over. They take a great deal of pride in their calves and each year exhibit them at the Waukesha County calf round-up and the Wisconsin State Fair. Although the boys do not own the calves, they are given entire charge of them and they feed, clip, scrub, blanket, and polish their calves, and show them with a great deal of pride.

GROWING BOYS AND CALVES ARE A GOOD COMBINATION

This picture was taken a year ago at the Norris Farm Camp. The boys from left to right are: Mitchell Karboski, Percy MacFarlane, Norman Masters, Martin Hansen, Carl Bublitz, Clarence Rohde.

MEMBER THE OLE SWIMMIN' HOLE?

Here is where the Norris Farm Camp boys cool off in the good old summer time.

Here are the winnings that these boys made this past year: At the 1924 Waukesha County Round-up, on bull calves, Mitchell Karboski won first prize; Joe McLay, second; Mathew Munger, sixth. In the heifer class Mathew Munger, second; Herbert Smith, fourth; Mitchell Karboski, eighth; Melvin Steber, ninth; Percy MacFarlane, tenth; Steven Cinky, thirteenth. Grade heifers, Percy MacFarlane, seventh. In the Showmen's Contest Joe McLay won third and Steven Cinky, fifth. Since there are about 80 head of registered Holsteins in the herds of the Norris Farms, the boys are all Holstein members.

Two years ago Joe McLay was declared the best calf club member at Norris Farm but this past year Percy MacFarlane won the honors. Percy won a beautiful silver trophy in recognition of the fact that he had been declared the best calf club member in Waukesha County.

Philosopher Phil Says

Once there was a boy who owned a calf and belonged to a calf club. Attending high school in a nearby town made it necessary for him to be away from home at an hour when his calf should be fed. He knew that as a calf club member he should take the entire care of his calf. He wondered how it could be arranged that he might be responsible for that calf getting its meal. After a little while he devised this scheme:

Over his calf's feed box he arranged a chute. At the top of the chute was the calf's meal. He took an alarm clock and set it for the hour at which his calf should be fed. Then he fixed this clock in such a way that when the alarm went off it would pull a string and open the chute. The feed would then go down in front of the calf. Through originality and resourcefulness he overcame one of his immediate problems as a calf club member and could honestly say that he had taken the entire care of his calf.

Where the Tall Corn Grows

Iowa boasts of one of the biggest and best 4-H club camps at her state fair of any in the Union. And she has a right to. During the last week in August more than 1,200 boys and girls of the Hawkeye state participated in making good this boast.

Here is the way the live stock exhibits lined up—about 600 baby beeves, making the biggest show of its kind in the world, 500 swine, almost 100 sheep, and about 560 birds in the poultry show. P. C. Taff is director of Iowa club work.

Besides this wonderful showing of exhibits there was keen competition among one hundred thirty-six teams demonstrating almost every imaginable sort of home economics and agricultural project. Demonstration team work among Iowa farm girls has grown tremendously. In 1920 there were only 19 girls' teams demonstrating. This year just 106 teams competed.

To further prove her leadership in club work Iowa points to the following facts: that the first Adolescent Health Contest for 4-H club boys and girls in the United States was held in Iowa. That the first Rural Music Memory Contest was held among the 4-H club girls of Iowa. That the first state campaign for better shoes among farm girls was put on in Iowa among club girls. That Iowa has the largest pig club show in the United States. That this state is the first to publish and print a daily paper for the club boys and girls at the state fair. That Iowa operates the largest dining hall for club boys and girls of any state.

The club newspaper was published at the state fair camp for the first time this year. G. L. Noble, secretary of the National Committee on Boys' and Girls' Club Work, was editor-in-chief. It was a dandy little four-page sheet three columns wide. The printing and engraving were done at a down town office free of charge. There were five issues during the week. In a contest for the best name for the publication "The 4-H Club News" was selected.

Nearly eighty boys and girls were entered in the fourth annual health contest. Practically all of the entrants were good physical specimens. Ferrill Liscomb, 14, and a sophomore in high school was finally chosen as the winning boy. Early to bed and early to rise is one of Ferrill's health rules. He eats bacon and eggs for breakfast and when asked if he drank much milk he replied, "Not much, only a quart a day." Ferrill did a man's work on the farm this summer. He likes to swim, hunt, and ride horseback.

FERRILL LISCOMB

DORIS POORBAUGH

Doris Poorbaugh, the winning girl, is seventeen and a senior in high school. Her bed hour is 8:30 and rising hour between 6:30 and seven. She drinks considerable milk in the winter time and is fond of potatoes. According to the physicians her snappy eyes scored 100 per cent and her ears and feet were also perfect.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

We are now on our eleventh lesson on sweet clover pasture. We have learned of the many values of this crop—as a milk producer, as a labor and land saver, and as a soil builder. Mr. Fraser has recently told us that there are two requirements in the successful growing of six months pasture—lime and inoculation. He has pointed out that the best variety to grow is biennial white sweet clover. In last week's issue of Hoard's Dairyman, Sept. 12, he tells us how to get the most out of sweet clover pasture.

Give two rules for success with sweet clover pasture. (1) Let the clover get a good start the first year—it should be 12 to 15 inches high before pasturing. This will make it possible for the plants to store up more food and get an earlier and thriftier start the next spring. (2) Turn the stock on early in the spring when the plants are no more than four or five inches high. The plants are most palatable before they have become two feet high.

How can you keep the crop down the second year? Pasture enough cows on it. Three-fourths of an acre per head is all and sometimes more

than can be economically used for pasture the second year.

Name a good crop rotation with sweet clover. Corn, corn, small grain seeded with sweet clover, and sweet clover pasture. For a three-year rotation omit one year of corn.

Give a good practice in sowing sweet clover for pasture. Sow a double acreage, pasture the crop in the fall, and plow under half. This gives the pasture crop a chance to get a good start in the fall. The half that is plowed under is an excellent soil improver.

What is a biennial? A biennial is a plant that will not die at the end of the first year. It does not live longer than two years.

Tell how Mr. Harter made a success with Jerseys. For years this Ohio farmer found his fight against the mortgage an uphill one. He was urged to test the production of his cows. He did so, and discovered that of the five cows he was testing all were in the Register of Merit class, three were gold medal cows, and one a state champion. (See article "Good Results from Hard Work").

If you change milkers on a cow will that change her butterfat production? In tests conducted at the Maryland Dairy Experiment Station the Dairy Bureau of the U. S. Department of Agriculture it was found that there was a slight advantage in favor of one person milking continuously. Where one person milked continuously cows produced as much as 0.6 per cent more butterfat than when milkers were changed. (See article "The Proving Ground of Dairy Farmers").

Will a cow give more butterfat confined in a box stall than in a stanchion? Yes, cows in box stalls gave some more milk containing a little more butterfat, and they gained some in body weight, but the extra expense of care does not make it profitable.

Junior Letters

A Junior Missionary

Hoard's Dairyman Juniors:—I enjoy being a member of your jolly junior club very much. I received my creed, badge, and button. I like my button because it has my favorite cow's head on it, Holstein. Of course I like my creed and badge, too. I wear my badge and button very often. All my friends think they are very nice, and ask me where I got them. Several of my friends have promised to join the jolly club soon.

We have two large horses, Mack and Prince. I pride Prince most, becaues he is the gentlest. He will eat candy, sugar, and apples out of my hand and will follow me all over the barnyard for a piece of candy. We are starting a small dairy. We have our milk house finished and the workmen are going to build a new modern barn about the first of next month, using the latest dairy barn equipment. We have about 25 Holstein cows and about 30 or more calves, Holstein, Guernsey, Jersey, and mixed grades. My father is going to sell all but the Holsteins as he likes them best. I have one registered Holstein calf 17 months old. Most every one thinks she is about two and a half, she is so large. I also have a grade Holstein 15 months old that is nearly as large but not half as pretty. I am very much interetsed in dairy work. I am going to try to get the better dairying "gospel" started by getting all the Hoard's Dairyman subscriptions I can in my community. I guess you juniors think this letter is from a boy. But it is not. It is from a real girl, although I wear knickers most all the time at home. I am 16 years old now.

I will be glad to answer all letters the juniors wish to write me. My address is Canton, North Carolina, R. F. D. No. 2.

Minnie Morgan.

Stripping Tobacco in Wisconsin

Hoard's Dairyman Juniors:—I received your letter asking me to tell about stripping tobacco. We take it down from the poles when it is cured. I suppose you know it has to be in the shed so it will cure. We take the tobacco from the laths. Then we strip the leaves off the stalk one by one. We must be careful to get the leaves even. We have a box ready to bale it in. We have one long box and one six inches shorter. We put three strings in the box, one on each side and one in the middle. We then put a paper on top of the strings. The best grade we put in the largest box. The one that is torn or damaged in any way we put in the short box. When the box is full we press it by taking a board the size of the box, we put it on the box, then two of us get on and press it. That is fun. We press it twice. Then we tie the bale. Each bale weighs about 60 lbs. Sometimes we make 3 grades.

Wisconsin. Delia Trissoni.

A California Dairy Maid

Hoard's Dairyman Juniors:—My picture was taken in February. The almond tree is the background. As you can see it was in blossom. The calf was 3 months old then. Her mother held the state record for some time.

We have 50 acres. On it we have grapes, walnuts, figs, plums, quince, pears, apples, apricots, pomegranates, persimmons, berries,

IN THE SHADE OF THE BLOSSOMING ALMOND TREE ARE MARIE CONANT AND HER CALF

oranges, beans, and alfalfa. Then we have 8 cows, 3 heifer calves, 3 bull calves, pigs, chickens, cats, horses, and rabbits. The rabbits belong to my older sister.

My older sister and I were home for ten days doing the chores, milking and a little other work, while the rest of the family enjoyed a vacation at Richardson Springs. We will go to Big Basin with some of the rest later on. There are ten in our family, eight children; the youngest was 3 in June.

As my letter is getting long I think I will close. Wishing all the juniors all good luck. If any of the juniors want to write to me I will answer their letters promptly. My address is R. R., Box 231, Modesto, Calif.

Maria Conant.

Orpha Writes Another Poem

Hoard's Dairyman Juniors:—We make butter all year round. Some weeks we make over a hundred pounds. We are now milking 20 cows. We have 28 head of cattle.

There are a lot of birds here now. Oh! how they do sing. No one can help but be happy and let all care fly to the four winds, when they hear the robins say "cheerup, cheerup". All of the other birds sing lovely, beautiful songs, too.

I am going to send another poem which I hope will be liked as well as my other one was.

AT SUNSET

The West is all a fiery red,
With a touch of yellow and gold,
It's time for the children to be in bed,
And have bed-time stories told.

The birds are singing their evening song,
Then flying away to rest;
And the sun is shedding its last bright rays,
Out in the fiery West.

The evening twilight's coming on,
And the grass is wet with dew;
And there is a lovely peace over all,
That is sure to comfort you.

New York. Orpha Williams.

Where the Tall Corn Grows

Hoard's Dairyman Juniors:—When Hoard's Dairyman comes to my house I am always anxious to sink my mind deep into the Junior Department and read the letters from the junior editor and juniors. I am satisfied that we have never taken any paper that had a boys' and girls' section that could ever compete with Hoard's Dairyman. And I will say that this is one family that likes good reading.

I live in the state where "The Tall Corn Grows" four miles from town on a half section farm. I am one of a family of eight children.

Iowa. Clifford W. Withers.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

ATWATER KENT

RADIO

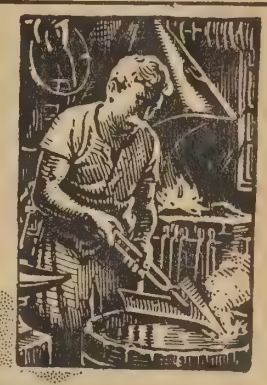
BACK of Atwater Kent Radio there is a tremendous factory with laboratory and manufacturing facilities that are not surpassed in the whole world—

—there is the spirit and guiding impulse of master workmanship—

—there is a nation-wide reputation for precision—and a recognition of the name "Atwater Kent" as a standard of excellence—

—there is the accumulated experience of more than a quarter of a century in the manufacture of scientific electrical instruments—

It is these qualities and high standards that have produced leadership for Atwater Kent Radio;—and have made it what many consider perfection in radio construction.



Atwater Kent Manufacturing Company
4947 Stenton Avenue, Philadelphia, Pa.

THINK OF WHAT IS BACK OF IT

Motor Oil

that's "Tempered!" to sturdier duty

THE Wadhams Tempering process preserves the full, sturdy oiliness of crude petroleum's richest portions. The benefits are certain—definite. Tests prove that *in use* Tempered holds from 10 to 36% higher viscosity than other high grade oils. And that Tempered lasts longer. And that it holds down carbon troubles to the minimum.

Wadhams Tempered Motor Oil

deserves to be your single choice. Using it steadily will mean longer life for your motor car. It will mean lower upkeep costs on your tractor. Your nearby dealer has the correct weight for every make. When you buy oil—look for the red disc sign.

WADHAMS OIL CO., MILWAUKEE

Established 1879 S. S. CRAMER, President.

Reason for a Truck

The other day pa got quite riled,
When "Miser" Ole Brown
Drove up and stopped, looked 'round and popped
A question with a frown:
"Now what in all tarnation, pray,
Has in your brain got stuck,
That you grab off a luxury—
A spankin', brand-new truck?"

Pa's not the man to hesitate,
And "Miser's" not his kind,
So pa, like Patrick Henry, starts
To give a piece of mind:
"I'm not like some who boast of brains
As empty as a shuck;
And that, it might be stated, is
My reason for a truck."

"If trucks were not economy,
How many would be sold?
If time is turning backward, why
Do you and I get old?
Try waking up and from your mind
Some mental cobwebs pluck,
And you'll not wonder very long
On why I bought a truck.

"Just listen and I'll do for you
Some neat arithmetic;
It's quaint, I know, but still, in print,
It looks quite rhetoric:
My farm from town is eight miles west,
And each day there is cream;
It takes four hours six days a week
To transport it with team.

"Now with a truck it takes an hour—
Three hours I save a day,
Six days a week I save eighteen—
How much is that, I pray?
Or in a year what would it be?
On hauling cream alone?
You're talking, Brown, like folks once did
About the telephone.

"There's just two ways of looking at this,"
Pa argues without halt,
"Namely: Is time worth anything?
Or, aren't you worth your salt?
If 'no' you say, then I give up,
I've truly run amuck;
You can't expect to understand
My reason for a truck."

R. D. GALT.

Vertical Log Construction

HOARD'S DAIRYMAN:—The greatest expense in the development of a new farm is the building proposition. What I am interested in is how settlers, particularly in Northern Minnesota, may go about in developing their farm at a minimum expense in constructing their buildings.

There are two kinds of log houses or buildings, the horizontal and the vertical. In the case of the horizontal type, large logs are necessary, some 12 to 18 feet in length and from eight to 12 inches in diameter. Not all cut over and timber lands in Northern Minnesota will provide such logs. Then, too, such logs have a very good market value. The vertical log type may be constructed from short logs 7 to 9 feet in length and from 5 to 8 inches in diameter. Such logs have little market value and are found in large numbers on the average clearing.

The vertical log type of building has several advantages over the horizontal: 1. Shorter and smaller logs necessary, hence easier to secure. 2. More quickly and easily constructed. 3. Will last longer because the water will shed off the logs more rapidly. Horizontally placed logs which crack will gather water, while if set vertically, water will drain out, avoiding rotting.

It is important that the proper procedure be followed in the construction of vertical log buildings. A concrete foundation should first be constructed. The part of the foundation on which the logs are to rest should be from 6 to 8 inches wide depending on the size of logs to be used. On the inside of this, another step should be so built so as to permit the floor joists and the first floor to be even with the outer foundation on which the logs are to rest. This part of the foundation should be perfectly level.

If six-inch logs are to be used, take two 2x6's, placing one along the edge of the floor next to the concrete part on which logs are to rest. Place the other 2x6 about 8 feet in on the floor. Each scantling must be placed on edge. Now place between these scantlings your logs. Start from each end, selecting straight logs for the ends. Place the rest of the logs in between, rolling them around until they fit best. Spaces for the windows may also be inserted while in this position. When all the logs are

A COMBINATION VERTICAL AND HORIZONTAL LOG ARRANGEMENT

Eight-inch logs were used in this case. The exposed parts of the peeled logs have been oiled.

in place, spike thoroughly, using large size nails, two in each end of log. When this is completed, nail two braces on diagonally across the wall. This will keep wall straight while being raised. Tip the wall up in place. Nail two-inch strips from top 2x6 to bottom 2x6 at each end, on which a level is placed so as to keep wall straight. When in proper place and leveled, nail in place and brace.

Prepare the opposite wall in the same manner, then the ends. When they are all up, nail together and bind by means of the second plate. The rest of the building may now be completed like any frame building. Strips may be nailed from top 2x6 to bottom 2x6 the desired distance apart, blocks filled in and the wall may be lathed and plastered, or wall board used. A perfectly straight, smooth wall is assured.

"Chinking" should be done with a 4 in 1 mixture of sand and cement. It is of advantage to drive in nails, leaving head exposed about one inch along between logs where cement is to be applied. These nails may be about 6 inches apart. To get a coloring effect, color may be added to cement mixture. No cement work should be done unless logs are absolutely dry.

Any style of building may be successfully constructed. Good dwellings, poultry houses, barns, garages, machine sheds may be built. If properly "chinked" they make very warm buildings. This is particularly true if they are lined, or sheated.

The exposed part of the logs on the outside may be sand-papered and varnished so as to bring out the coloration of the wood.

If the necessary logs are available and you supply your own labor, log houses of this type may be constructed much cheaper than the ordinary frame.

Minnesota. A. H. OLESBURG.

On July 1st there were 730 cow testing associations in operation as compared with 627 the previous year. The average production of the 61,000 cow testing association cows, for which records have been tabulated, is 6,274 lbs. milk containing 257 lbs. fat. This is about 60% more than the average production of all cows in the United States.

Erasing the Date

It is said that the famous Dr. Charles Mayo told a meeting that he was addressing, "Every human being has a card on which are written in indelible ink his name, his address, and the fact that he will die. The date of his death and the disease from which he will die are also on this card, but these are written with pencil and may be erased and changed."

Changing these and setting back the date is a game that interests everyone—not only grown persons for themselves but for their children.

Some allowance must be made for accidents but in the main good health is simply a matter of common sense and up-to-date information from reliable sources, not quacks.

"She knew they had it—or at least she should have—and then she let my children be exposed," sobbed a worn-out mother to me lately. It was whooping cough, a disease that is dreaded more and more as its mean nature is more fully discovered. An astounding number of children and even grown-ups die of this disease every year and thousands more are so weakened by it as to be easy prey for other diseases.

In the case referred to the mother of the coughing children was an easy-going person—the sort that prides herself on never worrying about anything. That is a very admirable trait except where it is found with a lazy disposition to "let things take their course". This time her carelessness had led to the infection of a whole family and an already overworked mother was battling with a dangerous case of whooping cough—four children sick at one time.

Whooping cough is only one of the diseases a thoughtful mother has to consider at this season of the opening of schools. It is so difficult—and yet so necessary—to draw a line between fussiness about health and carelessness. It would be fine if we could simply disregard our bodies, but Nature has certain laws and she insists upon payment if we break them.

We are all constantly exposed to germs that we know nothing of and if we took all the diseases that we have a chance to we would spend most of our time being sick. The best safeguard there is, is a body that is always kept up to its maximum of fittness by proper eating, sleeping, and working and in addition a sensible, but not worrying, regard for the laws of disease.

I hope that you have all been able to secure teachers who are not only healthy themselves (these always have a more wholesome effect on children) but who understand and will practice simple rules of health and hygiene in their school rooms.

One of the most notable cases in the improvement of the average health of school children was effected in a Wisconsin village when a resident of the village was put in charge of school health. He did not believe in closing schools but he did believe ardently in excluding from school any child that showed any sign of a cold though it was only a sniffling, wateriness of the eyes, or other slight symptom.

It is thoroughly established that many serious diseases start from the same symptoms from which a cold starts. Also that what is a "common cold" with one child may be something serious if passed on to another. This man kept careful records and he found that by sending home all children who showed traces of a cold he actually increased the percentage of attendance and the efficiency of the school.

Some parents take it as a personal affront if the teacher sends home their child for any cause. This is an unworthy and unintelligent attitude and no broad-minded, sensible parent will act without being sure a wrong is done.

I am reminded of a man we know. His little boy came home from school morning after morning saying, "Teacher sent me back because I've got a cold; she said not a very bad one but I should stay at home today." After the fourth day of this the father was so furious that he took the child to a doctor who found no trace of a cold. Then there was a very undignified explosion! He flew first to the health officer and then to the teacher giving them both a large piece of his mind.

Imagine his consternation to have the boy, on investigation, confess that he had made up the stories so that he would not have to go to school "because there is a boy there that said he was going to give me a licking".

The teacher should always have the benefit of the doubt and of kindly investigation and support when it is needed. She is a very important person in the life of a child and if she is wise and observing and has the co-operation of parents she can do more than doctors and health officers combined for the well-being of her pupils.—LUCY THOMPSON.

Frosting Recipes

Sugary failure ne'er spoils your cake
When you an uncooked frosting make.

Unboiled frostings are attractive and tempting when properly made and give little opportunity for failure, declare food experts at the University of Wisconsin.

Butter icing is the richest kind. It is made by beating 1 cup of butter until creamy and then gradually adding confectioner's sugar until stiff enough to spread. The desired amount of flavoring is then added. Attractive individual cakes are made by covering the sides of squares of white cake with a layer of butter icing and by decorating with blanched almonds.

Cream frosting is made by working cream into powdered sugar with a fork until the right consistency is obtained. Flavoring is added and vegetable coloring, if desired. Fancy cakes may be made by painting letters or designs on the frosting after it has set. A large water color brush is generally used and should be kept in the kitchen for that purpose. It should be washed with warm water before being put away. Birthday cakes delight the children when they are decorated with pink candies or chocolate letters made from frosting which is just moist enough to spread.

Chocolate frosting is quickly made by adding two cups of powdered sugar to a mixture of 1 square melted chocolate, 4 tablespoons of hot water, or 4 tablespoons of black coffee, a pinch of salt, and 1 teaspoonful vanilla. Beating makes this frosting very creamy.—University of Wisconsin Home Economics Dept.

The Kitchen Table

No woman can work efficiently in a cramped and unhealthful position. Many persons will say that there is nothing new in that remark, but when thought of in connection with the kitchen table, it assumes a new aspect. If a woman can stand erect and lay her palms flat upon the table top, it is about the right height, but if she has to lean over to do this it means that she has to lean over in doing lots of things at the table. This puts unnecessary strain on the back, which though it may be uncomplaining at first, will in time complain in no uncertain tones.

Castors or blocks may be used to raise the table to the right height, and women cannot afford to lessen their lung capacity, strain their backs, and suffer from unnecessary headaches just to save a few cents and the labor involved in raising a table to a comfortable working position. Tables should be made to fit the women rather than to make the women fit the tables.

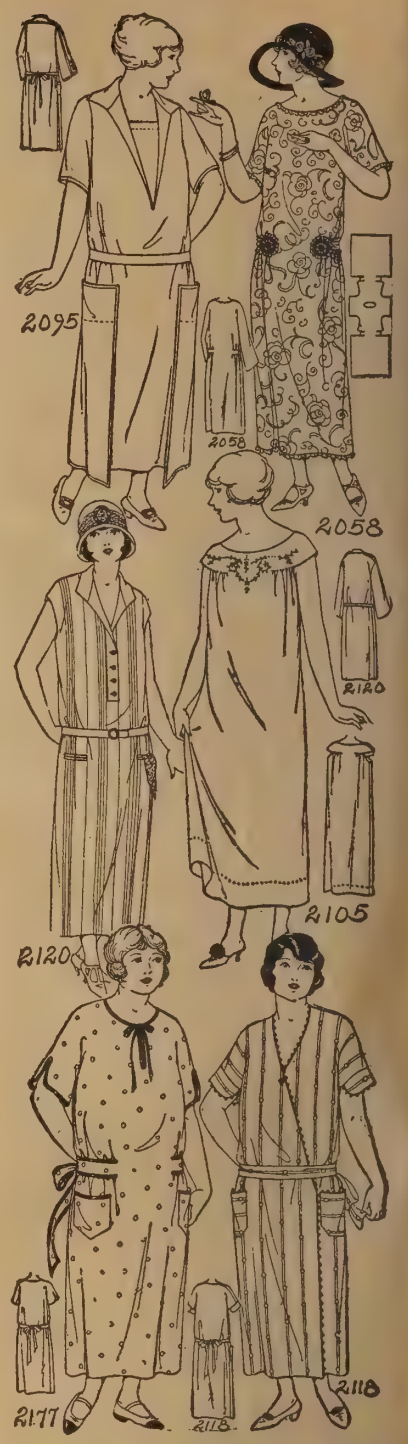
If two women of marked difference in height must use the same table, it is much better for the shorter woman in her work to reach a little upward than for the taller one to stoop too much. If necessary, the shorter woman may stand on a stool. It is always well to remember that a stitch in time saves nine as much in the realm of physical health as in sewing or anything else; and a stitch in the back is one too many.—New York College of Agriculture.

Carrot-and-Corn Chowder

This is a wholesome dish which can be used thin as a soup or can be thickened and used as a vegetable dish. Having the bacon and milk used in it makes it very nourishing.

Cut fine a quarter pound of bacon. Cook this slowly until brown with an onion cut up in it. Use a large onion if you are very fond of them or a small one if you want only a suggestion of their flavor.

Take a pint of sliced carrots and a pint of corn and cook each until tender. Combine with the bacon and onion mixture, add one and one-half pints of rich milk, add salt and a little pepper, boil up once, and stir in two well-beaten eggs.—LUCY THOMPSON.



An Irishman's Point of View

"Did yez see this, Mike? It says here that whin a mon loses wan av his sinses, his other sinses git more developed. F'r instance, a blind mon gits more sinse av hearin', an' touch, an'—"

"Sure, an' 'tis quite true. Oi've noticed it meself. Whin a mon has wan leg shorter than the other, begorra, the other leg's longer!"—Everybody's Magazine.

To make cold starch that will keep for several months, mix together half a pound of starch, a tablespoon of turpentine, a teaspoonful of powdered borax, and three pints of boiled cold water.

Miscellaneous Fashions

No. 2095—One-Piece Dress for Ample Figures. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3¾ yards 40-inch material.

Friendly Talks for Farm Folks

The United States government now has four creameries turning out number one butter for the gobs of the navy. The butter is packed in five-pound hermetically sealed tins, so that it may be used aboard warships and carried into the tropics without refrigeration. It seems to us that we have heard whispers in the past of 'oly' being served aboard. If so, the government is making due amends and seeing to it that our sailors know that real June butter flavor only from now on.

Tim Tarbell and his wife keep summer boarders for the sake of ekeing out a living on the farm, and as might be supposed, some of the city gentry are occasionally supercilious and high and mighty at their hosts' expense. The other day a smarty from New York accosted Tim as he was slopping the hogs, and inquired, "Say, Rube, what do you do for a living when we folks leave you?" Tim kind of looked him over and then said in a dry tone, "Waal, 'bout the same as we do through the summers. Keep on fattening hogs."

We say it again with every force possible: If the farmer and the city worker could only change places for just six months and actually find out at first hand how the other half lives, you couldn't hire either side to swap permanent jobs and never again would you hear complaints and gnashings of teeth over the mean deal life has served both. And that even takes into consideration eighty-cent wheat and work when you can get it in the big towns.

If the speed-crazy autoist were only half as much interested in not being killed at railroad crossings as the railroads seem to be not to have him, there probably would be no point in eliminating these danger zones.

As it is not particularly profitable to keep laying hens any more, we suggest to the ambitious poultryman-farmer that he keep brick layers instead and make his fortune in two or three days.

The new paper money now being prepared by the Treasury is to be blue, red, green, brown, and yellow in colors. In case we should ever get close enough to one to see the whites of its eyes we will hum something like this: The note is red, the bill is blue; just stick around, for I love you.

There may not be a great many young hired men down on the farm whom you could call real sheiks, but we notice that any half-way hard-working, presentable farm hand can have the hand of his employer's prettiest daughter for the asking. Hired men are scarce articles these days, and the canny farmer-father knows it full well.

In the country the tired farmer and his family retire as soon as the bedtime story has been broadcasted, while down on "the sidewalks of New York" the tenement kids are just getting ready to begin the day as Uncle Wiggly safely arrives home from his last journey in an airship.

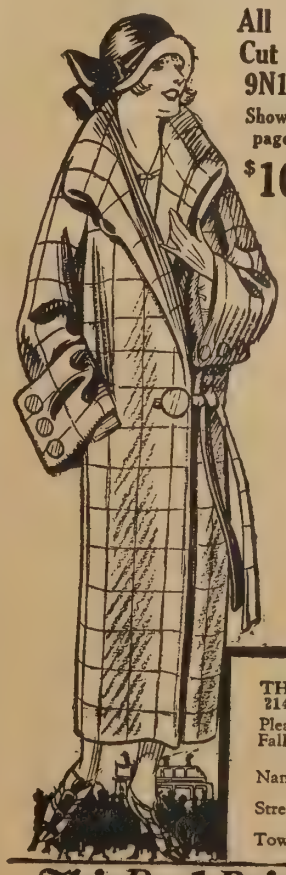
Daniel Spooner admits that he expects to keep right on making mistakes until the end of the chapter, but he does hope that most of them will be new ones.

New York. HELEN S. K. WILLCOX.

The Charles William Stores New York City Inc.

Be the first in your town to wear the new, New York Styles

This unique book of New York Styles, containing 400 pages, shows you NOW the styles Fifth Avenue will wear next month!



YES! It's true, delightfully true, that today women everywhere can dress as fashionably as though they lived in New York City itself.

But what is even more thrilling, is to know that the up-to-date things that they, and you, can buy in New York—the acknowledged style center—usually cost far less than do questionable styles bought anywhere else.

And the thing that makes this all possible is The Charles William Stores, Inc., and their wonder-book of bargains. This book is filled from cover to cover with everything to wear. Many of them are shown in actual colors.

All in the New York Manner

Here you can buy a new dress or coat for yourself; new and cunning things for the children; a new suit for the man of the family; piece goods, dry goods, notions, EVERYTHING, so long as it has to do with wearing apparel—and all in the New York manner!

All Wool Cut Polo 9N1320

POULTRY On The DAIRY FARM

J. B. HAYES

Young Poultry Dies

I must come to you with my trouble that I have with my poultry this year. In May I got 149 chicks from my incubator. When they were nearly one week old they started to die. About 40 are left. Three weeks later I got 130 from the same machine and they all died one morning. The droppings from these chicks were bloody and thin. The chicks hung their wings and in half a day or even a few hours they were dead.

I had 29 young geese and 70 young ducks last week. There are only 8 geese left and about 15 ducks. They get so weak they can't walk. Their droppings are white, thin, and like chalk.

I have turkeys which are six weeks old today, from which two died this week. They were sick three days. They have colds; when they breathe puffs form under their eyes. Their eyes are pasted shut and seem like blind; they open their beaks to breathe and there is a rattling sound which seems to come from the lungs. The droppings are white and yellow first, and then dark green.

Please write me what I can do for my sick young poultry.

Richfield, Wis. (MRS.) B. M.

There seems to be a regular epidemic of things wrong around your place when all the other classes of poultry are in trouble as well as the young chicks. It is not so unusual to encounter some trouble with chicks and a great deal more is expected with turkeys, but geese are ordinarily a cut and dried proposition with lots of good range.

An examination of the diseased stock by the Veterinary Department of the College of Agriculture, Madison, will give one very definite information concerning the cause which is not possible from a description, as any one of several diseases or conditions might be responsible. No charge is attached to this work when the specimen is received by express prepaid at Madison.

Either white diarrhea or coccidiosis might be the cause. The white diarrhea can be caused by a specific organism that is transmitted to the chick by the hen through the egg. No special physical appearance indicates this disease except in a laboratory examination. From the heavy loss you have encountered this seems to be the condition. No control except an effort to maintain vigor in the flock by proper feeding and management is possible. A drug or medicine, except that contained in milk feeding, a good ration, and proper management, will not accomplish any good.

A condition of diarrhea can be induced by improper feeding, chilling, overheating, parasites, and a multitude of other things. Correcting the condition responsible will correct the so-called disease.

Coccidiosis is becoming prevalent in chicks 2 to 12 weeks of age. Symptoms are weakness, ruffled feathers, loss of appetite, and a bloody or whitish diarrhea. The ceca is inflamed, distended, and contains yellowish or bloody material. All equipment should be thoroughly disinfected and the chicks changed to a clean, fresh range. Raising chicks year after year on the same plot is responsible. The range should be supplied with green stuff and the chicks carefully fed on some form of milk and grain until they get back into normal condition.

In the hen brooded lots, one should make careful examination for lice and the chick mite in the house. Sweet oil or other greasy material applied to the top of the head and beneath the wings and a mite eradicator to the house is advised.

The ducks and geese should be kept free from parasites and in a well ventilated house. Lack of proper ventilation at night is often directly responsible for a loss. This assumes that the ventilation can be given without them chilling.

A ration for ducks often recommended and freely used is one part corn meal, 2 parts bran, add 5 per cent meat scrap and a little fine grit and coarse gravel. Give an occasional feed of green stuff. This is fed five times a day for the first five weeks and then three times a day.

For the first day goslings should not be fed except the green feed they pick themselves. After that, feed a mash feed three times a day and allow free range or succulent green feed.

The poults have undoubtedly contracted colds that developed into roup and canker. One might try boric acid powder in the eye. They should be confined in a yarded space on short grass that is succulent. Never allow them free range for the first six or eight weeks but change the coop and yards once a week or oftener. Keep them out of rains and closed until the dew is off the grass in the morning.

Most poult troubles result from overfeeding. Feed often but very small amounts at a time to force the consumption of more bulky materia such as green feed. Dried bread soaked in milk and squeezed dry makes a good feed. In many cases corn bread is used as the feed.

From your description I should feel that there is very little likelihood of this bunch pulling through. A small dose of castor oil to each poult would be advised.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Obstructed Vagina

In the young mare one sometimes finds a fold of mucous membrane on each side of the opening of the urethra or urinary passage and it considerably lessens the caliber of the vagina. In rare cases it may prevent successful service by the male. The fold of membrane in the mare is termed the "hymen". We have met with an even more aggravated condition of the vagina in a few heifers that did not conceive when bred. The folds of membrane practically occluded the passage, its corrugations doubling upon themselves and forming a web across the vaginal opening. There is little printed on this subject in available literature, but it was spoken about many times by the late Dr. Henry Thompson of Aspatria, England, who had one of the largest veterinary practices in Cumberland. He was also a wonderfully practical and successful veterinarian, a splendid business man, a great organizer, and extension worker in his district, beloved, respected, and trusted by every dweller there, rich and poor, and continued in active practice almost up to the time of his demise when over 80 years of age. This veterinarian of the old school was also an instructive lecturer on veterinary subjects in the agricultural college of Aspatria and published his lectures in book form.

In that notable work we find a most interesting account of the condition of the vagina we have mentioned and its effect in causing sterility. He wrote that the condition, strange to say, was most commonly met with in heifers of white color. He lived in a district where dairy Shorthorns predominated. Most of them were of old Booth breeding. Only one case of the sort was met with in a colored animal and she was a light roan. Not until a heifer had been served did the condition become apparent. The symptoms developed in twelve hours to six weeks after service; most of them in twelve to twenty days. Elevation of the tail and straining as if to calve drew attention to the condition. There may be prolapse of the rectum and forcible ejection of bloody feces. The hand introduced into the rectum discovered its floor pressed upward by a swelling. Examination of the vagina found the obstruction there "immediately in front and above the neck of the bladder". Evidences of penetration of the membrane by the male organ were also found. The fluid held in by the membrane was liberated by inserting a trocar and canula, its escape being very much assisted by passing the hand into the rectum. Dr. Thompson, in this connection, added: "I have also operated upon animals that have not been served (one case being that of a white heifer 9 months old); the fluid in these cases is like dirty, milky whey with a very fetid smell, while in those that had been served the fluid was of a dirty, brown color, with a "stink" resembling that of a decayed cleansing" (afterbirth).

The condition referred to here is worth remembering as concerns heifers that have failed to conceive when bred and may have been met with by some of our veterinary readers. It seems much like the collection of fluid in the pouch of Douglass mentioned in a previous article, but that fluid has not a fetid odor. The coincidence relative to white animals being most often affected is of considerable interest and, as to that, Dr. Thompson's assertion is beyond question.

Bloated Calf

I have a registered Jersey calf five months old that stays bloated all the time, even when I keep her up in the stable; seems to be hearty and eats well, but hasn't much life and vim. When she lies down you can hear her teeth grinding together. This heifer has been this way about two months.

Centreville, Tenn. N. H.

The calf is afflicted with chronic indigestion. In some instances swallowed foreign bodies or hair balls in the stomach are the cause. Give the calf a full dose of castor oil and when it has acted mix in each pint of milk fed daily one teaspoonful of a mixture of one-half an ounce of formalin (40 per cent formaldehyde solution) and 15½ ounces of boiled water. Increase the amount of formalin if the bloating persists. Allow access to salt, chalk, and powdered wood charcoal. Lime water may be mixed freely in the milk if formalin does not prove remedial.

Obstinate Wound

I have a six-year-old mule that hurt his hind leg on a plow beam last spring. The wound is on the back part of the leg and was only a small cut at the time but caused considerable lameness. A growth came on it which I have had cut out twice and bound pulverized blue vitrol on it for several days without being able to stop it. Our veterinarian does not seem to be able to cure it. What do you advise?

Lineville, Ia. E. D. C.

It is quite likely that the bruise shattered or cracked shell bone of the leg at the point where the wound occurred and that the affected bone is now diseased and preventing healing. The veterinarian should probe for and remove loosened affected bone, curette the wound, disinfect it well and then treat as a common wound until healed. If no such cause is found present, wet the wound 3 times daily with a lotion composed of 1 ounce of sulphate of zinc, 2 drams of chloride of zinc, ½ a dram of dilute hydrochloric acid, and 8 ounces of soft water. Tie the mule so that the wound cannot be rubbed.

Barrenness

I have two Holstein cows that come in heat regularly and yet I cannot get them with calf. I have tried different breeds of bulls but they all fail. The cows are not very old yet. Is there anything I can do to fix them up?

Michigan City, Ind. P. P.

As the causes of failure to conceive when bred are many and different, there can be no one specific remedy in such cases. In many of them an infected condition of the neck of the womb (cervix) or womb proper (uterus) requires special local treatment by an experienced veterinarian. In other cases growths in the vagina, or an abnormally closed, hardened, or twisted condition of the cervix require the attention of the expert. Fat cows need reducing and thin building up to establish conditions favorable to conception. Until a veterinarian can be employed flush out the vagina of each cow three or four times a week with a gallon of blood warm boiled water containing two tablespoonfuls of pure phosphate of soda.

Aldebaran Dispersal Sale!

77 Registered Ayrshires

ONE-HALF OF AYRSHIRE CLASS LEADERS IN WISCONSIN are in this herd and will be in the sale. Such a chance to secure FOUNDATION herd stock is seldom offered. BE THERE.

ALDEBARAN FARMS, RACINE, WIS., OCT. 2nd

BLOOD WILL TELL — Study this Pedigree:

Aldebaran Victor
Sept. 15th, 1920

Friendlesshead Victor (Imp.)
- Netherton Viceroy (Half Bro. Netherton Crafty 5th Jr. 3, 12,533 lbs. milk—4.11% fat.)
  - Rrae Rising Star (Champion Scotland, 1911-12)
  - Netherton Queen Victoria 3rd (3 yr.—9,470 lbs. milk—3.87% fat)
- Friendlesshead White Lily. 4 yr. old record 10,290 lbs. milk—3.96% fat)
  - Friendlesshead Sir Robert (Half Bro. Brae Rising Star)
  - Friendlesshead Lily. 11,990 lbs. milk—3.85% fat.

Highland Polly A. R. No. 1,681 (Sr. 3-15,715 lbs. milk—4.05% fat.)
- Baron's Best of Bargenoch. A. R. 126 (Half Bro. Gay Cavalier)
  - Bargenoch Durward Lily
  - Bargenoch Snowdrop 3rd. (Dam of Bargenoch Magnificent)
- Polly Puss 2nd.A. R. No. 354 (Jr. 2, 11,060 lbs. milk—4.17% fat)
  - Finlayston (Imp.) A. R. 30
  - Polly Puss A. R. 133 (12,632 lbs. milk—3.97%fat)

A FORTUNE. This bull is only FOUR years old. He combines unexcelled show type with a wonderful production pedigree. He will make a fortune for the breeder who proves out his daughters successfully. His dam, HIGHLAND POLLY, sold for $7,500 at the National Ayrshire sale 1919.

EIGHT HALF SISTERS. Eight cows by Friendlesshead Victor will be in the sale. One of them, Aldebaran Bess, has made a record of 12,193 lbs. milk—3.61 per cent fat. Still another half sister, Aldebaran Annabelle, now owned by the University of Wisconsin, recently finished a record of 11,546 lbs. milk and 461.89 lbs. fat, making her state Ayrshire champion senior 2-year-old, 300-day division.

ELEVEN DAUGHTERS. Eleven daughters of ALDEBARAN VICTOR will be in the sale. Of these three are bred and safe in calf.

SEVEN SONS. Seven young bulls, all the get of ALDEBARAN VICTOR, will be offered. ALDEBARAN TIP TOP (out of Springbrook Milkmaid) now ready for service, almost pure white, is one of the handsomest specimens of the breed that we have ever seen.

TWENTY-SEVEN cows and heifers are bred to ALDEBARAN VICTOR, all safe in calf to the best of our knowledge and belief. This good blood is widely distributed. Now is your chance to get some of it.

BROWN SWISS

ANNOUNCEMENT

KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Herd fully accredited, Certificate number 65301

DISPERSAL SALE!

Egypt Mills Guernsey Club

Cape Girardeau, Mo., October 7-8

The Egypt Mills Guernsey Club is a corporation founded in 1919 to develop and promote the breeding of pure-bred Guernseys in Cape Girardeau Co., Missouri. The cattle used as a foundation were imported from the Islands and purchased in Wisconsin. The contract on which the cattle were placed with the farmers called for the dispersal of the entire foundation and increase at the end of five years' time. The five years is up and the cattle will be offered for sale at above named time and place. Included in the lot are many cows with A. R. and Cow Test records, many cows untested but capable of large records, 20 or more young bulls and a large lot of fine heifers.

The club was most fortunate in securing as a herd sire Eminent of Sarnia 32963, one of the great sires of the breed whose first 9 daughters tested averaged 566.6 lbs. fat in classes GG, G, G, EE, E, E, FF, D, and D. One of these sold for $5,000. There are over 70 daughters of Eminent in this sale, and most of the heifers not his daughters are his granddaughters.

Eminent of Sarnia will be in the sale, and is in fine condition and a regular breeder. This will be a wonderful opportunity to pick up foundation Guernseys that you know will be great producers.

Contentment on the Farm

(Continued from first page)

things. I call a stone or rail fence far more attractive from a beauty standpoint than any that is made of iron. A weathered log is by no means unattractive and you would not dream of painting it. I have seen weathered buildings that were frightfully ugly and others that were attractive. The same remarks would apply to those that were painted. A well dressed woman is dressed in an inconspicuous manner. She is natural, there is nothing sensational about her. So I think that the Crimson Ramblers, because they are sensational, are worse than failures, in large numbers at least. Along my fences I am content to see the trees of my own country grow, and if the brown eyed susans, hazel nut, and wild strawberry accompany them, I am the more content. If a hawthorn is there, so much the better, for maybe the birds will like the combination.

As to the grass in your lawn, I like it far better when it isn't cut than when close shaven. Trees I would have, the more the better; big, stately, rugged ones in natural groves. It would not hurt to have both deciduous and evergreen sorts and the smaller but graceful shrubs and bushes beneath or around the big fellows. If some produce seeds for the birds, so much the better, and if some wild flowers come in, that is also good.

The reason why some of us are contented may be because we have so many of these beautiful forms of life around us. If all of us would think about the matter a little, I believe that wonder and gratitude for these things would fill our very souls.

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

6 GRAND CHAMPIONSHIPS—12 CHAMPIONSHIPS — 54 FIRSTS

Our young stuff by our herd sire, FINANCIAL BEAUTY'S KING, 132904, Silver Medal Sire, has done exceptionally well.

We have some bull calves by this sire — also some by FASHIONABLE FERN LAD, 163968, twice Grand Champion at the National Dairy Show and winner of numerous other championships—that we are offering for sale at very reasonable prices. Some of them are out of dams with good Register of Merit records.

These calves will win for you, not only in the show ring, but by increasing the production of your herd.

Write us for a descriptive list with prices.

Meredith Jersey Farm
Des Moines, Iowa

For Sale

National Dairy Show Sale
Grade HOLSTEIN, GUERNSEY and JERSEY COWS with
Cow Test Association or Semi-official Records
National Dairy Show, Milwaukee, Wis., Sept. 30, Oct. 1-2, 1924

Every cow consigned must have a C. T. A. or semi-official record of at least 250 lbs. fat as a two-year-old or of at least 350 lbs. if 3 years old or over.

All will be tuberculin tested just before sale by competent veterinarian and all will be examined by a competent veterinarian just before sale and his statement of condition of pregnancy will be announced at time each cow is sold. It is expected that there will be 200 head of these cows and bred heifers sired by pure-bred bulls out of C. T. A. cows.

Committee in charge of the sale is Charles L. Hill, W. L. Baird, and Glenn Vergeront.

some "Alfalfa Logic"

Let these facts aid your search for lower operating costs

NO farmer expects a profitable stand of alfalfa from thin or acid soils. Sour land may be all right for soy beans and alsike, but all wrong for alfalfa. Likewise, the wrong oil in a motor will give results just as unsatisfactory.

Motors are just as different as soils; just as different as live stock. There isn't any problem on the farm that requires more individual treatment than the lubrication of gasoline motors. Proper lubrication is real economy. Improper lubrication is added expense.

Just because the differences in oils cannot be seen, do not be misled into buying cheap oils. Don't make the mistake of using an oil of wrong body and character. Your *motor* can tell the difference instantly. So can you—in the long run. A single unnecessary repair bill, one part prematurely worn out, and all you've "saved" on cheap oil "goes up in smoke." ***Mobiloil is the cheapest oil at any price.***

Why Correct Lubrication is the Cheapest

Gargoyle Mobiloil is not a gasoline by-product, as cheaper oils nearly always are. The crude stock from which it is made is chosen solely for its lubricating quality, not for its gasoline or kerosene yield. Every batch of Mobiloil is tested to assure its constant high standards and uniformity.

The Vacuum Oil Company has specialized in *correct lubrication* for over 58 years. It maintains a Board of Engineers—twenty-three men who spend all their time analyzing motors under every conceivable operating condition. The one purpose of their work is to determine *the* oil which will give greatest economy in every make and model of automobile, truck, or tractor.

The result is the Gargoyle Mobiloil Chart of Recommendations. For the cheapest lubrication at any price make the Chart your absolute guide. It is shown here in part. If your automobile, motor truck, or farm tractor is not listed in this particular Chart, see the complete Chart which hangs on the dealer's walls. Or write our nearest Branch for our booklet, "Correct Lubrication."

TRACTOR Lubrication

The correct engine Lubrication for the Fordson Tractor is Gargoyle Mobiloil "BB" in summer and Gargoyle Mobiloil "A" in winter. The correct oil for all other tractors is specified in our Chart. Ask for it at your dealer's.

GARGOYLE

Mobiloil

Make the chart your guide

Chart of Recommendations

(Abbreviated Edition)

THE correct grades of Gargoyle Mobiloil for engine lubrication of both passenger cars and motor trucks are specified in the Chart below.

How to Read the Chart: A means Gargoyle Mobiloil "A"; B means Gargoyle Mobiloil "B"; BB means Gargoyle Mobiloil "BB"; E means Gargoyle Mobiloil "E"; Arc. means Gargoyle Mobiloil Arctic

Where different grades are recommended for summer and winter use, the winter recommendation should be followed during the entire period when freezing temperatures are experienced.

The Chart of Recommendations is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and represents our professional advice on correct automobile lubrication.

Bigger Cream Checks with an Improved

DE LAVAL

Cream Separator

Thousands of users of the improved De Laval Cream Separators are being agreeably and pleasantly surprised at an immediate increase in the size of cream check or amount of butter money, after putting them to work.

De Laval Separators were always famous for doing that; that's why there are so many more in use. But the new De Laval will skim even cleaner and last even longer. See and try an improved De Laval—not one buyer in a hundred who does that can fail to choose the De Laval.

EVER FAILING OR NEVER FAILING PASTURE

Summer Key to Dairy Profits

Part 13.

WILBER J. FRASER, University of Illinois

THE object of the farmer is to make money. It is not to produce the greatest quantity of product possible, but rather to produce it in such an economical manner that he will make the greatest profit. If a dairyman could by any means go into the city and contract his year's supply of milk at 15 per cent above the market price, it would be hailed as a marvelous achievement and in most cases would more than double his profit. It would be practically impossible to raise one's selling price so greatly, but there is another way to increase his profit just as much—even to doubling it—and that is to reduce the cost.

It is neither impossible nor difficult to reduce the cost of production on the average dairy farm, and these articles have endeavored to make plain one of the greatest means of economy in dairy farming today. The problem of profitable farming is a complex one and holds many uncertainties. A number of the factors may seem quite beyond the farmer's control, or may take years of organized effort to yield him fair returns. But here within his immediate reach is a sure measure of relief. He can work it out unhampered in his own particular field and without going off his farm.

The men who are able to cut their cost of production the lowest without reducing either the amount or the quality of the product are the ones who will have the most left for profit after expenses are paid and they are the most successful. *The cost of production is equally important with the quantity of the product produced or the price received for it when it comes to determining profits.*

The Feed is Fifty Per Cent of Cost

Dairy farming involves so many operations that the cost of production is necessarily great, and since the feed cost for the year is over fifty per cent of the total cost of the milk, there is large opportunity for saving in this rspect. The saving of even a small percentage of this feed cost means a large saving in dollars and cents. And as the natural pasture season covers half the year, it is plain that a reliable, high yielding and economic pasture cuts a big figure in the year's feed and becomes a gigantic question in economic milk production. The search for such a pasture crop has been strangely overlooked by both dairymen and experiment stations.

Greatest Failure at Time of Greatest Growth

The failure of bluegrass pasture has been little realized. Men have thought that when cows were on pasture they were well fed. The green glamour of bluegrass in the spring invoke a simple faith that it will live forever. But the pasture experiment conducted at the University of Illinois and reported in the first of this series plainly shows the failure of bluegrass pasture the last two-thirds of the summer, and this agrees well with common farm observation. Our immense corn crop is practically produced in these three months, when the factors of nature are so combined as to make the greatest growth. But these natural forces of production go almost entirely to waste on bluegrass pasture at this time because it does not have the depth of roots to withstand dry weather. Therefore cows on bluegrass pasture, instead of being well fed *at this time of greatest natural production, in reality often suffer the worst of any time during the year from lack of feed.*

Blind to Striking Differences

Any dairyman can readily see and realize the difference between the empty manger or a manger with a spoonful of feed in it, and a full manger; but he does not see or realize the difference between a bare pasture of bluegrass and a bounteous pasture of the sweetest and never failing clover.

We have been blind to the difference between a cow filling herself easily in 20 minutes grazing, and her struggles to do the same thing in 20 hours grazing.

When we *have* seen the deficiency of bluegrass, we have gone in blind to make it up without any thought of the cost or of saving land and labor, or of supplying exactly what the cow needs to produce a liberal flow of milk and keep her in excellent health and vigor.

It's the Feed For Half the Cow's Life

The dairyman is driven to look for a pasture that *is* a *pasture. A real pasture is the dairyman's self-feeder.* We would use it for 12 months in the year if we could, but can expect the cows to harvest their feed in the open only half of the year in this latitude. No chances should be taken on the best and surest pasture for that 50 per cent of the time.

The perfect pasture feeds the cow for half her life. Sweet clover pasture comes nearer to filling the bill and filling the cow satisfactorily than any other found so far. It starts a strong, vigorous growth early in the spring, furnishes an even supply of feed throughout the summer by using the old and the new seeding, and it continues its growth in the autumn until severe freezing weather, producing the largest amount of feed per acre.

For the cow's yearly production, for herself as an individual, and for her future production, she must be well fed during this hot period of fly time. There is an advantage here beyond all the savings mentioned, and affecting the whole life and production of the cow. For in many cases the cows lose flesh and reduce their milk flow on short bluegrass pasture in the hot weather; they do not regain either loss in the fall and are in thin and poor condition when they go into the barn for the winter. Under such treatment they never come up to their natural ability and the loss in production extends over a much longer time than the two to four months of short pasture.

The Three-fold Saving

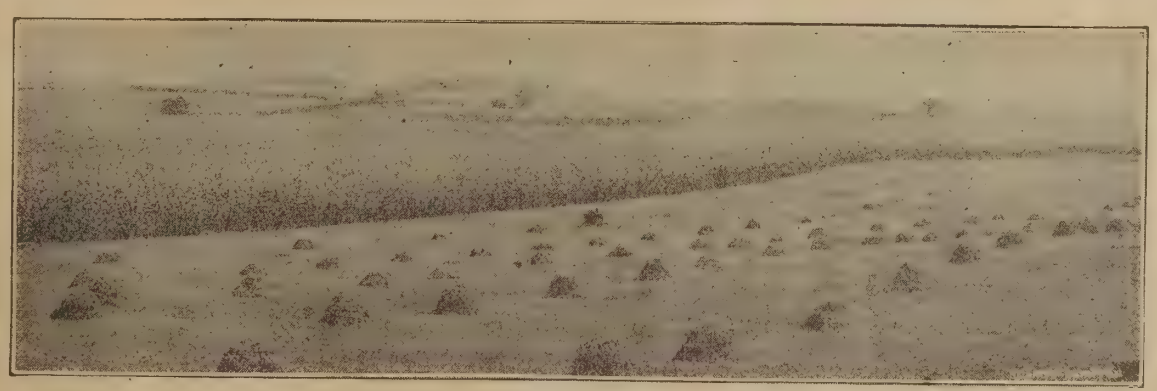
The hundred farmers who have had experience in raising this crop for pasturing dairy cows say that it will produce three times as much feed per acre as will bluegrass. Since three-fourths of an acre of sweet clover pasture and one-fourth acre of corn as a grain supplement will feed a good dairy cow six months, two acres of land are saved over the old system of bluegrass pasture and supplementary barn feeding. In addition it makes an equally great saving of labor in growing and feeding these supplementary crops.

Sweet clover pasture is not only a cheap feed but it is a good feed, furnishing all the requirements needed by the cow for the production of a good flow of milk, and with the addition of a little grain, all the requirements for a heavy flow of milk. It also keeps the cow in excellent physical tone.

This great combination of saving land and labor and cow is what gives sweet clover its great distinction as a pasture crop and in the realm of economy.

Greatest Gate Ever Invented

The manufacturer has striven for economy of production to the minutest detail in every branch of his busi-



(Continued on page 303)

The Best Feed Combination for a Dairy Herd

The crops and acreages shown below with some grain added for high producing cows furnish an abundance of the best and most economical dairy feeds for the entire year.

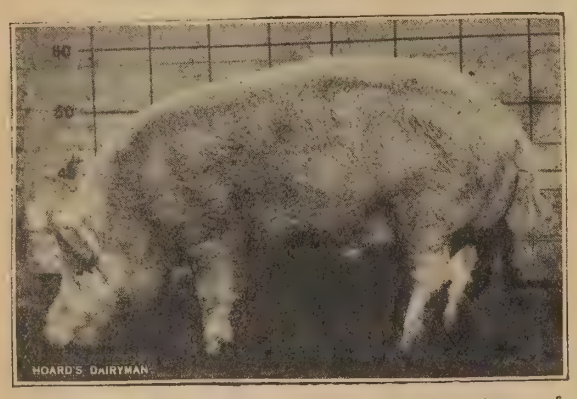
CORN FOR SILAGE AND ALFALFA HAY FOR THE WINTER SIX MONTHS—ONE-THIRD ACRE OF CORN AND ONE-HALF ACRE OF ALFALFA PER COW



FOOD VALUE OF SKIMMILK

Results of a Demonstration Which Showed Clearly the Wonderful Growth Stimulating Power of Skimmilk

O. E. REED, Michigan College of Agriculture

IN order to show the food value of skimmilk, Reed and Huffman of the Michigan Experiment Station planned a feeding demonstration with four pigs in September, 1922. These pigs were used for a demonstration during Farmers' Week at the college and at other dairy and farm meetings. The results are very striking and much interest has been manifested in them.

Four Yorkshire pigs (litter mates of practically the same weight) were selected for the demonstration. These were divided into two lots, Lot I and Lot II. The pigs were numbered as follows: Pig 1, Lot I—Pig 2, Lot 1—Pig 3, Lot II—and Pig 4, Lot II.

Pig No. 4 in Lot II weighed only 76 pounds at 1 year of age. At this time skimmilk was fed in place of minerals and 5 months later he weighed 350 pounds. Skimmilk brought about a complete recovery of growth which had been delayed for a period of 1 year, due to lack of growth stimulating factors found so abundantly in skimmilk.

Pigs 1 and 2 in Lot I were fed for a period of five months on shelled yellow corn and skimmilk. Pigs 3 and 4 in Lot II were fed on shelled yellow corn and water for the same length of time. Corn was fed in self-feeders and when skimmilk was included in the ration the pigs were allowed only the amount of skimmilk they would readily consume in two feeds per day.

The pigs were weighed every ten days. At the end of five months the pigs which had received shelled corn and skimmilk had made an average total gain in weight of 221 pounds, while the pigs on a ration of shelled corn and water had made an average total gain of only 9.5 pounds. The difference in weight of the two lots of pigs was due to the growing power of skimmilk. There was also a striking difference in the health and appearance of the two lots of pigs. The pigs receiving corn and water had an unthrifty, ill-kept appearance and manifested an abnormal craving for something not present in the corn and water, and whenever possible they would eat small rocks and cinders. On the other hand, the pigs that received skimmilk in addition to corn were the picture of health and appeared perfectly contented with the ration which they were getting.

After the first five months of the demonstration, Pigs 1 and 2 in Lot I were disposed of and Pigs 3 and 4 in Lot II were placed on an experiment to determine the effect of stunting on subsequent growth as well as to demonstrate further the value of milk as a food. Pig No. 3, which was seven months of age at this time and weighed only 43 pounds, was placed on a ration of shelled corn and skimmilk. Pig No. 4, which was the same age and weighed 48 pounds, was placed on a ration of shelled corn, water, and a complete mineral mixture. The reason for feeding one pig on a complete mineral mixture in comparison with the other pig fed skimmilk was to demonstrate the fact that minerals were not the limiting factor which caused the great difference between Lot I and Lot II during the first 150 days of the experiment. A diet of corn and water is low in minerals and such a ration is very low in protein. The skimmilk furnishes minerals, protein, and vitamins, all of which are essential for growth.

At the end of the second five-month period, the pig receiving skimmilk and corn had gained 307 pounds and had overcome the stunted condition in every way, while the pig which had received minerals in addition to corn and water had gained only 28 pounds. The marked difference in the growth of these two pigs again demonstrates the exceptional food value of skimmilk.

Pig No. 4 when twelve months old and badly stunted, as is indicated by its weight of only 76 pounds, was placed on a ration of shelled corn and skimmilk to determine if it was possible for such an animal to recover its growth. At the end of a further period of five months of skimmilk feeding, Pig No. 4 reached a weight of 350 pounds, a gain of 274 pounds, and appeared normal in every way. This gain in weight was not only a gain in body fat, but also a gain by growth of skeleton and muscle.

The following table gives the record of food consumed, weights, and cost of gains of each pig:

Ration	Lot I Pigs 1 & 2	Lot II Pigs 3 & 4
First Five-month Period		
Corn, 78c per bu.	14.1 bu.	9.6 bu.
Skimmilk, 35c per cwt.	5,356 lbs.	None
Total feed cost	$29.75	$7.49
Av. wt. at beginning, lbs.	37	36
Av. wt. at end, lbs.	258	45.5
Av. gain in weight, lbs.	221	9.5
Cost per pound of gain, cents	6.7	39.4
Age, mos.	7	7

Ration	Lot II Pig 3	Lot II Pig 4
Second Five-month Period		
Corn, 78c per bu.	8.1 bu.	5.5 bu.
Skimmilk, 35c per cwt.	5,297 lbs.	None
Minerals, 25 lbs. at 5c	None	25.0
Total feed cost	$24.85	$5.54
Weight at beginning, lbs.	43	48
Weight at end, lbs.	350	76
Gain in weight, lbs.	307	28
Cost per pound of gain, cents	8.0	19.7
Age, yr.		1

These two pigs are brothers from the same litter. The large pig, No. 1 in Lot I, received skimmilk and shelled corn, while the small pig, No. 3 in Lot II, received water instead of skimmilk. Skimmilk made the difference.

Ration	Lot II Pig 4
Third Five-month Period	
Corn, 78c per bu.	14.4 bu.
Skimmilk, 35c per cwt.	2,526 lbs.
Total feed cost	$20.07
Wt. at beginning of this period, lbs.	76
Weight at end of this period, lbs.	350
Gain in weight, lbs.	274
Cost per pound of gain, cents	7.3
Age, mos.	17

These two pigs are full brothers from the same litter. Both were stunted up to 7 months of age on corn and water. At this time the big pig, No. 3 in Lot II, was fed skimmilk in place of water. The little pig, No. 4 in Lot II, was fed a complete mineral mixture in addition to corn and water. Skimmilk produced a wonderful recovery of growth in the large pig. The small pig failed to grow because of a lack of protein which would have been supplied by skimmilk.

Summary

This demonstration shows clearly the wonderful growth-stimulating power of skimmilk.

The addition of skimmilk to the ration of stunted swine not only showed the food value of skimmilk but also demonstrated that animals will recover from retarded growth due to faulty nutrition, if the proper food is furnished in sufficient quantities before the growth impulse ceases.

Milk is almost a complete food, furnishing energy in the form of fat and sugar, a muscle building material in the form of an adequate protein, all the recognized growth and health regulators known as vitamins, and a complete mineral combination for bone building.

Farmers Kill Garlic

That the fall plowing or cultivation method of destroying wild garlic is successful in practically all cases in which the work is carefully done, was further indicated by a recent check-up among farmers who have practiced this method in Knox County, Indiana, according to a statement recently issued by A. A. Hansen of the Purdue University Agricultural Extension Staff.

J. B. McCarty started the method three years ago on a 22-acre field heavily infested with garlic. In spite of the fact that the work was seriously interrupted one season on account of weather conditions, most of the garlic has been eradicated. McCarty plowed the infested field during the fall of 1921, plowing again the following spring. This was followed by corn and the fall plowing was continued during 1922. At present the field is in soy beans.

Nolan McClure succeeded in eradicating a bad stand of garlic by two years of fall and spring plowing, using cowpeas during the summer and rye in the fall. His results were exceptional since at least three years are usually required to destroy wild garlic by this method. The cultivation method consists essentially of fall plowing during November in such a manner as to turn the garlic plants completely upside down, followed by spring plowing and a cultivated crop such as corn, cowpeas, or soy beans, either in rows or broadcasted.

The use of an oil spray for small patches was successfully practiced by B. F. Nesbit, who cleaned out a number of patches on a ten-acre field by spraying with crude oil. In order to get results, it is necessary to apply the oil between mid-April and early May. Further information regarding methods of eradicating wild garlic may be secured by addressing the Purdue University Department of Agricultural Extension, Lafayette, Indiana.

Harvesting Soy Beans

HOARD'S DAIRYMAN:—R. H. Moellering of Clayton County, Iowa, harvests his soy beans with a binder. For seed purposes he waits until the soy bean pods are nearly ripe and about three-fourths of the leaves have fallen off. He makes small bundles, setting them up six or eight to a shock. After they have dried for a week he threshes them with a grain separator, removing the concave and replacing with a blank or a heavy board. They are more easily threshed when a trifle damp, he says. This will keep many of the beans from being cracked. However, it is necessary to spread them out on a floor after threshing to keep them from heating and coloring. They should not be more than six to ten inches deep, either. He recleans them after they are well dried by running them through a fanning mill, taking out all the oversized and cracked beans and feeding them to the hogs as a tankage substitute.

Iowa. A. M. WETTACH.

"All men cannot be *the* best, but every man can be *his* best!

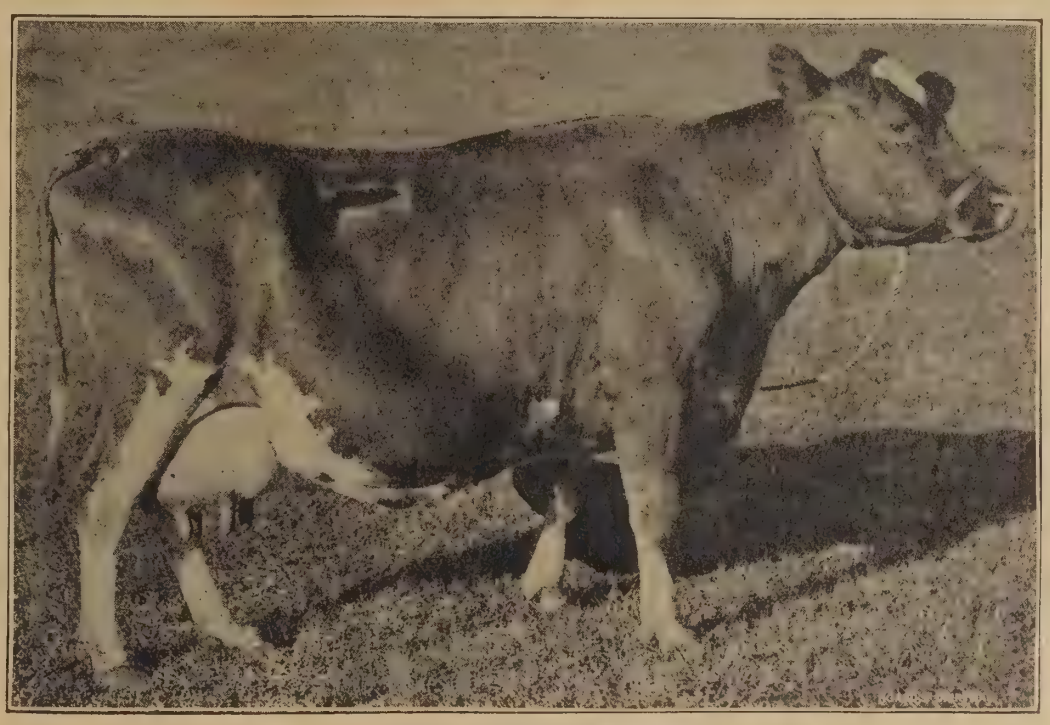
GLENWOOD'S MISS GRETA AND HER FAMILY

LESS than nine years ago, Glenwood's Miss Greta, a Guernsey, was without a permanent home, and Mrs. Oviatt, the wife of the late Dr. Oviatt of Wisconsin, asked for her and her yearling daughter the sum of $500. She was advertised for sale, but no one seemed to want her for her value as a breeder and a producer was unknown. She was offered to Mr. L. B. Stevens, owner of Shoreland Farm, of Wisconsin, and he purchased her, little realizing the bargain he had made when he took her home.

Glenwood's Miss Greta was born October, 1908, and has an outstanding record both in production and reproduction. She has twenty-nine descendants and they were all bred and raised, with the exception of one, at Shoreland Farm in the past nine years. Her descendants consist of six daughters and one son; twelve granddaughters and one grandson; six great granddaughters and two great grandsons and one great great grandson.

Greta, when 6½ years old, was purchased by the Shoreland Farm, Waukesha Co., Wis., in June, 1915, with her last calf, a yearling daughter. She was not in calf at that time. A note of $500 was given in payment for her and it was understood that she was to be paid for with what she produced. The note was redeemed in two years. She has had eight calves in the past nine years. Seven are on Shoreland Farm and one, Shoreland King, an Advanced Registered bull, is the herd sire of Chestermont Farm, Pennsylvania.

It should be noted that in these nine years every heifer calf that was dropped lived and all have been kept in the herd. Every one of her calves has been an exceptional producing animal and of good type. There has been no culling out of her family, or has there been any black sheep among her children. It should be noted how uniform in shape are the udders of these animals, how well the teats are placed, and the strong dairy talent expressed in every one. They all have great capacities, are strong, vigorous animals with good length and depth of bodies, well veined, and good top lines. In short, they all show exceptional dairy talent. Old Greta, herself, after fifteen years of steady working, has an unusual dairy conformation and shows wonderful dairy talent. The length of time she carried her calves in the years she produced her big records will be noted in the explanatory paragraph under the half-tone of Miss Greta.



Eleven records produced by herself and the members of her family have averaged 544 lbs. of fat in a year. The best record is by one of her daughters, Guinan's Beauty, that produced 16,555 lbs. milk containing 823 lbs. fat, at the age of nine years and eleven months. Greta's fifth daughter freshened at the age of two years and has produced in 200 days 308 lbs. fat and she has still 165 days before the year is completed. A great granddaughter now on test has made in 145 days 233 lbs. fat. Glenwood's Miss Greta at the age of fifteen years has made in 139 days 245 lbs. fat.

This cow of unusual dairy talent and reproduction and 24 of her female descendants are on exhibition at the National Dairy Show in Milwaukee which begins Saturday, September 27th, and continues until October 4th.

It is an unusual incident when a cow can show twenty-nine living descendants and herself still in good vigor and capable of a high year's record. We have no definite information why some cows will live to be fifteen to twenty years of age and produce strong, vigorous calves each year and do unusually well at the pail. Some cows are old at the age of ten years and have finished their work, but a few will continue beyond this time and without any indications of growing old. There is something about the cells of such animals that are different than the average. Just why the cells of certain cows are capable of carrying on their work for twenty years and others for only ten has not been revealed. We do know that the master breeders have found such animals and have been able to concentrate and perpetuate their blood. There is no breed that has not had some such animal which has contributed substantially to its welfare.

It may be said further that the owner of this cow fed, cared for, and milked her. She has not been forced in her work, for if she had been it is very doubtful if she would be such a regular breeder or would have produced such strong, vigorous calves.

An exhibit of this character inspires thinking and should lead breeders of all classes of live stock to watch out for such blood which should be concentrated and perpetuated in a large number of animals. In other words, let us be alert to the Shakespeares of our dairy animals.

GLENWOOD'S MISS GRETA 29218

8,285 POUNDS MILK, 440 POUNDS FAT AT 2 YEARS—241 DAYS IN CALF
10,474 POUNDS MILK, 516 POUNDS FAT AT 10 YEARS—286 DAYS IN CALF
12,121 POUNDS MILK, 642 POUNDS FAT AT 13 YEARS—288 DAYS IN CALF

This last record is the highest record of the Guernsey breed for this age. Miss Greta is again on test at 15 years of age and in 139 days has produced 240 pounds fat. She was bred May 14 and is considered safe in calf at this time. She is shown again below, at the extreme right of the upper panel, together with 29 of her descendants. The eleven records made by Miss Greta and her descendants average 544 pounds fat, the best record being 823 pounds fat produced by her daughter, Guinan's Beauty.

A HERD OF THIRTY HEAD FROM ONE COW IN NINE YEARS' TIME

This year at the National Dairy Show The American Guernsey Cattle Club will have as one of the feature exhibits the Guernsey cow, Glenwood's Miss Greta 29218, and her 29 descendants.

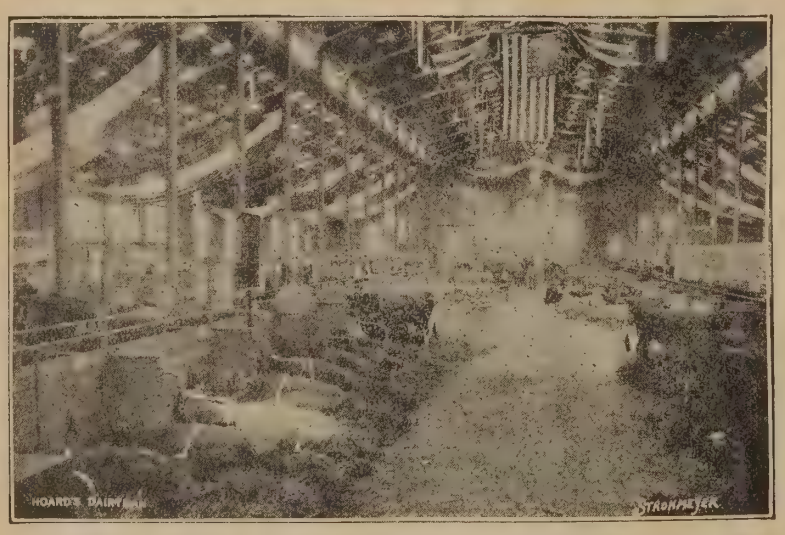
CHILDREN, OUR GRANDEST CROP

And What the Good Schools of Today Mean to Them and to Agriculture

JOE ALEXANDER, WISCONSIN

THE children of today are the men and women of tomorrow. The little ones that are growing up on our farms now will be responsible for the future of agriculture. To them we must look for future leadership. This has always been true, but until lately the fact was not freely admitted. Only within recent years have farm children come in for their fair share of educational attention. Now, at last, the training of rural children has been placed upon a sound basis. Now we find good schools that really teach not only the essential subjects but modern applied science intended for practical application to farm problems—for this is demanded by parents in every forward-looking community. The "little red schoolhouse" and the one-room log school where the "3 Rs" were taught to the tune of the teacher's ruler is now a thing of the past.

In its place we find well lighted, well ventilated, roomy, sanitary, modern schoolhouses appearing in small villages and even at the cross roads in the country. Consolidated schools with even better and more complete equipment, operated under the supervision of capable teachers, now attract children from longer distances through the medium of school busses. Rural high schools wherein boys and girls are taught live stock care and management, poultry husbandry, soil management, and crop handling, agricultural botany, farm accounting, shop work including carpentry and blacksmithing are now meeting a long felt rural need. For the girls there is cooking, dressmaking, millinery, home decorating, farm health and hygiene, kitchen, gardening, and business management of the farm home. These subjects train the sons and daughters of farmers for the work they will do when they grow up if they stay on the farm. But is that all? No, they do much more. They awaken in every child an active interest in farm work, farm facts, and farm possibilities for profit that is bound to show a marked tendency on the part of those so taught to remain on the farm. Do farmers ever look at the matter in that light? They should. For, if farming is to successfully compete with the lure of the city, farmers themselves must see to it that their children are enabled so to study, so to fit themselves, and so to arrange their day dreams of the future that in every dream picture, every hope, every budding ambition, the farm is always kept in the foreground. But how can that end be accomplished?



Visit your school. We are willing to wager that not one farmer in ten, perhaps not one in fifty, ever visits the school that his children attend—unless it is when "Maw drags him along to graduation exercises". There is no job that will pay him better than to visit the school, get acquainted with the teacher, see how work is conducted, and how the pupils spend their time. The day is long gone when any farmer can afford to take schools for granted, as he does taxes, election day, and the seasons of the year. The teacher will appreciate the interest you show by making her school a visit. She is doing her best, too often without co-operation, to make her school the very best in the country. She is, as a rule, the most patient, conscientious, underpaid worker of all our nation's salaried wage earners. The country's future citizenship rests in her two little hands. Tied, though they may be by "red tape", quarrelsome school boards tainted with politics or prejudiced and biased by antiquated theories of education, and laboring along on her own inadequate salary, she nevertheless is doing a wonderful work. She is trying to hold her pupils through interest, not through their fear of the hickory stick or the more recent truant officer. When she needs new equipment for this or that, don't turn a deaf ear, then wonder why your children's interest lags. You are not mowing your hay and reaping your grain with a cradled scythe—but grandpa did. No, you have advanced, admitting that times and conditions are changing.

Times have changed in education, too. Changed conditions require more and better "machinery" for school work. See that it is provided. Authorities on the subject tell us that each day's work in school is worth $10 to the pupil. With forty children in her school, see what a load of responsibility each teacher carries every day of the school year! How much more could every child's day be worth with every condition at its best?

The entire school system is in a state of growth. Great changes are coming fast, but all such progress depends upon the intelligence of the public, upon your home folks in every school district. Keep "posted" on school matters. Visit your school. Assure the teacher that you are in sympathy and accord with her ideas, her ideals, and her best efforts. Promise her your wholehearted support wherever the best interests of the school and its pupils are concerned, then give the support you have promised. Do it whether you have children or not. That is good citizenship. Do not wait for somebody else to take the lead; it may never be taken. Remember that better education is the purchase price of better future agriculture.

GRAND CHAMPIONS AT MICHIGAN STATE FAIR

The Diamond Anniversary of This Fair Was Celebrated at Detroit

Dairy-men are Business-men

HOARD'S DAIRYMAN has a circulation of over 100,000 distributed among the several states of the Union, and it is devoted almost exclusively to the Dairy interest. A survey of its subscribers made some time ago, showed that 96.56 per cent carried bank accounts; that 92.13 per cent paid their bills by checks; that over 33 per cent owned typewriting machines; that 88.2 per cent owned automobiles and that of those who owned autos 87.27 per cent paid cash for them.

Furthermore, the survey showed that the average acreage of their farms was 164.95 acres, of which 129.61 acres were improved; that the average value was $162.28 per acre, exclusive of buildings; that the average investment in farm buildings was $8,671.56; in farm machinery, not including tractors, trucks or automobiles, $1,670.13; in dairy herds, $3,362.58; in all stock, $4,663.48, and that the average total investment per farm was $26,769.81!

The average gross yearly income was $6,346.23 whereas the average yearly expenditures were found to be $4,268.69, leaving $2,077.54 as the average net income.

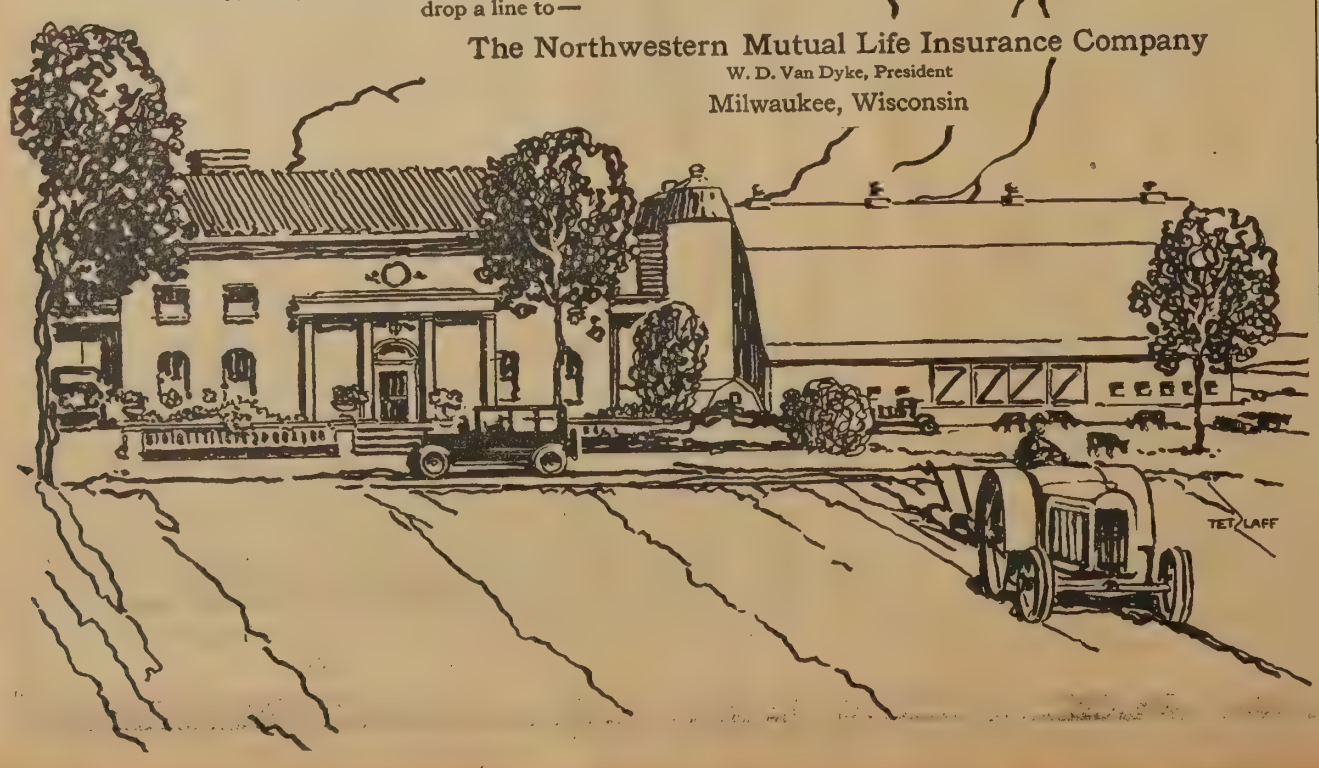
Equally as interesting but perhaps more significant was the fact that 67 per cent of them carried some form of life insurance and that of those insured, 64.26 per cent *carried old line life insurance!*

The foregoing shows that the dairyman of today is not only a business man but a thinking man. He realizes that the future of most American families is in the productive hands and brains of the head of the family, and particularly the dairyman's family He feels that there is something more than an obligation on his part as a husband and father He has attained to the dignity and worth of a merchant or a manufacturer and he has an economic responsibility which he ought to heed He has no more right as a citizen to leave his producing business to an uncertain future than he has to leave his family in poverty.

When the head of a dairy farm dies, the breath of the business stops. Both his family and the farm need funds to tide them over until new hands, new brains, new plans and new energy can help them, and the only definite and absolutely sure medium by which this can be accomplished is *Life Insurance.*

As a dairyman, as a business man, as a citizen and as a husband, he must carry Life Insurance to protect him in all of his obligations and duties.

The Northwestern Mutual Life Insurance Company of Milwaukee, Wisconsin, long and familiarly known as the "Farmers' Friend" because of its business policy of loaning funds to farmers, — for more than 66 years has devoted its best thought and energy to the perfection of life insurance contracts which exactly meet the requirements of the farmer in his desire to protect himself, his business and his family. These contracts are perfected to the minute and should be examined into by every Dairyman in the United States. The Northwestern maintains agencies in every community in the healthful parts of this country and its representatives will be glad at any time to explain these modern, protective policies to all who inquire about them. The agents of the company are trained for Service and they are pleased to render it.



If you find there is no representative of the company in your immediate vicinity, and you are interested,

drop a line to—

The Northwestern Mutual Life Insurance Company

W. D. Van Dyke, President

Milwaukee, Wisconsin

Consumption of Dairy Products

The increasing importance of dairying in the United States as a source of the Nation's food supply is strikingly brought out in a study just completed by T. R. Pirtle of the United States Department of Agriculture. The per capita consumption of milk and cream has increased about 12 per cent during the past ten years, and per capita consumption of butter has increased more than 6 per cent.

Special efforts have been made by the department during the past two years to obtain data on the consumption of dairy and poultry products on farms. Based upon reports from 30,000 township crop reporters in all parts of the country it is shown that the per capita consumption of milk and cream on farms is much larger than in cities. The average per capita consumption on farms with cows last year was approximately 81 gallons, whereas the average for the entire country was only 53 gallons. Average consumption of milk and cream on farms ten years ago was only 72 gallons.

Farm consumption of butter has also increased greatly, being now more than double the average for the United States. Per capita consumption of butter on farms last year is placed at 38 pounds as compared with an average of 17 pounds for the country as a whole. This farm consumption shows an increase of over two pounds per capita since 1913

The average person on farms also eats about one case of eggs a year, and about one fowl per month, Mr. Pirtle says.

Holsteins in Advanced Registry

A total of 20,030 pure-bred Holstein-Friesian cows now have completed yearly production records in the Advanced Registry of the Holstein-Friesian Association of America with an average of 15,603.2 lbs. milk and 528.49 lbs. butterfat, equivalent to 660.6 lbs. butter, according to the report of the superintendent of Advanced Registry for the last fiscal year recently closed.

The average yearly production for 7,109 full-age cows is 17,548.2 pounds milk and 742.9 pounds butter; for 1,445 senior four-year-olds, 16,540.7 pounds milk and 697.3 pounds butter; for 1,605 junior four-year-olds, 16,011 pounds milk and 678.4 pounds butter; for 1,773 senior three-year-olds, 15,444.3 pounds milk and 651.7 pounds butter; for 1,993 junior three-year-olds, 14,531 pounds milk and 614.5 pounds butter; for 2,312 senior two-year-olds, 13,971.7 pounds milk and 591.7 pounds butter; and for 3,793 junior two-year-olds, 13,060 pounds milk and 555 pounds butter.

Of these 20,030 cows 84 hold yearly records of over 1,000 pounds butterfat or 1,250 pounds butter, and 56 have in 365 consecutive days produced over 30,000 pounds milk.

The seventh enlarged edition of Decker's book, "Cheesemaking" has been revised by Prof. J. L. Sammis of the Wisconsin Dairy School. This new edition is largely rewritten and contains much new material relating to the cheese factory management, cheesemaking cost, cheese yield, and modern methods of making all kinds of cheese. It is for sale at this office for the sum of $2.25.

Liza—Dat certainly is a beautiful engagement ring. What size is dat diamon'?

Rastus—Dat is de 20-year instalment size!

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

A Cuban on the T. B. Test

HOARD'S DAIRYMAN:—It used to be the common saying (and is yet for all I know) that there were two subjects that could not be discussed fully and freely without starting a fight, to wit: politics and religion. In these hectic days, I am of the opinion that there are two more, T. B. testing and the pool. The latter is a sectional affair, so we'll dismiss it at the start, but I'll chance the former, as it vitally affects all dairymen today.

In your recent issue of the eighth, "Dozen Reasons Against T. B. Testing by Illinois Dairyman", I am inclined to think there is a lot of truth in what he says. Have been a reader of your paper for a matter of four years, so considering that this is a dog-goned short time to even figure on qualifying as a debater, shan't contradict a thing in no way whatsoever, but will base all suppositions on what I have observed in New York (southern section).

Have been given to understand that some bovines are so far gone with the disease that they fail to react to any of the three tests and "Illinois Dairyman" has evidently borne out that statement with reference to the animal that was shipped to the Yards at Chicago for beef purposes.

Possibly the T. B. test is O. K. but what riles me is, why under the canopy of heaven, isn't full publicity given so that the prospective applicant will get a fair idea of what he will eventually run up against? When a fellow signs an ordinary contract, if he's wise, he reads it over carefully; that is we suppose he does, if he's going to protect his bank account from any great raid thereon and he knows that it will probably be a gamble as the other fellow or party of the first part is probably out for blood or all that there is in it. But, when the victim reads over the proposed agreement for T. B. testing he could read it from now until "the sands in the desert grow cold" and I seriously doubt if the keenest minded man in the game today would have even a faint idea of what he is up against.

Dairying, as I view it, is too chuck full of present problems and possibilities for the average man to see or attempt to look into the future. The man who is well fixed with this world's goods can afford to stock a farm with high priced animals, either grades or pure-breds, and can sign up for the test and take the consequences without batting an eye, but how about the fellow of limited means whose very existence depends on what he can get from his cows twice every twenty-four hours in order to hold body and soul intact? That, gentlemen, is something else again!

In some sections of Southern New York, the dealers in cows are very much against the test and should a fellow sign up, he's taking an awful chance if he buys any stuff from them doing so deliberately, knowing that possibly they have come from another section where testing simply isn't done. And thereby hangs a tale.

Wisconsin, as every dairyman knows, (if you can make him admit it) is the cleanest state in the union today, but it seems to me that those who have retired from the game in your state are selling off their animals on that reputation and them to be trying to gouge as deep as they can for that reason. I've seen ordinary black and whites from your state shipped in and sold for (or rather the price demanded and got) $175 to $200 and this, mind you, in the trying days of '21 just after the big crash! Simply because they were tested stuff. If that isn't hogging it all around, then please tell me, what is it?

Is the "prospect" ever told that the present appropriation is exhausted and that there will be nothing doing until a new one is made? Not by a darn sight! Even the famous old Latin phrase of *"Caveat Emptor"* seems to be used to good effect by our paternal governments (federal and state). All right, let's proceed: A part of the dairy is condemned as being reactors and are shipped off to market and papers are signed and sent off to the Department and in the meantime we will suppose that the victim is looking around for tested stuff to replace what has been lost and possibly in a week's time comes word from the Department that the present appropriation is exhausted and it will be necessary to wait until a new one is made. Bam! and the game is on! That is what I feel safe in stating is plain h—l and repeat! And that is one reason in my mind why so many honest to God farmers are forced to the wall. All of which would probably not have happened had full publicity been given in the first place. It's all very well to tell what advantages will accrue from the testing and where it will eventually land a fellow, if he can weather the gale (but that part is never mentioned), but why in thunder aren't the appropriations made sufficient to cover all indemnities, or limit the work to compare with the appropriation in force?

For those delivering to a fluid market, if the pasteurization does away with all chances of the germ living (and I'm including the T. B. germ, also) then why should the fluid man fall for this and if pasteurization fails to eliminate this germ, then why pasteurize unless there are other pathogenic germs of equal danger?

Now, gentlemen, your paper appeals to me as one that is about the best informed one in circulation today and read by the better class of dairymen, so it puts you strictly on the fence if you will open your columns to both sides of the question for a full, free, and frank discussion of the whole business. Line up eminent authority, pro and con, and let's have it out and see what your readers have to say.

Cuba. K. D. WASHBURN.

Single Tax

HOARD'S DAIRYMAN:—Why single tax? Single tax is contrary to our fundamental laws unless the strangle holt of unjust assessments on the home owner be considered so. It is that which takes the very foundation from the home on the material side taxing homes in effect and nothing else, they being the only thing that cannot and will not escape it. Great wealth does not bear its equal share of taxes now. Under single tax wealth would not pay one-tenth the tax it does now. The rest would be laid on the laborers' and farmers' homes. The poor hovel would pay the same tax as the mansion next door, even though the latter's income was a million dollars to the farmers' one.

Michigan. R. W. STEED.

Geo. W. Cook Farm, Dover, Kansas

Painted White

Barn, house and everything on the Geo. W. Cook farm at Dover, Kansas, are painted a glistening white with Eagle White Lead in Oil. The Cheuvront Lumber Company of Dover, furnished the lead and report that all concerned are better satisfied than with any other white lead that they have ever used.

The long continued whiteness and long life of buildings painted with EAGLE White Lead are due to the Old Dutch Process of manufacture. They are developed by the slow, sure process of corrosion, during the 90 days that Eagle White Lead is forming in the corroding pots in the tan bark beds.

Send for the Farmers' Eagle

The Old Dutch Process is described in detail in the Farmers' Eagle, a complete guide for farm painting, written by a paint expert who grew up on the farm.

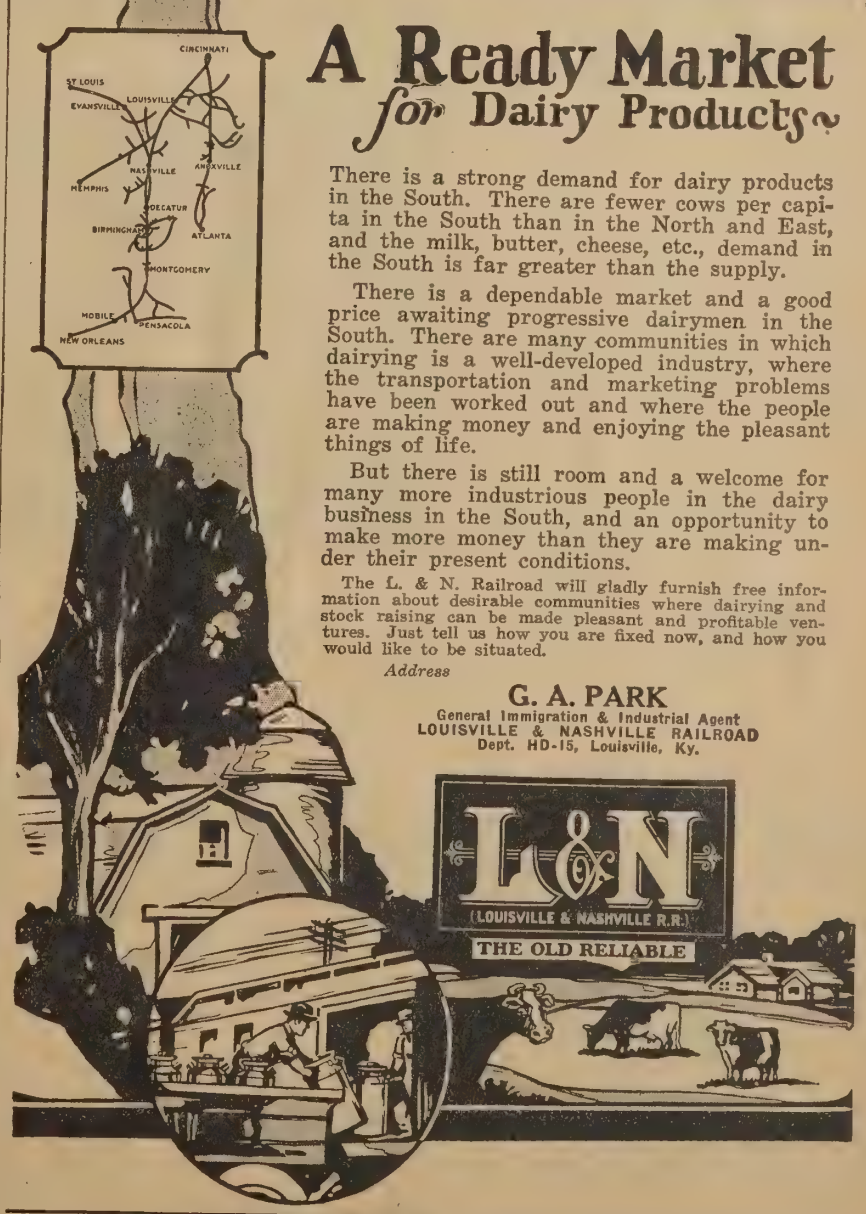
A Ready Market *for* Dairy Products

There is a strong demand for dairy products in the South. There are fewer cows per capita in the South than in the North and East, and the milk, butter, cheese, etc., demand in the South is far greater than the supply.



There is a dependable market and a good price awaiting progressive dairymen in the South. There are many communities in which dairying is a well-developed industry, where the transportation and marketing problems have been worked out and where the people are making money and enjoying the pleasant things of life.

But there is still room and a welcome for many more industrious people in the dairy business in the South, and an opportunity to make more money than they are making under their present conditions.

The L. & N. Railroad will gladly furnish free information about desirable communities where dairying and stock raising can be made pleasant and profitable ventures. Just tell us how you are fixed now, and how you would like to be situated.

THE MARYLAND STATE FAIR

HELEN OF SEIBERLING FARM, JUNIOR CHAMPION GUERNSEY COW
OWED BY GERAR FARM, MARYLAND

SECRET OF CRANE FARM, SENIOR AND GRAND CHAMPION GUERNSEY COW
OWNED BY GERAR FARM, MARYLAND

BUNTONHILL MABEL CHANCE, SENIOR AND GRAND CHAMPION AYRSHIRE COW AT THE MARYLAND AND NEW YORK STATE FAIRS
OWNED BY ALTA CREST FARM, MASSACHUSETTS

MARYLAND farmers are beginning to realize that the annual fair at Timonium is well worth their patronage. Being situated right in a horse loving country, a majority of the people that passed through the gates during the first five days of September spent most of their time in the vicinity of the race track. However, the interest in the judging of the four dairy cattle breeds was very intense and lasted from early morning until each day's work was finished. Many of the exhibitors were from distant states and the attention shown in their cattle by both the spectators and the management was very pleasing.

Nearly five hundred head participated in the open classes and the animals of the boys' and girls' calf clubs brought this figure up to nearly six hundred. Well fitted cattle were by far in the majority. The cattle that were brought to the grounds direct from their homes in many cases indicated that they were in their "working clothes" but the good judges had little difficulty in comparing their type with the highly fitted animals.

The dairy cattle exhibit at Timonium is improving, and the attention given the fair every year by real farmers and breeders bids fair for a show that will demand still greater appreciation in the future.

THE WINNING BOYS' AND GIRLS' JUDGING TEAM, KENT COUNTY, MARYLAND
Left to right: H. B. Derrick, Co. Agt., M. L. Sutton, W. Morris, S. Sutton.

The first prize winners of all the breeds are as follows:

Jerseys

Judge: John C. McNutt, New Hampshire.

Bull 3 years old or over—Twin Oaks Farm, New Jersey, on Fern's Wexford Noble. Bull 2 years and under 3—Twin Oaks Farm on East Lynne Prince. Bull 1 year and under 2—Twin Oaks Farm on Counterstroke. Senior bull calf—Twin Oaks Farm on Oxford Wexford Noble. Junior bull calf—Holly Beach Farm, Maryland on Mistletoe's Hermit.

Cow 4 years old or over—Twin Oaks Farm on Fern's Oxford Diana. Cow 3 years and under 4—Twin Oaks Farm on Volunteer's Merry Magpie. Cow 2 years and under 3—Twin Oaks Farm on Volunteer's White Sox. Senior yearling heifer—Twin Oaks Farm on Fern's Oxford Columbia. Junior yearling heifer—Twin Oaks Farm on Fern's Oxford Silver Thread. Senior heifer calf—Twin Oaks Farm on Fern's Oxford Melodant. Junior heifer calf—Reynolds Inc., North Carolina, on No. 124.

Senior and grand champion male—Fern's Wexford Noble. Junior champion male—Oxford Wexford Noble.

Senior and grand champion female—Fern's Oxford Diana. Junior champion female—Fern's Oxford Silver Thread.

Ayrshires

Judge: John Cochran, Pennsylvania.

Bull 3 years old or over—Alta Crest Farm, Massachusetts, on Bargenoch Masterstroke, Imp. Bull 1 year and under 2—Alta Crest Farm on Alta Crest's Happy Go Lucky. Senior Bull Calf—Alta Crest Farm on Alta Crest Weather Vane. Junior bull calf—Alta Crest Farm on Alta Crest Diploma.

Cow 4 years old or over—Alta Crest Farm on Buntonhill Mabel Chance, Imp. Cow 3 years and under 4—Alta Crest Farm on Alta Crest Spicy Queen. Cow 2 years and under 3—Alta Crest Farm on Alta Crest Powder Puff. Senior yearling heifer—Alta Crest Farm on Alta Crest Bright Lass. Junior yearling heifer—Alta Crest Farm on Alta Crest Sauce 2nd. Senior heifer calf—Alta Crest Farm on Alta Crest Hill Brow. Junior heifer calf—Alta Crest Farm on Alta Crest Sweet Marie.

Senior champion male—Bargenoch Masterstroke, Imp. Junior and grand champion male—Alta Crest's Happy Go Lucky.

Senior and grand champion female—Buntonhill Mabel Chance, Imp. Junior champion female—Alta Crest Bright Lass.

Get of sire—Alta Crest Farm on get of Morton Main's Lord Barry-Lyndon. Produce of dam—Alta Crest Farm on produce of Allancroft Mildred. Breeder's calf herd, breeder's young herd, exhibitor's herd, 4 cows in milk, junior A. R. cow, senior A. R. cow—Alta Crest Farm.

Holstein-Friesians

Judge: R. E. Haeger, Illinois.

Bull 3 years old or over—Pinery Farms, Ohio, on King Pietertje Jewel Korndyke. Bull 2 years and under 3—H. E. Robertson, Pennsylvania, on King Piebe of York 13th. Bull 1 year and under 2—Mountain View Farm, Maryland, on Trembal King Colantha Calan. Senior bull calf—Mountain View Farm on 221 A. Junior bull calf—Karl H. Nim's, Ohio, on King One Aaggie Ormsby.

Cow 4 years old or over—Pinery Farms on Kismet Fayne of Valley View. Cow 3 years and under 4—Springfield State Hospital, Maryland, on Eli Oak Prilley. Cow 2 years and under 3—Mountain View Farm on Dutchman's Konigen Ragapple. Senior yearling heifer—Pinery Farms on Model Cornucopia Ona. Junior yearling heifer—Pinery Farms on Ona Gabriel Walker. Senior heifer calf—Springfield State Hospital on Spring Syke Juliana. Junior heifer calf—Karl S. Nims on Aaggie Ona Button Concordia.

Senior and grand champion male—King Pietertje Jewel Korndyke. Junior champion male—Trembal King Colantha Calan.

Senior and grand champion female—Kismet Fayne of Valley View. Junior champion female—Spring Syke Juliana.

Get of sire—Pinery Farms on get of King Ona. Produce of dam—H. E. Robertson on produce of Pearl Pietertje Burke Pontiac. Breeder's calf herd, breeder's young herd—H. E. Robertson. Exhibitor's herd, junior A. R. cow, senior A. R. cow—Pinery Farms; 4 cows in milk—Springfield State Hospital.

Guernseys

Judge: Gordon Hall, New Jersey.

Bull 3 years old or over—Brooklandwood Farm, Maryland, on Brooklandwood Reckless. Bull 2 years and under 3—Circle W. Farm, Ohio, on Flashlight of Cedar Hill. Bull 1 year and under 2—Breidablik Farm, Delaware, on Cherub's Nonpariel of the Prairie. Senior bull calf—L. C. Scarborough, Maryland, on Mary's Patient King. Junior bull calf—A. Stanley Zell, Maryland, on Thornton's Sheik.

Cow 4 years old or over—Gerar Farm, Maryland, on Imported Secret of Crane Farm. Cow 3 years and under 4—Bloomfield Farm, Maryland, on Fisherman's Flora of Mt. Ararat. Cow 2 years and under 3—Breidablik Farm on Mogna of Breidablik. Senior yearling heifer—Gerar Farm on Helen of Seiberling Farm. Junior yearling heifer—Circle W. Farm on Lulu White. Senior heifer calf—

FIRST PRIZE AYRSHIRE GET OF SIRE

TREMBAL KING COLANTHA CALAN, JUNIOR CHAMPION HOLSTEIN BULL
OWNED BY MOUNTAIN VIEW FARM, MARYLAND

ELI OAK PRILLEY, FIRST PRIZE 3-YEAR-OLD HOLSTEIN COW
OWNED BY SPRINGFIELD STATE HOSPITAL, MARYLAND

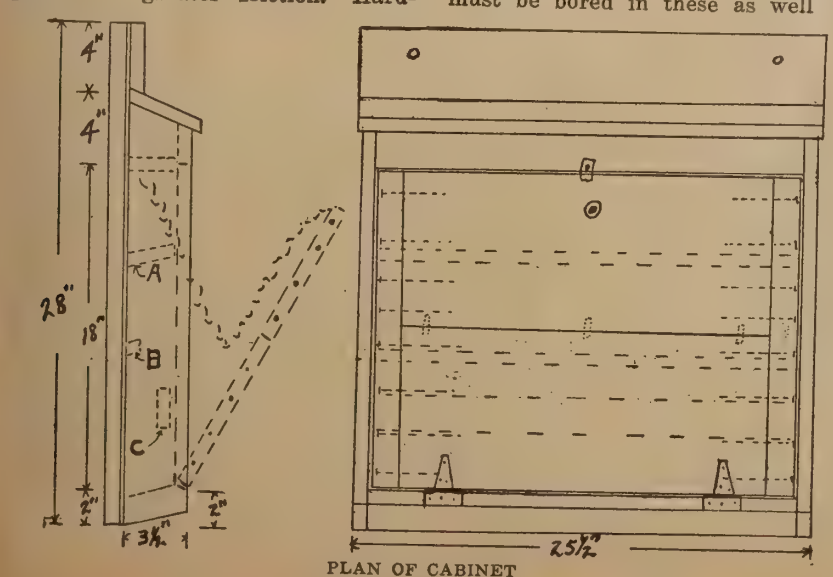
Breidablik Farm on Forget-me-not of Breidablik. Junior heifer calf—R. H. L. Chichester, Virginia, on Glencairne Venus.

Junior and grand champion male—Cherub's Nonpariel of the Prairie. Senior champion male—Brooklandwood Reckless.

Senior and grand champion female—Imported Secret of Crane Farm. Junior champion female—Helen of Seiberling Farm.

Get of sire—Breidablik Farm on get of Brookmead's Laurus of Breidablik. Produce of dam—Breidablik Farm on produce of Glen Gable Guest. Breeder's calf herd, breeder's young herd, junior A. R. cow—Breidablik Farm. Exhibitor's herd, 4 cows in milk, senior A. R. cow—Gerar Farm.

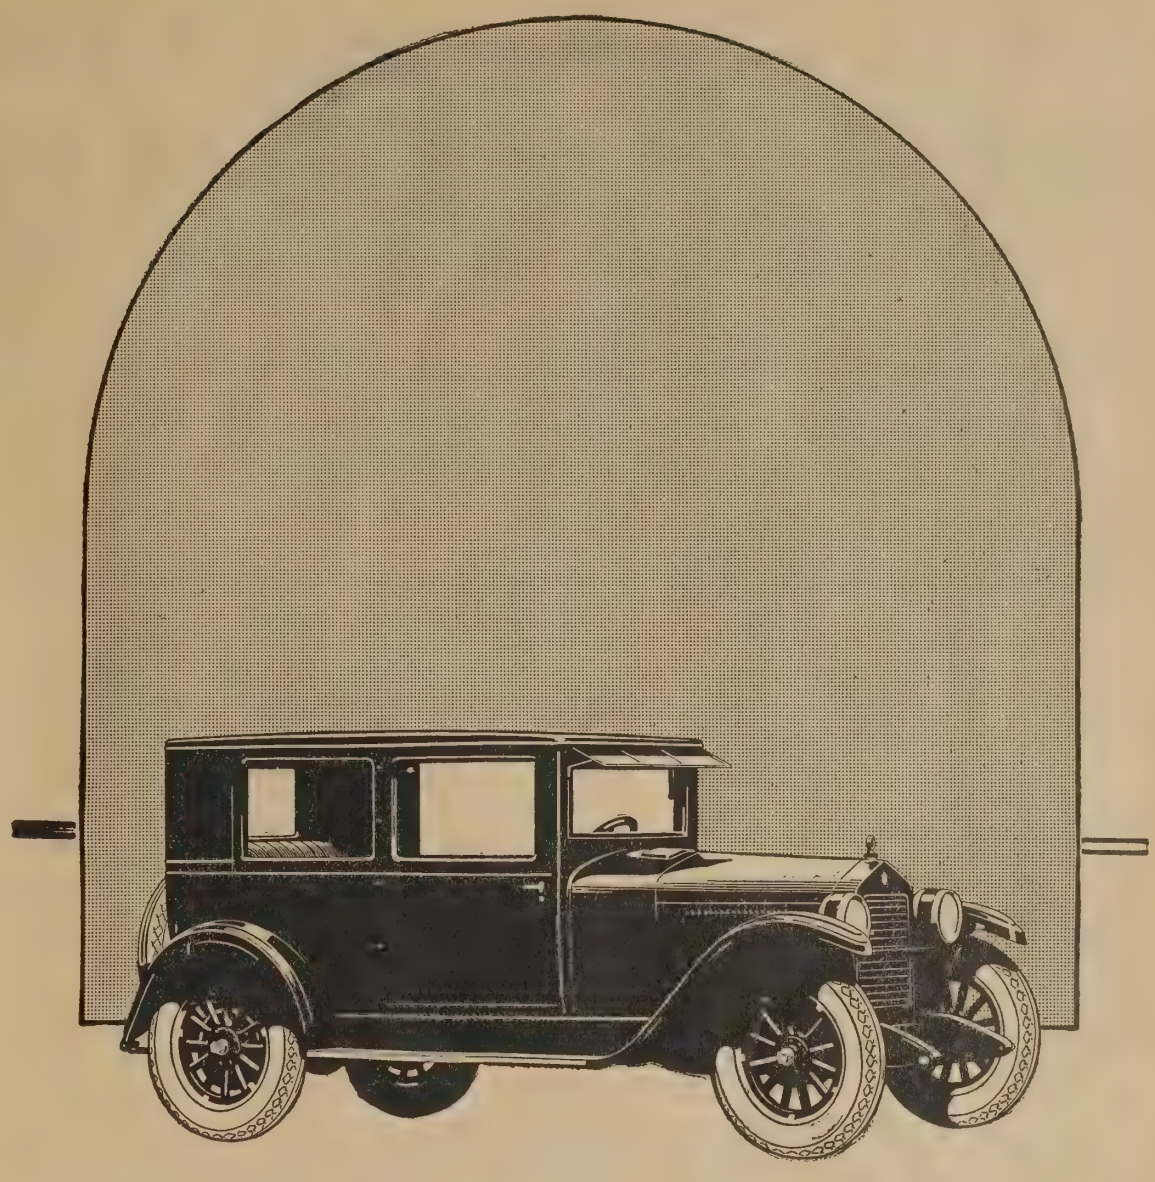
Dairy Records Cabinet



HOARD'S DAIRYMAN:—When I commenced to use the large monthly milk sheets, I found that a suitable place was lacking. To tack it upon the wall wasn't satisfactory; a permanent shelf was in the way as well as lacking protection for sheet. A hinged shelf was an improvement, but still it had its drawbacks. Therefore, I devised the cabinet as illustrated. This meets the requirements ideally. It is small, portable, occupies little space when folded up, and gives absolute protection for record sheets. It also provides a place for other records such as breeding dates, feed records, etc.

I made the cabinet according to lumber available and size of milk sheet. The important thing is to have a door large enough to take the sheet without folding, hence a door 18x24 inches was necessary for my cabinet. The material is ¾" dressed soft pine. Since I had no D. & M. lumber for back I put heavy roofing felt next to cabinet before I nailed the boards on the back. This was to make cabinet moisture proof. Boards on back are nailed up and down. The bottom cross-piece is 1½" material. This is necessary, since the door hinges on this piece. Since this piece slopes inward, I planed down the edge where door meets it so that just under door the slope is outward. This will drain off any moisture that may run down outside of door. The bottom of door is beveled off too, to correspond with cut in plate underneath. The top is made to drain off any water that may fall upon it. The cabinet is constructed to give moisture proof protection to the contents within.

The shelf "A" is just an after thought added to cabinet. I wanted to use the space on back for something, so I put a small shelf there. It comes in handy for small things that find their way into a dairy barn. Ledge "B" is intended primarily for pencils. It should slope up on outer edge so that pencils will stay when put there. Board "C" makes a rack for holding records or memoranda books. In order to give front of cabinet a flush appearance when door is closed, I put cleats on door on sides, using 16 pwt nails that I rosined to give them greater friction. Hardwood cleats were used. Small holes must be bored in these as well as part way in boards. Door folds down and is supported with a chain to make it stand out at right angles when using. Chain folds up inside of cabinet when door closes. Small thumb tacks are used to fasten sheet to door.



Though small, this cabinet serves very well for a barn desk. You can keep lots of useful material in it and save you many a trip to the house. I have found it a long wished for article and adds to the efficiency of record keeping on the farm.

Minnesota. F. E. KNOCK.

PLAN OF CABINET

Amy Rag Apple Pontiac is now Rhode Island's leading cow of the breed for production in ten months as a junior four-year-old. Her record is 21,407.2 pounds milk, 702.28 pounds butterfat, equivalent to 877.8 pounds butter.—Extension Service Holstein-Friesian Ass'n. of America.

EDITORIAL COMMENT

WHAT makes a thorough farmer? How shall we know him? Suppose we measure him by the following standard: The highest degree of skill and intelligence; the most careful preservation of fertility; and the best and thorough methods for carrying on the farm. One thing we note almost always when we strike a thorough farmer and that is he is almost always on a moderate sized farm. He seems to be more concerned about getting large returns from a few acres than a moderate return from many acres.

THE Co-operative Pure Milk Association, Cincinnati, is organizing a cow testing association. This co-operative association is the first to retail milk in a large city and those in charge of it have been led to see by practical experience that the unprofitable cow is a drag upon the success of their enterprise. The cow testing association will find the unprofitable cows, the ones that produce surplus milk and decrease the prices of dairy products. There is nothing like contact with actual business affairs to teach the dairy farmer or his representatives sound business practices.

A SUBSCRIBER writes: "I am milking cows strictly for the profit in the business and do not care a rap what color they are, how they are marked, or how they are shaped. 'What will they do over the scale and Babcock tester for eight months?' is the only question I ask." It must be admitted that color, markings, or beauty of form have little or nothing to do with profit at pail. Nevertheless most dairy farmers desire to see in their barns well marked and well shaped cows. There is more satisfaction in owning a good looking herd of cows than one that is illy marked, colored, and shaped. This man who says he does not care a rap for color, markings, or shape is keeping cows simply for milk production and from his standpoint the cow that gives the most milk is the one which he prefers. We would consider it a serious mistake, however, if all men took the same view of their herds.

MYSTERIES OF SKIMMILK

Few farmers fully appreciate the feeding value of skimmilk. Experiments have been made to determine the feeding value of skimmilk for all kinds of live stock, but one of the most striking results which have ever come to our notice was obtained at the Michigan Experiment Station. Professors Reed and Huffman planned an experiment for the purpose of demonstrating the value of skimmilk in supplementing corn for rearing swine. The details of this experiment are reported on page 270 of this issue, but one pig in particular made such phenomenal gains on skimmilk after being fed a starvation ration for a year, that we feel we must call particular attention to it. Further, this experiment so emphasizes the value of skimmilk for supplementing corn for raising and fattening swine that it needs to be emphasized.

One pig in the experiment received corn and water for one year and weighed at the end of that time only 76 lbs. Then skimmilk was added to the corn and in five months' time the pig gained 274 lbs.; or, in other words, weighed, at the age of 17 months, 350 lbs. There are those, when calculating the cost of producing 100 lbs. of pork, who estimate it requires 11 to 12 bushels of corn. This is a misleading calculation, for pigs on corn alone, no matter what its price may be, will not make profitable gains. Adding a little skimmilk to the corn makes it very nearly a perfect ration.

Experiments carried on at the Michigan Experiment Station show the folly of attempting to raise hogs on corn and water. Skimmilk is quite as essential for raising profitable pigs as corn and when a little is fed to the hog in connection with corn, he will make tremendous gains. If all farmers fully appreciated the feeding value of skimmilk the problem of co-operative marketing of milk would be much simpler. Skimmilk at the present prices of pork and corn is worth 55 to 60 cents a hundred. Pork raising becomes a profitable industry when a little skimmilk is fed with corn. It is a miserable failure when only corn and water are fed.

NATIONAL DAIRY EXPOSITION

As we view the proposed exhibits for this year's National Dairy Exposition, we consider them the best and most educational that have ever been planned in the history of this institution. It seems to us this year's display of dairy cattle, machinery, products, demonstrations, educational exhibits, etc., come nearer to meeting the ideal and measuring up to the opportunity of a great national dairy exposition than has ever been previously planned and presented. We do not know as the exhibits of pure-bred dairy cattle will be any better or that the machinery exhibit will be larger or finer, but we are sure the educational exhibit will be better and the grade cow, coming in the force that she is, will make the 1924 Dairy Show stand out in history.

The grade cow has been neglected. She is the one that has the largest following; she produces the larger part of the dairy products of this country. It has taken a long time to get a sufficient number of cow testing associations established and a sufficient number of grade dairy cows tested to warrant an attempt to make an exhibit of these cows and to show just what they are capable of doing. The cow testing association, of course, reaches all classes including the grade, the pure-bred, and the scrub. There will be on exhibition a herd of pure-bred cattle with cow testing association records. The knowledge, the understanding, the inspiration which cow testing associations give to those who belong to them is immeasurable. The Dairy Show at its best can only give an inkling of their meaning to the advancement of the dairy industry.

It is with keenest satisfaction that we note that this year's Dairy Show is devoting so much of its space and energy to things which we consider fundamental to the welfare of the people of the nation, to the financial success of the dairy farmer, and to placing the dairy industry before the people of this country in its proper light.

IN LOVE WITH HIS JOB

The man who is not in love with his job is one of the most unfortunate persons in the world. No sum of money, no power or distinction, can bring the genuine satisfaction and contentment that a person receives when he likes the work which he has to do.

We recently met a man thoroughly in love with his job. He is a herdsman and in charge of making semi-official records with Holstein cows. He milks several of them four times a day, which makes his hours long and does not permit him to be in bed as many as six hours in succession. He is required to work 365 days of the year; still he loves his job. Two or three years ago he married and the owner of this herd, as a wedding gift, paid his way to the Dairy Show which was held in St. Paul. He stayed but a few days and when asked why he returned so soon, he said that he could not with any comfort remain away from his cows any longer. We heard the owner offer him an opportunity to attend the National Dairy Show this year which will be held in Milwaukee September 27th to October 4th. He said that he didn't think he cared to go and would not, unless the owner insisted.

It is perhaps unfortunate to be so much interested in your work that you cannot enjoy other things and take time for recreation and to visit fairs, attend meetings or entertainments. It is far better, however, so far as happiness is concerned, that a person overdoes liking his job, rather than to dislike it so much that he desires to spend all his time seeking happiness, taking recreation, and attending entertainments. Such people are seldom happy and when a person is not happy in his work there is very little happiness in this world for him. It is important for young men in determining what they are good for that they find some kind of work they not only can do well but that they will like.

Being in love with your job is the greatest asset, outside of health, that a human being can possess. Too few appreciate this.

GOOD BREEDERS

One of the great virile forces in the advancement of agriculture is the 4-H club movement, with an army of nearly a half million boys and girls doing supervised agricultural project work throughout the United States. Live stock and grain breeders who have not caught the vision of what this movement means should get on the wagon and take a ride and see for themselves the value of this great movement.

A farmer who had three boys in club work recently told us of some of the difficulties which he and his boys encountered in purchasing live stock for club work. They were looking among the hog breeders in their territory—southern Wisconsin and northern Illinois—to purchase animals for club work which would make a creditable showing at fair time. The first breeder approached showed them a lot of about sixty or seventy pigs. This breeder was told that the animals were wanted for club work. The prices he quoted on these animals were considerably higher than the average. The farmer told us that not one of the pigs shown them would make a creditable showing in a show ring.

When asked where he kept his good pigs, the breeder said they were over in another lot but were not for sale because he intended to show them himself. Naturally the man and his sons did not purchase any animals from this farm. Later they visited a hog breeder who was not planning to show his pigs. An inquiry for club pigs brought good results for the farmer and his boys. This breeder showed them some of his typiest pigs and quoted them at a reasonable figure slightly above market price. This man realized the importance of club work. He realized that the farm industry of the future depends upon the farm boys and girls of today. Good breeders should be willing to sacrifice a little today for the betterment of the industry tomorrow. It is not fair nor just, neither is it good business sense, to try to sell poor live stock at high prices to 4-H club members or to anyone else.

CREAM GRADING

The manufacture of butter is one of the most important industries of this country. Since the beginning of this industry, the buttermakers have been confronted with the problem of securing high quality milk and cream. No process of manufacture has been able to make a poor grade of raw material into a high quality of butter. For the past five years or more, there has been a growing sentiment in favor of cream grading and paying for cream according to quality. There is nothing more detrimental to the dairy industry than poor quality butter. It leads the consumer to stop using butter and to buy substitutes.

Cream grading is a paramount issue and will be given consideration at a conference to be held at the Milwaukee, Wis., Auditorium in connection with the National Dairy Show on September 30th. The principal speakers on this occasion will be Dr. C. W. Larson, Chief of the Bureau of Dairying, and Professor C. Mortensen of the Iowa College of Agriculture. Some national standard should be adopted for grading cream and then all creameries should follow the practice of purchasing cream according to this standard.

Sweet Clover Lives Two Years

How many years will sweet clover last for pasture? Won't it be necessary for it to go to seed in the fall so that it reseeds?

New Bloomfield, Pa. G. W. W.

Sweet clover seeded in the spring should give pasture in the fall of that year. It will also give pasture into the late summer of the second year. Following that, it will dry down and produce no further growth. The sweet clover is a biennial plant; that is, it produces a growth the second year and then dies. If there is considerable growth in the pasture that goes to seed the second year, it is possible that the pasture will reseed itself. It is doubtful, however, whether in most cases this will be satisfactory and it would be safer to disk the field thoroughly and reseed again.

Weight of Alfalfa Silage

How many tons of alfalfa would there be in a silo 30 ft. high and 20 ft. in diameter? We have the figures for corn and ordinary silage, but understand that the alfalfa being allowed to dry somewhat would occupy more space.

East Grand Forks, Minn. F. C. M.

There are no figures available concerning the weight of alfalfa silage. We have conducted considerable experimental work with alfalfa silage but did not determine the tonnage which would be contained in a silo. The most recent tables for estimating the weight of silage are based on settled silage. In 30 feet of settled silage in a silo 20 feet in diameter there would be about 185 tons of silage made of corn under typical conditions. From our experience with alfalfa silage, I would judge that you are correct in your opinion that it would be somewhat lighter than the corn silage, although not materially. I would estimate that 30 feet of alfalfa silage in a 20-foot silo would weigh approximately 160 tons. C. H. ECKLES.

Minnesota College of Agriculture.

Storing Green Alfalfa

Professor L. F. Graber, in describing the barn curing process followed by Mr. Math. Michels, stated that the alfalfa should be spread in layers 8 to 10 feet deep over the mow at a cutting. Please let me know how much time should elapse before another layer of alfalfa may be put in the mow.

Hammondsport, N. Y. J. A. R.

As a rule, I would judge it best to allow alfalfa hay that is put in the mow to a depth of about eight or ten feet to remain there for a period of three weeks before additional hay is added. I am referring now to hay that is put up while still in a semi-green condition. With this period, the heating process should, for the most part, have "spent itself".

In many sections there has been so much rainfall this season that the air is very humid, and care should be used to refrain from storing alfalfa hay that is damp with dew or rain, or that is too green. Where this is done, the heating may occur to such an extent as to blacken the hay and spontaneous combustion might occur. It is also important that the hay be spread evenly and uniformly in the mow. L. F. GRABER.

Wisconsin College of Agriculture.

Fall Seeding Sweet Clover

Can we sow sweet clover in the fall on a piece of clover hay land?

Monticello, Wis. F. D. T.

We do not advise the fall seeding of sweet clover and it is doubtful whether general success will follow this practice if sweet clover is seeded after August 1st. Some farmers have followed the practice of seeding in the last cultivation of corn and report good success with this. It is also possible that in favorable years the sweet clover could be seeded on grain stubble after harvest, merely by disking the field.

As a general rule, most men follow the practice of seeding sweet clover with grain in the spring, sowing from 8 to 12 lbs. of seed per acre. It may also be seeded in the spring on fall seeding of rye or wheat. This combined seeding may be pastured when the grain, say, is 6 inches high. If the grain is left to mature, the sweet clover will furnish good pasture the fall after cutting the grain, as also early in the spring and during the summer of the succeeding year.

With spring seeding, we recommend the use of scarified biennial white sweet clover. If you desire to try seeding in the fall or on land already in pasture, it might be preferable to use the unscarified seed, putting on about double the quantity. When the seed is not scarified, the tough outer coat keeps it from germinating readily, which will hold over a certain percentage of the seed from germinating until the next year. This helps to insure a crop where the late fall seeding kills out due to the winter weather and the small growth it made before freezing.

What has been the experience of our readers with seeding sweet clover in the fall or late summer?

Sunflower Silage

Would you kindly advise me when to cut sunflowers for silage? I have sunflowers and corn mixed about half and half. Corn now just starting ears and sunflowers just starting to blossom. Kindly let me know what you think of this silage for dairy feed.

Viroqua, Wis. A. L. E.

There is a considerable difference of opinion as to when sunflowers should be cut in order to produce the best quality of silage. We are inclined to the opinion that under most conditions it is better to wait until one-half to three-fourths of the sunflowers in blossom show the seed to be in the late milk or early dough stage. According to such information as we have been able to gather, the sunflowers will then still be well filled with moisture and the probabilities are that it will ordinarily make the best grade of silage.

As with any new crop, there is a great difference of opinion as to the value of sunflowers for silage. Some men have tried it and are disgusted with it, while others are just as enthusiastic in saying that it is equal to or superior to corn silage. Our own judgment is that where corn does not make a good crop, owing to a short growing season, probably sunflowers when properly ensiled will produce silage nearly, if not quite, equal to corn silage. Where corn will grow well and come to a fair maturity for silage it is our belief that it is the best crop to grow for silage. Feeding trials generally indicate that sunflower silage is somewhat less palatable and not quite as valuable ton for ton as is corn silage. The great value of sunflowers is for use in those sections where corn does not make a good crop.

When to Seed Sweet Clover

Have been reading so much lately about sweet clover pasture that I am really getting interested in it too, but have never heard anything about sowing time. Can it be sowed and pastured in the same season? Does it need a nurse crop? Would it be time in fall to sow and pasture next year? Does it need limed ground like alfalfa?

Brooklyn, Wis. H. B.

Sweet clover starts slowly and it is not often that conditions are favorable enough to get a stand by seeding in August. Some plants may make a start but will usually not be large enough to live over winter in this latitude. It is much better to sow sweet clover in the spring in small grain. Where wanted for pasture the same spring as sown it can be either sown alone or with oats.

Since sweet clover starts slowly it is not as well adapted to pasturing the first spring, and two months' pasture season is lost over seeding in the spring the year before in small grain. It must not be turned onto until the plants are at least six or eight inches high, which usually means two months after seeding. If the seed is sown the middle of April it will be the middle of June before it should be pastured.

I would sow ten pounds of scarified biennial white sweet clover seed per acre. It is absolutely essential that the soil be limed if acid, and inoculated if not already so.

Ill. College of Agriculture. W. J. FRASER.

Seeding Sweet Clover on Sod

HOARD'S DAIRYMAN:—From my observation and study it is not wise to sow a nurse crop with sweet clover when putting it into an old blue grass pasture. Under these conditions the sweet clover has enough to contend with in fighting the blue grass without having a nurse crop to contend with in addition. Of course, if many weeds were coming up it might be better to sow a nurse crop to fight these, but this is not usually the case in old blue grass pastures according to my observation.

From what I can learn it is almost useless to sow sweet clover seed on blue grass pasture unless the blue grass is pretty well cut up with a disk or some other tool, so that the seed can actually be worked into the soil. I have known it to be sown many times on top of blue grass in February and have heard of many people getting considerable sweet clover in that way. But I have never yet seen enough sweet clover gotten in this manner to pay for a quarter of the seed. This is, of course, not saying it will not pay in some cases. As I mentioned in one of the articles, where the blue grass is allowed to grow up rather high in the fall and is making a tough sod, it is almost impossible to get sweet clover into the ground, even with a disk.

If scarified seed is used in an old blue grass pasture, and it all grows the first year, there would be no sweet clover pasture the second fall or the third spring. To get continuous sweet clover in blue grass, one must reseed each spring for two years or else use unscarified seed.

Ill. College of Agriculture W. J. FRASER.

Silage With and Without Ears

What is the comparative feeding value of corn silage made of sweet corn and field corn?

What is the difference in feed value of silage made from corn where the ears are pulled off and heavily eared corn?

Norwalk, Calif. B. D. C.

There is very little difference in the composition of silage made from sweet corn and that made from field corn. The sweetness of sweet corn is due to its content of glucose, but as glucose and starch have about the same feeding value this does not affect the content of nutrients in the two plants. While for all practical purposes the feeding value of the silage would be the same, it is probable that the sweet corn silage would contain slightly more protein and be somewhat more palatable, but it would contain less carbohydrates.

Corn silage made from corn from which the ears have been removed at time of ensiling is about 75% as valuable, ton for ton, in feeding value as that which contains the ears. Not only is the resulting silage lower in feeding value per ton, but there would be a reduced tonnage per acre, amounting to approximately 60% of the weight it would have been if the ears had been left on. In other words, the weight of the green ears is about 40% of the total weight of the corn plant when ensiled.

This comparison is based upon corn from which the ears have been removed at the usual time of ensiling. In the growth of the corn plant, particularly during the latter stages, large portions of the nutrients are taken from the stalks and deposited in the kernels of corn. The comparison given above would not hold good for silage made from corn cut when it was in the roasting ear stage. The feeding value of such silage would more nearly equal the feeding value of silage made from the entire corn plant at the usual stage of maturity for ensiling.

Where corn is allowed to mature for grain and the corn stover is later ensiled, feeding experiments indicate that such silage is only 60% as valuable, ton for ton, as the silage made from the entire corn plant that is ensiled at the usual stage of maturity.

Many years ago, Professor Haecker, of the Minnesota Experiment Station, found that he could produce quite as much milk per acre from corn so closely drilled that it would not produce good ears as he could from corn more thinly planted and in which the ears were mature. A part of the explanation for this is that the nutrients instead of being deposited in the kernels on the ear were still in the stalk and leaves of the corn.

In order to equal the feeding value of corn silage made from the entire plant, silage made from corn with the ears removed will have to have put back practically the same amount of ground corn as was originally taken away. There may, however, be good reason for husking out some of the ears in order to have ear corn for feeding to stock other than the dairy cattle, such as to hogs, fattening animals, etc. As feed for dairy cows, there is no better place for the entire corn plant than the silo. It is a waste of labor and expense to husk out the grain and later grind it for the cows. Where one has a large acreage of corn, it might prove profitable, even on the dairy farm, to husk out a portion of the ears and either sell the ear corn or feed it to other live stock on the farm that cannot make good use of corn stover or of silage.

THE NEW YORK STATE FAIR

SENIOR AND GRAND CHAMPION JERSEY BULL,
FERN'S NOBLE WEXFORD SULTAN
OWNED BY S. M. KAPLAN, NEW YORK

SENIOR AND GRAND CHAMPION JERSEY COW,
QUEEN PLYMOUTH OF LEHIGH
OWNED BY ELM HILL FARM, MASSACHUSETTS

SENIOR AND GRAND CHAMPION BROWN SWISS COW,
SWISS VALLEY GIRL 7TH
OWNED BY HULL BROS., OHIO

THE great Empire State was on exhibition at Syracuse September 8—13. Rain and cold weather caused a considerable shrinkage in the attendance for two days yet the total figures were not as disappointing as many expected.

We are all familiar with the fact that New York State and dairying are linked together for life and with this in mind the average out-of-state visitor usually spends a good share of his time sizing up the many interesting booths and exhibits in the dairy building. The much discussed co-operative organizations are also worthy of attention and evidence as to their worth is easy to secure.

The dairy cattle show consisting of the five breeds was about on a par with last year. Holsteins, of course, were represented by more animals than any other breeds. The Guernsey show was next in size, closely followed by the Jerseys. About 550 animals were shown.

Bob Haeger judged the Holstein classes and found his best male to be King Pietertje Jewel Korndyke owned by Pinery Farms. This aged bull won at Ohio and Maryland this year and also has an enviable 1923 show record. Hargrove & Arnold won the excellent grand champion female honors with their excellent three-year-old, Dorothy Ormsby Piebe.

Adam Seitz & Sons won the Ayrshire male grand championship with the show ring veteran, Cavalier's Ping Pong. Alta Crest won the corresponding female honors with Buntonhill Mable Chance. John Cochrane judged this breed.

Shorewood Resolute was selected by Judge Philipps as the grand champion Guernsey bull. He is owned by Emmadine Farms. The female grand championship went to the same herd and was won by Daylo Yuletide, a promising two-year-old.

The Jersey ribbons were tied by Jimmy Dodge. Fern's Noble Oxford Sultan, owned by Rockcliffe Farms, was the senior and grand champion. Elm Hill Farm won the female grand championship with Queen Plymouth of Lehigh. She is an aged cow.

Swiss Valley Girl 7th, owned by Hull Bros., won the female grand championship and the other Brown Swiss championship went to the same herd on Dale of Lakeview. The Brown Swiss classes were judged by R. E. Haeger.

The first prize winners of all the breeds are as follows:

Holsteins

Bull 4 years old or over—Pinery Farms, Ohio, on King Pietertje Jewel Korndyke. Bull 3 years and under 4—Karl S. Nims, Ohio, on Friend Piebe. Bull 2 years and under 3—Yates Farms, New York, on Count Korndyke Posch. Bull 1 year and under 2—Hargrove & Arnold, Iowa, on Triune Ormsby Piebe 27th. Bull, senior calf—Hargrove & Arnold on King Piebe 28th.

Cow 4 years or over—Pinery Farm on Kismet Fayne of Valley View. Cow 3 years and under 4—Hargrove & Arnold on Dorothy Ormsby Piebe. Heifer 2 years and under 3—Yates Farms on Pledge Segis Lyons. Heifer, senior yearling—Pinery Farms on Model Cornucopia Ona. Heifer, junior yearling—Hargrove & Arnold on Miss De Kol Piebe. Heifer, senior calf—Hargrove & Arnold on Neola Piebe Annis.

Senior and grand champion male—King Pietertje Jewel Korndyke. Junior champion male—Triune Ormsby Piebe 27th.

Senior and grand champion female—Dorothy Ormsby Piebe. Junior champion female—Neola Piebe Annis.

Exhibitor's herd, Yates Farms. Pair of calves, get of sire, produce of cow, and best 4 females—Hargrove & Arnold. Best 4 cows over 3 years old—Yates Farms.

Ayrshires

Bull 3 years old or over—Adam Seitz & Sons, Wisconsin, on Cavalier's Ping Pong. Bull 2 years and under 3—Ash Grove Farms, New York, on Alta Crest Ting-a-Ling. Bull 1 year and under 2—Alta Crest Farms, Massachusetts, on Alta Crest Happy Go Lucky. Bull, senior calf—Alta Crest Farms on Alta Crest Weather Vane.

Cow, 4 years or over—Alta Crest Farms on Buntonhill Mabel Chance Imp. Cow 3 years and under 4—Ash Grove Farms on Penshurst Belinda. Heifer 2 years and under 3—Alta Crest Farm on Alta Crest Powder Puff. Heifer, senior yearling—Adam Seitz & Sons on Cav. Queen of Diamonds. Heifer, junior yearling—Adam Seitz & Sons on Cav. Darling. Heifer, senior calf—Alta Crest Farms on Alta Crest Hillbrow.

Senior and grand champion male—Cavalier's Ping Pong. Junior champion male—Alta Crest Happy Go Lucky.

Senior and grand champion female—Buntonhill Mabel Chance Imp. Junior champion female—Cav. Queen of Diamonds.

Exhibitor's herd, pair calves—Alta Crest Farms. Yearling herd, get of sire, produce of cow, best 4 cows over 3 years old, best 4 females—Adam Seitz & Sons.

Guernseys

Bull 3 years old or over—Emmadine Farm, New York, on Shorewood Resolute. Bull 2 years and under 3—Emmadine Farm on Florham Abbott. Bull 1 year and under 2—F. J. Rueping, Wisconsin, on Corium Cherub's Edgar. Bull, senior calf—F. J. Rueping on Corium Snowdrop's Eric.

Cow 4 years or over—Emmadine Farm on Massachusetts Raider's Primrose. Cow 3 years and under 4—F. J. Rueping on Floridale Merry Maid. Heifer 2 years and under 3—Emmadine Farm on Daylo Yuletide. Heifer, senior yearling—F. J. Rueping on Corium Elizabeth's Dolores. Heifer, junior yearling—Orra E. Hinton, New York, on Queen Bess of Orradale. Heifer, senior calf—Emmadine Farm on Resolute's Red Rose.

Senior and grand champion male—Shorewood Resolute. Junior champion male—Corium Cherub's Edgar.

Senior and grand champion female—Daylo

FIRST PRIZE CAYUGA COUNTY, NEW YORK, GUERNSEY HERD

FIRST PRIZE ERIE COUNTY, NEW YORK, HOLSTEIN HERD

SENIOR AND GRAND CHAMPION GUERNSEY COW,
DAYLO YULETIDE
OWNED BY EMMADINE FARM, NEW YORK

SENIOR AND GRAND CHAMPION GUERNSEY BULL,
SHOREWOOD RESOLUTE
OWNED BY EMMADINE FARM, NEW YORK

PLEDGE SEGIS LYONS, FIRST PRIZE 2-YEAR-OLD
HOLSTEIN COW
OWNED BY HARRY YATES, NEW YORK

Yuletide. Junior champion female—Resolute's Red Rose.

Exhibitor's herd, get of sire, produce of cow, best 4 cows over 3 years old—Emmadine Farm. Yearling herd—F. J. Rueping. Pair of calves. Best 4 females—Gayhead Guernsey Farms, New York.

Jerseys

Bull 3 years old or over—Rockcliffe Farms, New York, on Fern's Noble Oxford Sultan. Bull 2 years and under 3—Hempstead Farms, New York, on Cowslip's Farewell. Bull 1 year and under 2—Elm Hill Farm, Massachusetts on LaSente's Golden Sultan. Bull, senior calf—Wauban Farms, Massachusetts, on Molly's Boy of Wauban.

Cow, 4 years or over—Elm Hill Farm on Queen Plymouth of Lehigh. Cow 3 years and under 4—Rockcliffe Farms on Toffee. Heifer 2 years and under 3—Elm Hill Farm on Spy Girl's Surprise. Heifer, senior yearling—Elm Hill Farm on Xenia's Peggy Rosenary. Heifer, junior yearling—Elm Hill Farm on Xenia's Dandy Actress. Heifer, senior calf—Rockcliffe Farms on Golden Maid's Rive.

Senior and grand champion male—Fern's Noble Oxford Sultan. Junior champion male—LaSente's Golden Sultan.

Senior and grand champion female—Queen Plymouth of Lehigh. Junior champion female—Xenia's Dandy Actress.

Exhibitor's herd, get of sire—Elm Hill Farms. Yearling herd, pair of calves—D. A. Curtis, New York. Produce of cow—John Lucksinger, New York. Best 4 cows over 3 years old—Waubun Farms. Best four females—M. H. & M. A. Clark, New York.

Brown Swiss

Bull 3 years or over—Hull Bros, Ohio, on Carl the 13th. Bull 2 years and under 3—Hull Bros. on Dale of Lake View. Bull 1 year and under 2—Hull Bros. on Lottie's Prince of Lake View. Senior bull calves—Hull Bros. on Bob of Lake View.

Cow 4 years or over—Hull Bros. on Swiss Valley Girl 7th. Cow 3 years and under 4—Hull Bros. on Nellie F. Beaut. Heifer, 2 years and under 3—Hull Bros. on Margaret Lake View 4th. Senior yearling heifer—Hull Bros. on Irene of Lake View. Junior yearling heifer—Hull Bros. on Militor Emma of Lake View. Senior heifer calves—Hull Bros. on Beauty of Lake View.

Senior and grand champion male—Dale of Lake View. Junior champion male—Lottie's Prince of Lake View. Senior and grand champion female—Swiss Valley Girl 7th. Junior champion female—Irene of Lake View.

Exhibitor's herd, yearling herd, pair of calves, get of sire, produce of cow, best four cows—Hull Bros.

FIRST PRIZE 2-YEAR-OLD AYRSHIRE, ALTA CREST POWDER PUFF
OWNED BY ALTA CREST FARM, MASSACHUSETTS

How to Make Stack Silage

Because there are probably not silos enough to take care of the immature corn crop this year, the feeding value of corn may be partly lost. Many farmers without silos will have soft corn.

"Those who have cows to feed and who feel they cannot afford one of the standard silos will do well to consider making stack silage of a good part of their corn crop," says Andrew Boss of University Farm. "That this can be done successfully with green bundle corn has been demonstrated in numerous instances by farmers. Stack silage is also successfully made of the corn husks and pea vines at canneries. The stack method is not so satisfactory as the use of a regular silo, but it is a reasonably satisfactory way of preserving green corn."

Professor Boss says that C. L. McNelly, county agent in Fillmore county, has made stack silage for four seasons on his farm in McIntosh, Minn., and recommends it in preference to bundle fodder corn. Mr. McNelly gives the following directions:

Make the stack about 20 feet in diameter and about 20 feet high. Keep the center lower than the outside until the top is reached when it should be filled full. A swinging pole derrick and some two-rope or "common sense" slings with which to pull up the bundles of green corn will greatly lighten the labor. Three or four slings will be needed for each load of bundles. As the sling loads are dropped on the stack near the center they help to pack it. The bundles must be distributed evenly over the surface with the butts laid to the outside. The stack will then settle evenly and firmly.

In feeding during the winter the top of the stack is kept covered with a foot or two of wild hay which can be thrown back as the silage is taken off. After a day's feed has been thrown down the hay should be replaced. This, together with the heat furnished by the fermentation of the silage, prevents extreme freezing.

Corn preserved in this way will rot in for about eight inches on the outside of the stack. Since these are the butts of the stalks the loss is not serious. The middle portion of the stack is readily thrown off for feed. The silage cures somewhat differently from the common corn silage in that it seems to develop less acid. There is a sweet molasses odor and flavor which makes it palatable and all kinds of stock eat it readily.

Georgia at Dairy Show

HOARD'S DAIRYMAN:—Georgia will be represented at the National Dairy Show this year by one of the most unique exhibits ever sent north by a southern state. The exhibit will be that of the Georgia Association—an organization of Georgia bankers, business man, and farmers pledged to aid in the agricultural development of the state. It will be devoted to showing the farmer of the Middle West what Georgia is doing in the way of improving her live stock as well as demonstrating what the Empire State has to offer the farmer who wishes to come South.

In the first place, there will be two pyramids of dairy butter showing the increase in production from 1919 to 1924. This increase has been 5,000 per cent. Then there will be an exhibit of cheeses made in the mountains of Georgia. Georgia cheesemakers have competed successfully with those of Wisconsin and New York, and the manufacture of this product has increased several thousand per cent in the last three years. Another feature of the exhibit will show the many different kinds of feed and forage crops that can be grown in Georgia.

In addition to the exhibits which will be important and instructive, there will be charts showing the comparative costs of land, buildings, feeding, and marketing between Georgia and other dairy sections; charts showing the distribution of markets for dairy products in the state; outlines of the Georgia association's plan of county organization and details of its land settlement plan and "Cow, Hog, and Hen" program.

Georgia. J. H. REED.

National Dairy Exposition

Milwaukee—State Fair Grounds
September 27th to October 4th

Wadhams Oil Company

is a firm believer in the business creed of rendering full value for cost. And it carries its advocacy and support of this principle beyond its own domain to all fields and industries which observe the doctrine of benefitting communities and producing increased returns for money and labor invested.

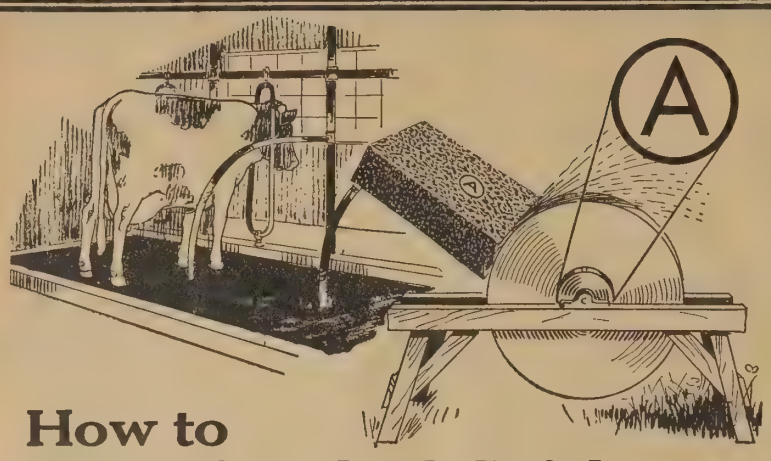
Therefore this space—usually devoted to Wadhams Tempered Motor Oil—is dedicated to

The Dairy Industry

Now in National Convention and Exhibition in Milwaukee

This is more than a "show." It is a giant manifestation of a giant industry, surpassing in extent and interest every previous event of its kind.

Fittingly, it is conducted in Milwaukee, the central city of the nation's greatest dairy state.



For the broad economic reasons first set forth and because of intimate interest in every movement for the advancement of dairy stock and products, the Wadhams Oil Company warmly welcomes to its home city the officers, guests and visitors of this great enterprise.

And this welcome is not limited to the brief week of this single Exposition but extends through the years when, it is hoped, Milwaukee will be the *permanent* home of the annual National Dairy Exposition.

You are urged to attend and to make the exhibit booth of Wadhams Tempered Motor Oil your place to rest and meet friends.

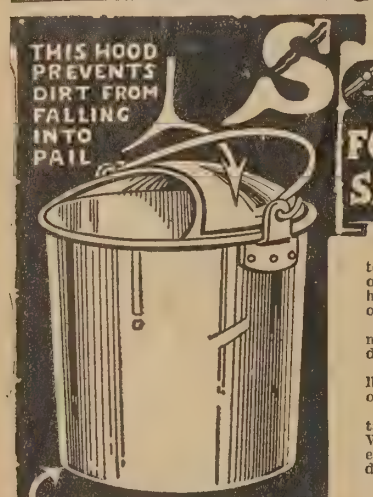
Proprietor Cramer's Farm, (*Holstein-Friesians*) Hartland, Wisconsin

How to Wear Out Cork Brick



YOU might try a grindstone. That would cut it down—in time. But you will be surprised how long Circle A Cork Brick will stand even that.

No wonder, then, that in stall floors, ordinary barn wear has but little effect. Circle A Cork Brick floors last for many years. Usually they need no repairs. Occasionally, a restless cow may hollow out a few bricks, but these are easily replaced at small cost and little labor.

For economy alone, it pays to floor your barn with Circle A Cork Brick. And when *in addition* to economy, you also get warmth and comfort and safety under foot, there is no argument about it: Circle A Cork Brick is the best floor you can lay in a dairy barn.

Write for the 32-page book, "Circle A Cork Brick", and a sample. Address Armstrong Cork & Insulation Company, 112 Twenty-fourth Street, Pittsburgh, Pa.

Circle A Cork Brick Floors
FOR DAIRY BARNS AND HOG HOUSES

Send No Money

FOR THIS DURO SEAMLESS SANITARY MILK PAIL.

Bottom and sides are one piece. Both interior and exterior surfaces are perfectly smooth, so there are no seams or crevices to harbor bacteria. The Duro Pail is made of heavy gauge steel heavily tinned, and will give a lifetime of service.

The Duro Seamless Hooded Milk Pail is strongly recommended by dairy authorities, for its use prevents dust and dirt from falling into the milk pail during milking.

Duro Pails are made in 14-qt. size only, and weigh 7 lbs. each. They may be supplied without hood when so ordered.

Send your name and address today and the Duro Sanitary Seamless Hooded Milk Pail will be shipped at once. When delivered pay the postman $2.25, (and a few cents extra for postage). Money refunded if at the end of 10 days you are not thoroughly satisfied with your purchase.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

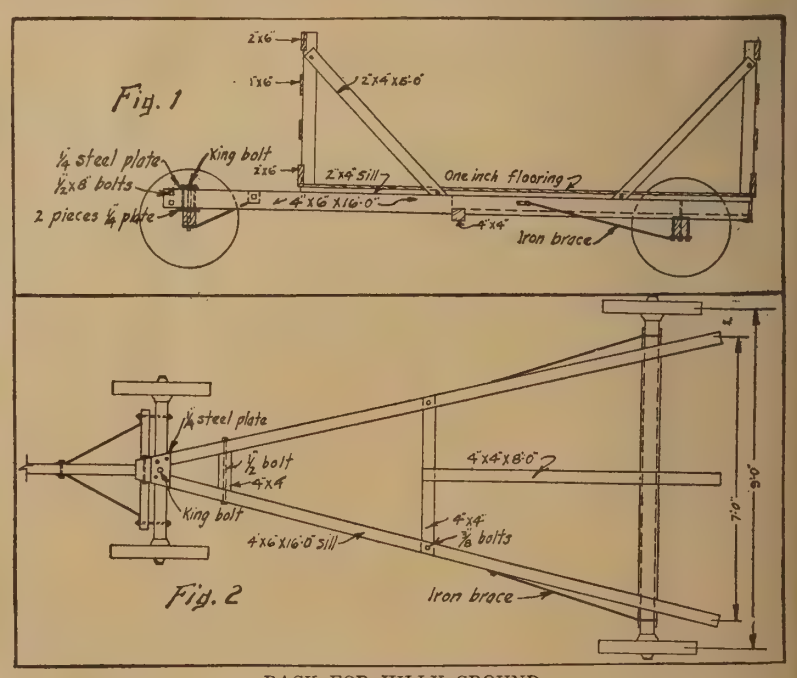
Two Types of Low Down Racks

N. S. FISH, Wisconsin College of Agriculture

HOW many times have you wished for a low down rack, only not to have it because you thought it too troublesome or too hard to make? Some farmers have found such racks or wagons to be one of the most handy and labor saving implements on the farm.

A low down rack is built low enough to enable the driver to pitch a load on himself, thus eliminating the pitchers in the field. The elimination of the pitcher means the reduction of several men on a crew. This is of considerable importance to the farmer who has to contend with high wages and scarcity of labor.



Many other things, such as fertilizers, fence posts, and fencing, can be more easily handled on low down racks. Lifting that extra foot or two tires one and this is what the low down rack overcomes.

RACK FOR HAULING SILAGE

Figures 1, 2, and 3 illustrate a low down rack that can be built by taking the running gears from any old farm wagon. It is not necessary to buy wheels of less diameter as the sills are beneath the gears, as shown in Figure 1. Figure 2 is a detail showing connection of the sills with the front running gears and Figure 3 for the rear gear. It will be noticed from the drawings that it is not necessary to do any remodeling of either gears to make this type of rack.

Two by fours are placed upon the sills and the flooring runs lengthwise as shown in Figure 2. The flooring can be run crosswise using 2"x4" strips on the side, thus eliminating the use of 2"x4" joists. This rack is well adapted for hauling corn from field to cutter.

RACK FOR HILLY GROUND

Figures 1 and 2 illustrate another type of rack. This type is well adapted for hilly sections. The sills are placed above the running gears while the other rack has them below. With this type it is necessary to have wheels of not more than thirty inches in diameter to make the sills low enough.

The rear axle is spliced to make the tread nine feet in width. This can be done by using a 4"x6" and a 2"x8" and clamping the stubs between by use of large U-bolts. The sills are of the same size as in the other rack, being bolted in the form of a V, having a spread of seven feet at the rear end.

The rack can be made eight feet wide by twelve or more long. By limiting the length of the rack to twelve feet, a driving platform can be placed on the frame in front of the rack.

If one would not care to splice the rear axle to make it wider, a standard axle could be used. In this case the wheels could project through the floor making it necessary to build a housing over them.

The construction of the baskets for either type can be made as shown or similar to the average bundle rack.

Silage Cuts Cost of Milk

A comparison between two dairy rations, one consisting of alfalfa hay, a good grain mixture, and corn silage; the other, alfalfa hay, the same grain mixture but no silage, made at the Purdue University Agricultural Experiment Station, showed that the ration containing a succulent roughage produced milk for fifteen cents per hundred pounds less than the no-silage ration, and animals fed this ration maintained their live weight during the test while the cows receiving the no-silage ration lost in live weight. The two rations were compared under similar conditions and were conducted in such a way that they apply to any dairy farm in Indiana.

The grain ration consisted of a mixture of ground corn, ground oats, wheat bran, gluten feed, and cottonseed meal. The grain was fed according to the amount of milk produced daily. The alfalfa hay was fed at the rate of two pounds per day for each hundred pounds live weight with the no-silage ration, while only half of this amount was fed with the silage ration. Silage was fed according to the live weight of the animals, about three pounds being allowed daily for each hundred pounds of live weight.

Records were kept of the milk and butterfat produced. The animals were so selected that the two groups (4 cows in each group) produced practically the same amounts of milk at the start. Group one, or the silage fed group, increased their production for a short time while the other group began to decrease in production immediately.

As the stage of lactation advanced, the production would of necessity decrease, but group one maintained its production much more evenly and over a longer period than the other group. The difference in maintaining live weight must also be considered. Group one maintained its live weight, while the other group lost about one and one-half pounds per animal per day during the time the no-silage ration was fed. This loss in live weight was not due to under-feeding. When calculated according to modern feeding standards, the no-silage ration provided 53 per cent more protein than the required amount, and 35 per cent more than the ration fed to Group one.

The feed required to produce 100 pounds of milk by each ration is of importance. Group 1 (silage group) required 25.8 pounds grain, 39.3 pounds hay, and 119.2 pounds silage for each 100 pounds of milk produced. Group 2 required 27.5 lbs. grain and 88.4 pounds hay. This shows that 119.2 lbs. silage replaced 49.1 lbs. hay and 1.7 pounds of grain. Figuring grain at $2.00 per hundred and alfalfa at $15.00 per ton the silage returned $6.75 per ton. But this is not all. Group one produced 15 per cent more milk during the test than the no-silage group.

The comparison between the two rations indicates three advantages in favor of the use of silage in the ration:

1. The saving in the cost of production of 15 cents per hundred pounds of milk.

2. Maintaining live weight of animals.

3. An increase of 15 per cent in milk production.

The results of this comparison would seem to indicate the advisability of more general use of silage in Indiana. This is especially true where a liberal supply of alfalfa hay is not available and the corn crop is not ensiled. Not only is the corn fodder less palatable than the silage but considerable waste occurs when the crop is being fed during the winter.—Purdue College of Agriculture.

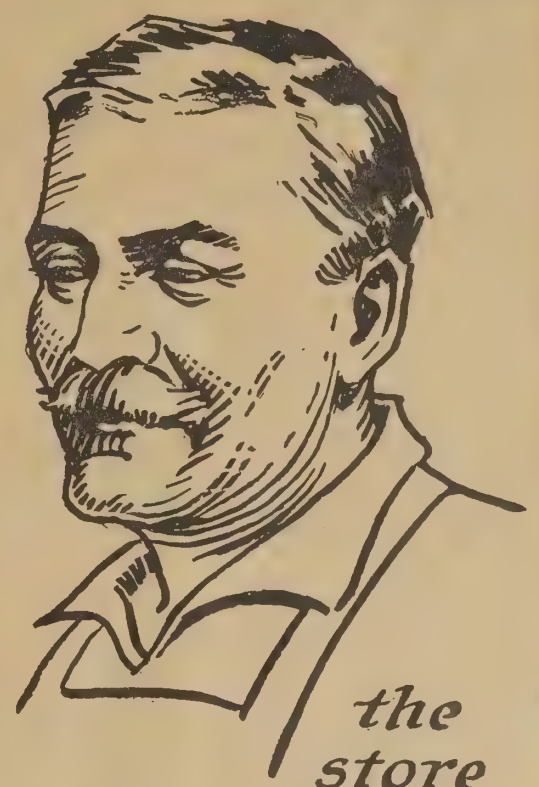
IMP. DOT OF MILL FARM, OWNED BY QUINEILO FARMS CO. OF WISCONSIN

This Guernsey cow recently completed a record of 11,689.7 lbs. milk containing 531.48 lbs. butterfat in Class E. The heifer was given the same care and feed received by the rest of the milking herd and was milked but twice daily.

Nebraska Creamery Course

The dairy industry, unlike many industries, is not confined to any one locality. This with the steady growth affords an opportunity for well trained men. Proper training for such work is only obtained by actually performing the different operations. This with a knowledge of the underlying principles must be understood to successfully handle such perishable product as milk. Those interested in the industry may obtain such a course at the Nebraska College of Agriculture.

The course is open to those having completed the eighth grade or those having had practical experience in creamery work. The student should be in good health and willing to work. There is no tuition but a fee of $10.00 is required. Necessary books, white suits, and rubber shoes will cost $15 to $20 per student. Board and room may be obtained near the campus for from $6 to $10 per week.



The dairy building is fully equipped and the creamery is run on a commercial basis. Various dairy products are manufactured and sold, including market milk, cream, butter, ice cream, lactone buttermilk, malted milk, cottage and cheddar cheese. A complete refrigerating system is contained in the building.

The course starts October 6th, 1924, and finishes April 17th, 1925. Those desiring further information may address Professor H. P. Davis, Dairy Husbandry Department, University of Nebraska, Lincoln, Nebraska.

Uncle Ab says most folks can afford to make a trade at the rate of about a dozen opinions for one real conviction.

"LATE deliveries make dissatisfied customers and high tire costs cut my profits—so I use Red-Tops. They're the only tires I can really depend on to keep my car on the job every hour day in and day out."

The secret of Red-Top's ability to stand more hard knocks than other tires is found in its extra ply and its extra heavy tough red tread. This heavier and stronger construction adds thousands of miles to its life.

SATURDAY, OCT. 4

Final Day of the National Dairy Exposition.

Champion Four-year Producer

ADIRONDAC WIETSKE DAIRY MAID, OWNED BY BRIDGFORD HOLSTEIN CO., CALIFORNIA

A PRODUCTION of over 31,500 lbs. milk and 1,000 lbs. butterfat in one year for the fourth consecutive time, makes Adirondac Wietske Dairy Maid, an eleven-year-old pure-bred Holstein-Friesian, the only cow in the world to hold such a record. She recently completed her last yearly period with 31,517 pounds milk and 1,005.82 pounds butterfat, equivalent to 1,257.2 pounds butter, which, with the three records made in previous years, gives this cow an average production for four successive yearly tests of 32,349.9 pounds milk and 1,048.13 pounds butterfat, equivalent to 1,310.1 pounds butter. She is also the leading cow in the United States for ten months' production of both milk and butterfat with a record of 27,577.3 pounds milk and 872.12 pounds butterfat, made at ten years of age. All of her records mentioned were made in the herd of her owners, the Bridgford Holstein Company, California, after she was nearly eigh years of age.

Like all other cows on long-time test on the Bridgford farm, "Adirondac" was kept in a box stall with free access to an adjoining paddock. She was kept in the stall only in severe weather. From April to October she was run on pasture several hours each day. She never received special care or was pampered in any way, but always was kept in dry, well ventilated quarters. She received concentrates, four times a day at each milking the year round, consisting of a mixture of mill run, rolled barley, cracked corn, oil cake meal, and soy bean meal. The total weight of this grain mixture consumed each day varied from 12 to 15 pounds. To it was added dried beet pulp because of its slightly laxative and cooling effect. She received also all the alfalfa hay she would clean up twice daily and during the summer months was given green cut alfalfa twice a day. This was replaced by corn silage from November to May.—Holstein-Friesian Extension Service.

The Kind of Lime to Use

Ground limestone, screenings, burned lime, hydrated lime, air-slaked lime, shells, refuse lime and marl may all be used for neutralizing soil acidity. Which of these different forms of lime should be used in any particular case should be determined by the cost at which a given amount of calcium carbonate or its equivalent, in a reasonably fine condition, can be delivered to the soil. Aside from this, there is no good reason for discriminating against any of these materials. Neither should magnesium limestone be considered either more or less valuable than the ordinary calcium limestone.

Theoretically, 100 pounds of finely ground limestone, 56 pounds of freshly burned lime, 74 pounds of hydrated lime, and about 90 pounds of air-slaked lime have equal acid neutralizing power. In calculating the cost, the price of the material, the freight if any, the cost of hauling and the labor involved in spreading it on the land, should be taken into account. If finely ground limestone can be secured delivered at the nearest railroad station at $3.00 per ton, then, allowing for the smaller cost of handling equivalent amounts of the more concentrated forms, fresh burnt lime should be secured at the station for $6.00, hydrated lime for $4.50, and air-slaked lime for about $3.50 per ton.

Usually ground limestone will be the most economical and most satisfactory material to use. In considering the price, the fineness of grinding and the freight rate must be taken into account. The fine material is worth more than the coarse. If coarse material is used, it will require more to get the same immediate acid neutralizing effect. A good grade of ground limestone should be fine enough so that all will pass through a 100-mesh sieve. The objection to coarse material, such as screenings, is that it acts too slowly. Only the fine dust will act immediately.—Purdue College of Agriculture.

Reduced Railroad Rates

A reminder on the reduced railroad rates granted visitors to the National Dairy Exposition, opening at Milwaukee, Wis., on Sept. 27, is given those who have not definitely acted in the matter of securing transportation. An open rate of a fare and a third is granted, without certificate, to the following territory: Eastern Montana, Illinois, Kansas, Missouri, Nebraska, Minnesota, North and South Dakota, Iowa, Northern Michigan, and Wisconsin. A fare and a half rate, with certificates, is offered those who wish to attend conventions held in connection with the exposition. For persons farther away from the territory mentioned, a fare and a half rate, with certificate, is offered to all. A special fare and a half rate from Chicago is also offered by one road.

Advertising

A subscriber to a Missouri paper, once edited by Mark Twain, wrote him stating he had found a spider in his paper and wanted to know if it meant good or bad luck. Mark replied:

"Old Subscriber: Finding a spider in your paper was neither good luck nor bad luck for you. The spider was merely looking over our paper to see which merchant is not advertising, so that he can go to that store, spin his web across the door, and live a life of undisturbed peace afterward."—The Clay Worker.

Trees are the shelter of man and beast and bird.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

Washington, D. C., Sept. 16.—The Bureau of Dairying of the U. S. Department of Agriculture will be about as well represented at the National Dairy Exposition this year as usual. In addition to the big special exhibit, along lines described some weeks ago, there will be a laboratory equipment and a number of the members of the staff of the Bureau to be of all possible assistance by explaining the exhibit, and putting inquirers in touch with the ways in which the Bureau may be of service to those engaged in any part of the dairy industry. Dr. Larson, chief of the Bureau, will spend most of his time at the show in Milwaukee and has already made arrangements to speak at various gatherings to be held there. Dr. Rogers, chief of the Laboratory Service, will not remain for the full week in Milwaukee, because of other engagements calling him back to Washington. The Dairy and Poultry Markets section of the Bureau of Agricultural Economics will be represented as usual by Roy C. Potts, and several assistants and their exhibits will be installed as usual as a part of the general Department of Agriculture exhibit.

The proceedings of the World's Dairy Congress are finally available for distribution. Proof reading was handled through the Dairy Division, and the document is printed as a congressional document. There are nearly 1600 pages of the text with many charts and other additions.

The importance of the new ruling from the Treasury Department as to adulterated butter was so great that as soon as a copy was available the National Dairy Union had copies made and forwarded to all members, as well as to the dairy and agricultural press. This Treasury Decision was issued to clear up the situation created by the U. S. Supreme Court decision in the Tilden Produce Case invalidating the previous ruling which held that all butter containing over 16 per cent of moisture was *per se*, adulterated. The new ruling quotes the law to the effect that if in the manufacture of butter any process or material is used for the purpose or result of incorporating an abnormal quantity of moisture, milk, or cream, such butter is adulterated. It then proceeds to cite the result of thousands of analyses to the effect that butter with over 15 per cent of moisture will be under suspicion of being adulterated. The language of the decision, however, indicates that in every case the method of manufacture will be the test as to whether or not adulteration has been practiced and not the per cent of moisture by itself. The whole matter is still far from in a workable condition, it is believed by most persons carefully in touch with the situation, as the necessity of proving the method of manufacture in each case is considered as practically prohibitive of general enforcement of the law. There is, therefore, every likelihood of an effort to get clarifying legislation in the next session of Congress.

Mr. Hobson, the American delegate on the permanent committee of the International Institute of Agriculture, is here for a month, dividing his time between Washington and visits to large agricultural organizations that may be interested in improvement of the statistician and other services of the institute. He expects to visit the National Dairy Exposition to confer with the leaders of the industry.

W. S. Moscrip of the Twin City Milk Producers' Association, and also representing the Minnesota Co-operative Creameries and the Holstein-Friesian Association, spent several days here in the interest of maintaining and increasing the tariff on butter. He was received by President Coolidge and spent some time in conference with the chairman and staff of the U. S. Tariff Commission. He found that there was no foundation for a report that the commission had made any adverse report or even begun work on a report on the application for an increase in the tariff, but that the investigation was still in progress, both in Denmark and in this country, and that it would be some weeks before the investigations were ended and notice of public hearing could be given. There will be at least a thirty-day notice before a public hearing and no final decision until after such hearing and opportunity for all interested parties to be heard.

The banquet committee of the American Dairy Federation, in charge of the banquet to be given at Milwaukee on the evening of October 1, has announced the complete program as follows:

Time, October 1, six p. m.; place, Hotel Pfister, Milwaukee. Presiding, Hon. Frank O. Lowden, president of the American Dairy Federation.

Speakers: Hon. Herbert Hoover, Secretary of Commerce, Washington, D. C.; Harry A. Wheeler, former president United States Chamber of Commerce, Chicago, Ill.; Dr. Lee K. Frankell, vice-president of the Metropolitan Life Insurance Co., New York City; Dean H. L. Russell, Wisconsin State College of Agriculture, Madison, Wis.

Reservations to the number of several hundred have already been received. A. M. Loomis, secretary of the Federation, and acting for the banquet committee, states that while invitations have been sent generally, the attendance is not limited to those who receive invitations but the public will be admitted so far as space will permit, after sufficient reservations have been made to assure that the dairy industry representatives are all taken care of. Tickets will be available at several places in Milwaukee.

When—feeders say this

Quality as Well as Quantity

"I have used Larro for over 9 years and there is nothing that will duplicate it. Larro is the best milk feed there is. It does increase milk production."
JOSEPH NOWAK, Thompsonville, Conn.

"We have a herd of 15 Holstein cows which give nearly as much milk as some of our neighbors who are milking 25. My father says it is all in the feed. We feed Larro."
H. E. COLE, Epping, N. H.

Good Condition and High Production

"We have fed enough Larro to test it thorougly. We find it an excellent milk producer—at the same time keeping the heavy producer in good flesh."
O. O. BUSCHLEN, Bad Axe, Mich.

"My cows are in the 'pink' of condition and produce heavily. Four of my cows have tipped the scale at 60 lbs. of milk in one day; two of them have reached 65¾ and 64¼ lbs.—cows that were producing very little milk on all kinds of miscellaneous feeds. This is my result from feeding Larro and I shall continue to feed same as long as I have cows."
A. HERBERT, Westport, Mass.

Larro for Long-Time Results

"We started with one cow for our own family use and now we are keeping between 400 and 500 head on our farm, and the cows we started with and have been milking for more than 12 years are yet profitable producers. We are glad that we commenced our dairying experience in feeding Larro and have never changed since our beginning with our family milk cow."
WHITE BELT DAIRY, Lemon City, Fla.

"Your feed is the best feed on the market, as it produces the richest milk and cream. We have tried other feeds but have not found them satisfactory. We have used Larro for over 7 yrs." H. A. COUCH, New Milford, Conn.

"We have fed Larro along with other dairy rations and it gives us better results than any we have tried. We also find the longer we keep the cows on Larro, the better they milk."
W. B. BRADSHAW, Cartersville, Ga.

Where Other Feeds Had Failed

"My first sack of Larro ruined my patronage for other feeds with the exception of Larro. From that one sack I got an increase in milk and as I kept on using Larro I got better results. I wouldn't give one sack of Larro for any two sacks of other feed I have ever used."
E. H. BAKER, Ironton, Ohio.

"We have been feeding Larro for several months in a test with several orher feeds, with results which are highly favorable to Larro."
PEYTON T. GISH, Mt. Sydney, Va.

For Young Stock and Old

"I have two cows milking 100 lbs. of milk on 10 lbs. of feed apiece a day. I could get alfalfa, I think I could get 60 lbs. from these cows apiece on 12 lbs. of Larro. One of these cows is 7 years old."
C. C. ROBINSON, Annapolis, Md.

"We think Larro feed is certainly great, and our whole herd looks fat and nice, and has produced lots of milk this winter We have one cow 14 years old that gives 42 lbs. of milk a day. We feed the calves on Larro and like the feed.'
L. E. WETMORE, Canfield, Ohio

For Economy and Profit

"I have thoroughly tried out practically all standard makes of dairy feed and mixed many kinds myself, but have found nothing which will produce as much milk of fine quality—a regular amount—and keep the cows in fine condition like Larro does. It will give me at least 15% to 25% more profit than anything else I have ever found. If I had used it exclusively for the past five years, I would have saved many thousands of dollars.'
LORING BROWN, Orlando, Fla.

"I use Larro as ever and am satisfied with the results from it. I did try some cheaper feeds, but lost out in production and was out money in the long run."
LAWRENCE BACHMAN, Tarentum, Pa.

Larrowe Bldg. THE LARROWE MILLING COMPANY Detroit, Michigan

What-is there left for us to say?

The SAFE Ration for Dairy Cows

This Warford equipped Ford truck stood in the public square at Henderson, Texas, where it attracted hundreds of people from all parts of the Lone Star State. The actual load weight on the scales was 17,255 lbs. Weight shown on the poster, 15,915 lbs., was estimated from the footage.

The Heavy Truck Needs a New Alibi

You wouldn't expect to haul eight and one-half tons with a Ford truck as a regular practice, but it is worth something to know that your Ford could do it.

Every day, Warford, the Two-Ton Transmission for Ford trucks, is shattering that carefully built up tradition of the heavy truck makers—that a motor truck must weigh as much as the load it hauls.

Thirty thousand Warford users know this assertion is false. They know that a 200 pound man can sit in comfort and safety in a 20 pound chair. They know that the Warford equipped Ford truck will give the same performance as any standard two-ton or speed truck at one-third the first cost and with Ford one-ton operating economy.

"A Speed for Every Need."

To Make Farming More Profitable

Fordson

To make farming more profitable—to make the farmer's life and the lives of his family happier and more abundant, is the aim of the Ford Motor Company in manufacturing the Fordson Tractor.

For by helping him to get more work done in less time and at less cost than formerly, the Fordson Tractor lightens the farmer's burden.

The vast resources of the Ford organization and the highly scientific factory methods which produce them so economically in such large numbers, and of such splendid quality, make possible the low cost price of Fordson Tractors and their superb performance.

Nowhere can the American farmer secure for so little a Tractor that will accomplish so much. The Fordson Tractor is a practical, time-saving aid in plowing, harrowing, planting, mowing, harvesting, threshing, road-mending and scraping, timber-cutting and sawing, hauling, pumping, excavating—in fact every duty the farmer must perform which requires power.

Ask your Fordson Dealer, or write us, for an actual demonstration, on your farm, of what the Fordson can do for you.

HOW TO SECURE PROFIT FROM COWS

The Cow Testing Association Points Way

J. C. McDOWELL, Bureau of Dairying

SOME time ago while riding on a street car in Washington, D. C., I overheard two high school girls talking about the West. In the course of the conversation they mentioned the word Wyoming. "What is Wyoming anyway," asked one of the girls. "Is it a city or a state?" The other girl replied, "Well, your ignorance is refreshing. Wyoming is a state. I guess I know that much, and I know its capital, too. Its capital is Salt Lake City."

The dairyman who keeps no records may be a pretty good guesser, but his knowledge of the production and feed cost of his cows is likely to be about as exact as the high school girls' knowledge of geography. Ever since Dr. Babcock, in the early nineties, discovered the test that bears his name, we have had no excuse for not knowing the production records of our dairy cows.

Ordinarily the cheapest and best way to get complete records of every individual cow in the herd is through the work of the cow testing association.

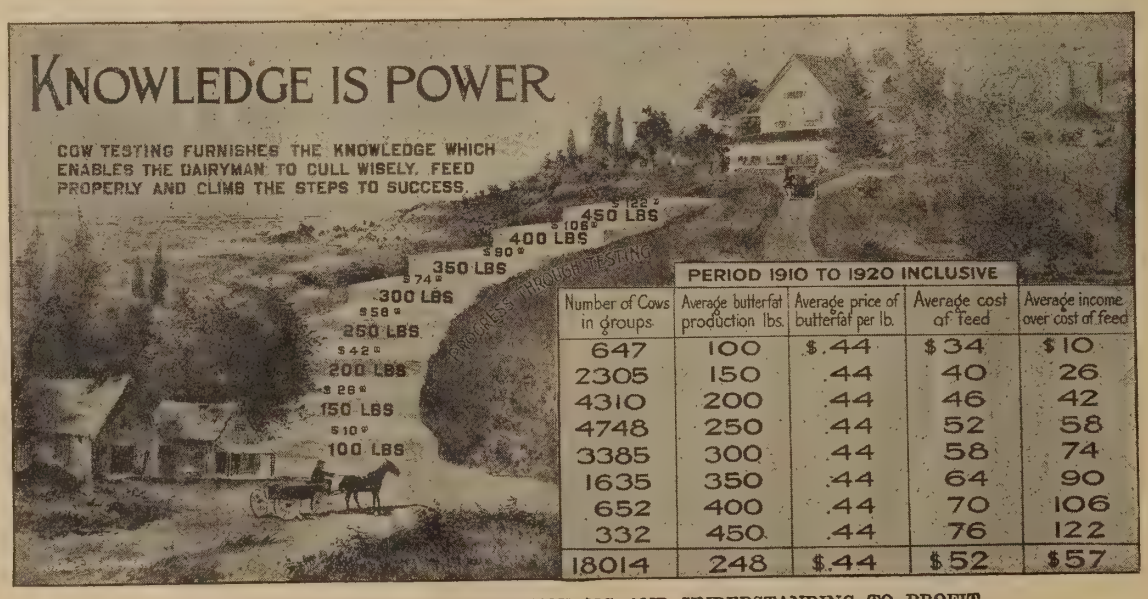
What is a Cow Testing Association?

A cow testing association, as ordinarily conducted in this country, is an organization of about twenty-six dairy farmers who cooperatively employ a man to weigh the feed and to weigh and test the milk of each cow one day each month. The tester not only weighs the feed and weighs and tests the milk, but he keeps feed cost and income records of each cow in the herd in order that the dairyman may cull, feed, and breed his herd intelligently.

Origin

Eighteen years ago last January the first cow testing association in the United States began work in Newaygo County, Michigan. Since then almost every year has seen a substantial increase in the number of associations until on July first, 1923, there were 627 associations widely distributed. In fact there is only one state in the Union that has the distinction of never having had a cow testing association. Since July 1, 1923, there has been quite a gain in the number of associations until today there are about 745.

What They Do



It is estimated that the average cow in the United States produces annually about 4,000 pounds of milk and 160 pounds of butterfat. The cow testing association cows produce at least 50 per cent more than that. This is shown in Department Bulletin 1069, entitled "Relation of Production to Income from Dairy Cows". That bulletin states that the average production of about 21,000 cow testing association cows was 6,077 pounds milk containing 248 pounds butterfat.

Knowledge is Power

At the National Dairy Show in Paul in 1921 a very attractive picture entitled "Knowledge is Power" was shown in the cow testing association booth. In that picture a stairway led upward from a hovel to a beautiful farm home. The stairway was labeled, "Progress Through Breeding". The riser beneath each step showed butterfat production in pounds, and the step itself showed income over cost of feed. The first riser showed a production of 100 pounds of butterfat a year per cow and an income over cost of feed of $10. Step by step the stairway showed the following figures giving the average production of each group of cows and the average income over cost of feed from the lowest to the highest producing group:

Butterfat production	Income over cost of feed
Lbs.	
100	$ 10
150	26
200	42
250	58
300	74
350	90
400	106
450	122

At the foot of the stairway a lazy farmer lives. He lives in a dilapidated hut, milks scrub cows, and over a rough and muddy road he drives an old plug horse hitched to a rickety wagon. The picture shows extreme poverty and indicates that the poverty is due to the kind of cows that farmer keeps.

KNOWLEDGE LEADS TO UNDERSTANDING AND UNDERSTANDING TO PROFIT

At the top of the stairway all is different. Here lives an up-to-date, progressive farmer. He lives in a fine farm house, owns well-bred, high producing dairy cows, and he drives along the smooth, level road in comfort in a high powered automobile. This picture shows a home of plenty and indicates that the prosperity is due to the kind of cows this farmer keeps.

The title to the entire panel on which these pictures were drawn is expressed in three words, "Knowledge is Power". Beneath that title these words are written: "Cow testing furnishes the knowledge which enables the dairyman to cull wisely, feed properly, and climb the steps to success." The figures are from a tabulation of several thousand individual cow records from various cow testing associations. The entire story is based on actual records from these associations.

Newaygo County, Michigan, Association

When the Newaygo, Michigan, association was organized the cows on members' farms were just about average cows, but the butterfat production the first year averaged 215 pounds per cow. Five years later it was 270 pounds per cow. This was the first association in the United States, and I am pleased to be able to state that the association is still in operation and that it has been in operation continuously since it began work in 1906, with the exception of a short period during the war, when the tester resigned to go into the army to fight for his country. It required a world war to stop even temporarily the work of that association.

Fairfax No. 1 Association, Virginia

The Fairfax, Virginia, association has been in operation only four years, but the average production per cow in that association last year was 8,066 pounds milk and 324 pounds butterfat. Mr. L. P. Emmerick, the cow tester last year, says in his annual report: "Fifteen of the herds in the association this past year have been in the cow testing association for at least three years. These fifteen herds, comprising 328 cow years, averaged 8,817 lbs. of milk and 347.8 lbs. fat. Herds that had been tested less than three years had a total of 296 cow years, and these cows averaged 7,572 pounds milk and 296.9 pounds fat."

Because of his great success in that association, the state agricultural college has placed Mr. Emmrick in charge of all the cow testing association work in the state of Virginia.

Grove City, Pennsylvania, Association

When the cow testing association was organized in the vicinity of Grove City the dairy cows were not above average in production. The first year, the association raised the average of all cows in the association to 225 pounds fat a year. This was done wholly through culling and better feeding, as one year is too short a time in which to get higher production through breeding. The production by years has been as follows: 1st year, 225 pounds; 2nd year, 261 pounds; 3rd year, 280 pounds; 4th year, 298 pounds; 5th year, 303 pounds; 6th year, 308 pounds.

These figures are typical of many associations. During the first three or four years the gain is rapid, and after that production advances more slowly. This shows that it is easier to climb from a low level to a higher level than it is to climb upward for a production that is already high. No association, however, has yet reached so high a level that it cannot go higher.

Continued Testing Pays

Some one may think that because it is difficult to raise average butterfat production much above three hundred pounds, the work of the associated members is done when their herds have reached that high level of production. Far from it. If they stop testing now the herds will soon drop back to where they were before. It is not enough to place the herd on a profitable basis, but it must be kept there. For that reason every cow testing association member should plan to stay in the association as long as he stays in the dairy business. Those who are in should stay in, and those who are not in should get in as soon as ever they can. It pays to test.

Mr. Emmerick's figures show that the herds that had been on test in the Fairfax association more than three years produced 1,245 pounds more milk and 50.9 pounds more butterfat than those that had been on test less than three years. This was a gain of 16.4 per cent in milk and 17.1 per cent in butterfat production, which is evidence that continued testing pays.

Where are We Going?

A friend of mine, Sam Brown of Montana, is a young man six feet two. He is very bright and witty, but he always stutters when he gets excited. One day he and I were on a train traveling across Wisconsin as far as the city of Portage. Sam had never been in Wisconsin before, so the name Portage was new to him. The conductor took our tickets, punched a slip, and put the slip in my hat. After lunch, when we returned from the diner, we discovered that our seats in the day coach had been taken by two ladies. I found a seat in that coach, but Sam went into the next coach ahead.

Pretty soon the conductor came along and seeing no slip in Sam's hat held out his hand saying, "Ticket, please." Sam felt for his ticket, but not finding it he became excited and began to stutter. The conductor asked: "Well, where are you going?" By this time Sam was so excited that he had completely forgotten the name of the station. In telling me about it afterward, he said: "Th—Th—there I was, a full-grown man. I—I—I didn't have any ti—ti—ticket and di—didn't know where I was going."

I sometimes think that those of us who are in the dairy business with low producing scrub dairy cattle are about in the same fix as Sam when he didn't have any ticket and didn't know where he was going. Why not join a cow testing association and at least find out where we are going?

Caroline Segis De Kol Pontiac is now Arizona's leading cow of the breed for production in one year as a junior three-year-old. Her record is 15,274.3 pounds milk and 570.42 pounds butterfat, equivalent to 713 pounds butter. She is owned by the U. S. Bureau of Animal Industry at Woodward.—Extension Service, Holstein-Friesian Ass'n. of America.

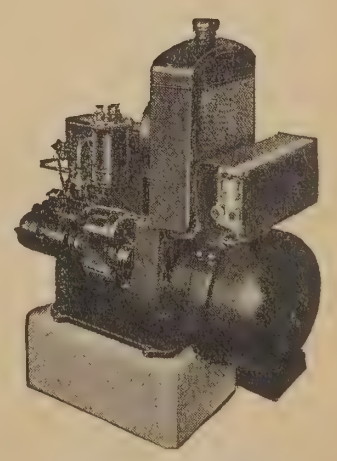
Get the most out of electricity —choose a *powerful* plant

THE Kohler Automatic, even in the smallest size, is a *power* plant that will take a hundred hard, monotonous tasks and turn them into play.

It will do that *in addition* to its big job of giving your family plenty of light for work hours and leisure hours, of safely lighting your buildings, and of furnishing power for automatically pumping fresh running water wherever you want it.

Grinding and drilling, cream-separating and churning, washing and ironing, sawing wood and shelling corn—these are only a few of the things that any Kohler Automatic will do, cheerfully and well, whenever you ask it.

The Kohler Automatic is designed to render a *complete* electrical service on the farm. It has exclusive advantages which enable you to get more work out of electricity. It has the all-important advantage of *not needing storage batteries* (except a small starting battery for automatic operation).



Its current flows, without waste, direct from the generator to the job. Full rated capacity is always on tap, with no danger of damage from occasional overload. Automatic operation saves visiting the plant. Its 110-volt current can be carried long distances, and permits the use of standard appliances.

There are Kohler Automatics ranging in capacity from 800 to 2000 watts, adapted to the needs of small farms or large. All models may be bought on convenient terms.

Let us send you the 48-page Kohler Automatic booklet. The coupon will bring you this interesting booklet by return mail.

"OUR Kohler unit has now been installed for two years and has performed to our entire satisfaction. It not only furnishes us with electric lights for our home, but also runs the electric iron, automatic electric water system, washing machine, cream separator, vacuum cleaner, and our 32-foot grain elevator. We feel that our Kohler is good for many more years of service."

LUCY THOMPSON

Rub, Scrub, Rub

Not near all Dairyman readers are fortunate enough to have nice, shiny, white bathtubs but we are all going to some time. Putting hope into our work is almost as good as having an assistant to help us do it and, with farm affairs taking a good turn, there are few of us who cannot afford to be optimistic.

It is good to be optimistic about something concrete, too, rather than in a vague way. It may not appeal to you but for my part it is hard to hope and plan for anything about the home that is nicer than a well equipped bathroom.

There are all sorts of baths and we know more all the time about their curative value. Cold baths and hot baths for stimulation, tepid baths for relaxing, foot baths for headaches, shower baths for joy of life (how I do want a shower bath!), and then just baths for cleanliness.

If you already have a bath tub and at the same time have small children (men are nearly as bad, though don't breathe it) you know how hard it is to keep that dark line from staring you in the eye after each time a child has bathed.

I have a friend who did a smart and useful thing. She watched the advertising sections until she found a picture in pretty colors that showed a child washing a bath tub. I suppose it was to advertise something so simple that "even a child can use it." Anyway, she cut it out and pasted it on a piece of tan cardboard that made a nice background for it and underneath it she printed this verse:

"Rub the tub,
Scrub the tub,
When your bath is done.
Leave it white,
Shining bright,
Like the morning sun.
If you should be next, you see,
You'd be the lucky one.
Rub, scrub, rub."

Put on in that up-and-down fashion it can make a very attractive picture to hang on the wall at the faucet end of the tub where it will be most frequently seen.

There is no use in thinking that any one thing will work indefinitely with a child but my friend stoutly insisted that the fun of this verse lasted long enough to establish her child in tub-cleaning habits. If your chief trouble is the men, you'll have no trouble at all in getting an appropriate picture for them.

Turnip Greens Again

Who would have thought that so many readers would be interested in a thing like turnip greens? It goes to show that it is often the little things that surprise us.

I had an interesting letter from a Pennsylvania reader in which she says:

"Evidently you have never eaten real turnip greens. In the South where turnips winter safely in the ground, a new growth comes up in the spring (February is the month in the part where I am acquainted). This new growth is not only smooth and tender but of delicious flavor—quite the best greens that grow in that section."

I am so glad Mrs. Huskin wrote in for I am hearing more all the time from people who study it about how important it is that we have some green things to eat. Surely there is no simpler way than this to have them if you live far enough south. Now that it is called to my mind, I remember having seen these delicious shoots of turnips as far north as Kansas so I guess you don't have to be below the Mason and Dixon line to grow your own winter greens. Let us hear from more of you who have good ideas tucked away in your heads.

Pepper Hash or Pepper Relish

This is a pickle that is especially nice for Christmas or for any occasion when you want to work in something red on your table. It is usually a little too expensive to be generally popular but many of us grow our own peppers and can afford a little fling in the way of making the meal look more appetizing.

Five dozen ripe, red, sweet peppers, sliced thin or chopped fine. May use green and red peppers in equal amounts. Five Spanish onions, two large heads of celery, chopped; two cups vinegar, one and one-half tablespoons salt.

Cook all together slowly for fifteen minutes, then add two cups of brown sugar, and cook all at simmering temperature for about an hour. This must not be allowed to get soft and mushy. Put in glasses and cover with paraffin.

Oil Pickles

If you try these and don't say that they are wonderful pickles it must surely be that you don't like olive oil. It is very good for you, just the same, and to cultivate a taste for it is not a bad idea.

However, the other things in the pickle subdue the taste of the oil so that even those who think they have a distaste for it will hardly object to it. Then, too, if you want to try the recipe for these people, you can always substitute the vegetable oils such as the various salad oils that are now so much advertised. Their flavor is very mild.

It is only real "company" for whom I bring out this pickle because it goes so fast I never can keep any:

100 cucumbers about three inches long, 1 quart onions, ¼ pound mustard seed, ¼ pound celery seed, 1 teaspoon black pepper, 1 cup sugar, 1 quart vinegar, 1 pint olive oil.

Slice cucumbers and onions very thin and let stand in brine over night. In the morning drain, and if too salty, wash with clear water. Mix dry ingredients with vinegar and pour oil on rather slowly beating as you put it in. You can put the cucumbers and onions in a crock and pour this mixture over them or you can mix it all together and can it. I mix mine and put it up in the odds and ends of bottles and glasses we all have around the house, covering it with paraffin.

Don't be disturbed if your cucumbers are more than three inches long or if you don't have a hundred of them. I think that most of us have cooked long enough so that we can make substitutions without spoiling things. This is particularly true with recipes like this that have no cooking and are not easily spoiled. You will have to use your own judgment in regard to the vinegar. I think that any pickle is ruined by being too sour and usually dilute my vinegar about half but that will depend on its strength.

Dressing for Fruit Salad

Mix dry ingredients, add butter, beaten egg yolk, and syrup, slowly. Cook over boiling water until mixture thickens; cool and add cream, either plain or whipped. If you have fruit for the salad and you also have canned juices put into the dressing. For this recipe take:

1 teaspoon salt
2 teaspoons flour
1 teaspoon melted butter
1 egg yolk
½ cup cream
½ cup hot syrup from any tart fruit or from sweet pickled peaches or pears.

No time like summer, for having a a good refrigerator it is much easier to make this recipe multiplied several times and put it away as it keeps well.

Mint Sauce

Did you have any old fashioned mint in your garden this year? If so, you can make your winter supply of mint sauce before the final freeze gets it.

Take a jar full of vinegar—any size you think will be enough for the winter—and into this put mint leaves and stalks that have been finely chopped or well crushed. Let stand on the back of the stove where it is warm but not hot.

When you think the mint has sufficiently flavored the vinegar, strain it off into bottles and put away as you would fruit. When you are having lamb or mutton, mint sauce is almost indispensable and all you have to do is to dilute the vinegar if it is too strong and add some sugar.

I was cooking mutton one time last winter and had no mint sauce so I thought I would buy some but, for me, the price was out of reach. I used currant jelly and we thought it almost as good.

If you have saved any little fancy bottles you may be able to please some of your friends with mint sauce as a gift; for people who like it, no small gift could be nicer.

Fall Jellies

My mother has been spending the summer with me and you could almost tell it to look at my cellar shelves. Every time there was a little bit of anything around, she cooked it and popped it into a can with the result that I am afraid that I am going to have to buy more jars for the last of the pickling. It is a mighty comfortable feeling.

Mother brought me a new recipe for jelly that I am going to pass on to you. She thinks it is the best she has ever tasted and I am anxiously waiting for the ripening of the quinces so that I can try it.

Take two quarts of cranberries

No. 1255—Pajamas for boy or girl. Cut in sizes 2, 4, 6, 8, 10, and 12 years. Size 8 requires 2⅝ yards 36-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

"Did you make these biscuits, dear?"

"Yes, darling."

"Well, I would rather you would not make any more, sweetheart."

"Why not, my love?"

"Because, angel mine, you are too light for such heavy work."—Flamingo.

Prolong the Life of your Linoleum or Congoleum with Valspar!

The famous Valspar boiling water test

It pays to Valspar your hard-surfaced floor-coverings! This is the opinion of Mrs. C. E. Fisher of Greensburg, Pa., who wrote us recently the following very interesting letter:

"Some years ago, during spring house-cleaning, we gave our linoleum a coat of clear Valspar Varnish, and the result was so very gratifying that it has become part of cleanup season just as much as cleaning wall-paper and scrubbing paint.

"*First*, it saves the linoleum by offering a protective coat of hard varnish against daily wear; *second*, dirt and dust cannot be ground into the material, but are easily wiped or brushed away; *third*, the whole kitchen is brightened; and best of all, it is really clean."

If you will Valspar your Linoleum, Congoleum or Oil Cloth you will add greatly to its life and keep the surface bright and smiling. Spilled greases or acids will not spot it and repeated washings with hot, soapy water will never turn it white. A Valsparred surface is absolutely waterproof, and accident-proof.

Send the coupon below for sample—enough to cover 20 square feet of surface.

Remington

Heavy Duck Load
Long Range Load

12 and 16-gauge recommended for Duck, Brant, and Jack Rabbit. No. 4, 5 or 6 Chilled or Soft Shot

20-gauge—2¾ in. shells—recommended for Duck, Pheasant, Rabbit, Partridge, Prairie Chicken and Grouse. No. 6, 7 or 7½ Chilled or Soft Shot.

Remington Game Loads are scientifically loaded to a uniform standard of velocity, pattern and penetration with moderate recoil.. They are loaded exclusively with the finest American-made smokeless powders in Nitro Club *Wetproof* Shells. *Wetproof* means just what it says.

Remington Game Loads

Good Common Sense Applied to Shotgun Shells

UP to June, 1922—there was no such thing as a specific, standardized load for a *specific kind of game.*

Then Remington Game Loads were brought out. A few thousand sportsmen tried them.

And now in 1924—hundreds of thousands of men are shooting Remington Game Loads. Shipments are going out in carload lots.

Now, *why* have Remington Game Loads become so popular in such a short time?

Simply this. As every shooter knows, there never *had* been any previous standard in loaded shells.

Sportsmen held many opinions as to the best load for shooting any specific kind of game—ducks, for instance. There were 390 loads commonly used for shooting ducks. Naturally some of these were better than others. Probably half a dozen of these loads were really better than the other 384. Many sportsmen were *guessing* at the "best load." This was equally true of suitable loads for other game.

There are only a few really distinct varieties of game hunted with a shotgun. Yet there were 3200 "prescription" loads to hunt them with. The sportsman who didn't *know* the best load to use was often given an unsuitable one.

So, Remington in a common-sense way and with its unequalled facilities for finding out just what loads are *best* for each kind of game developed *Specific Loads for Specific Game—Game Loads.*

Every Remington Quail Load is the right load—the *best* load—for Quail—and the same is true of Remington Squirrel Loads, Duck Loads and so on through the whole Game Load line. Each load is made for a specific purpose.

Shoot Out the Facts

Remington provides you with shells made to a *predetermined performance* in the three necessary respects—the velocity or speed, the pattern or spread and the penetration, all with moderate recoil.

Remington Laboratory science takes the place of "guess-work" or hearsay recommendations. Remington has a definite basis of fact on which to recommend a specific load for a specific game.

No wonder hunters everywhere demand Remington Game Loads.

Study the picture opposite and the information under the boxes on this page. Select the Remington Game Load that is made to get the game you are going out after.

Get some Remington Game Loads and shoot out the facts *for yourself.*

Duck Load
Recommended for Duck, Pheasant, Hawk, Crow, Rabbit, Partridge, Prairie Chicken and Grouse. 12, 16 and 20-gauge; No. 5, 6 or 7 Chilled or Soft Shot.

Grouse Load
Recommended for Grouse, Prairie Chicken, Pheasant, Partridge, Dove, Rabbit, Duck and Squirrel. 12, 16 and 20-gauge; No. 7 Chilled or Soft Shot.

Buck Shot Load
Long Range Load
Recommended for Deer, Black Bear and Wolf. 12-gauge; loaded with 12 pellets of No. 0 Eastern Shot.

Quail Load
Recommended for Quail, Dove, Woodcock, Rail, Plover and Snipe. 12, 16, and 20-gauge; No. 8 Chilled or Soft Shot.

Rabbit Load
Recommended for Rabbit and Squirrel. 12, 16 and 20-gauge; No 6 Chilled or Soft Shot.

Squirrel Load
Recommended for Squirrel and Rabbit. 12, 16 and 20-gauge; No. 6 Chilled or Soft Shot.

Snipe Load
Recommended for Snipe, Rail, Plover, Woodcock and Quail. 12, 16 and 20-gauge. No. 9 Chilled or Soft Shot.

Goose Load
Long Range Load
Recommended for Goose, Fox, Turkey and Raccoon. 12-gauge; No. 2 Chilled or Soft Shot.

Dove Load
Recommended for Dove, Quail, Rabbit, Partridge, Plover, Grouse and Woodcock. 12, 16 and 20-gauge; No. 7½ Chilled or Soft Shot.

Memorable Days in a Knight

Coupe-Sedan
$1550
F·O·B TOLEDO

On school days, on shopping days, on Sundays, on all days of the calendar, season in and season out, the Willys-Knight Coupe-Sedan is keeping owners young and happy—a family car faithful to every trust, and smart and stylish as Fifth Avenue!

This is the car that made folding seats as old-fashioned as haircloth furniture. Doors both *front* and *rear* let everybody enter and leave without climbing over seats or feet. A Wilson-built Body—with the *capacity* of a sedan and the *sociability* of a coupe—finished in a beautiful color scheme of blue, black and nickel.

As fine as it looks, it is yet finer internally. The Willys-Knight sleeve-valve engine is famous around the world as *the engine that improves with use*—supremely smooth and quiet at any gait you drive! No valve-grinding. No bother with carbon. *None* of the clatter and griefs so often associated with ordinary poppet-valve engines.

You can have utter faith in Willys-Knight reliability. Owners report 50,000 miles and more without once having had a mechanic tinker with the engine. And in ten years of Willys-Knight history, no Willys-Knight engine has been known to wear out!

There is a definite social distinction in owning a Willys-Knight . . . abiding pride in its charm . . . lasting satisfaction in performance. The longer you drive the more you enjoy the driving—and the more value you attach to the car. Try a Knight on the road today!

Willys-Knight Models: 2-pass. Roadster $1175, 5-pass. Touring $1195, 7-pass. Touring $1325, 5-pass. Sedan $1695 (De Luxe $1895), 7-pass. Sedan $1995; all prices f. o. b. Toledo. We reserve the right to change prices and specifications without notice.

Willys-Overland, Inc., Toledo, O. Willys-Overland Sales Co. Ltd., Toronto, Can.

WILLYS-KNIGHT

and five or six large quinces that have been chopped fine. Boil these in three quarts of water until they are soft, being sure not to let them burn. After straining the juice through a jelly bag boil it about ten minutes in order to concentrate it.

Take equal parts of juice and sugar and boil about five minutes. The finest jelly is made in the small amounts but if you are in a hurry there is no law against boiling it three or four cups at a time. The quantity of this can be increased and the taste not much affected by using part apple juice. The jelly is a beautiful red and is fine served with meats.

The best jelly I have ever eaten was at a party lately and, while mother has never tasted it, she argues that it cannot equal the cranberry and quince combination. This jelly was made by boiling some tart apples and taking the apple juice with equal parts of the juice off canned (or fresh cooked) raspberries. The flavor is wonderful.

By the way, if for any reason you have not made jelly this summer you can do it this winter almost as well and as cheap. Buy the gallon tins of canned fruit, feed the fruit to the family, and make the juice into jelly. The gallons are much cheaper in proportion than the smaller sizes and the family needs the fruit in the diet.

Flies Don't Over-winter in Heated Houses

The prevailing opinion that the house fly lives through the winter as an adult, hiding in cracks and crevices of buildings, etc., appears to be erroneous. Under outdoor conditions house flies are killed during the first really cold nights, that is, when the temperature falls to about 15 or 10 degrees F. In rooms and similar places protected from winds and partially heated during the winter, flies have been kept alive in cages for long periods; but they never lived through the entire winter. In longevity experiments one record of 70 days and another of 91 days was obtained.

No uncaged house flies were found during three seasons' observations in unheated and only partially heated attics, stables, unused rooms, etc., where favorable temperature conditions prevailed. The common occurrence in such places of the cluster fly and a few other species, which may be easily mistaken for the house fly, is responsible for the prevailing belief as to the way the house fly overwinters. There is therefore no reliable evidence whatever that adult house flies emerging during October and November pass the winter and are able to desposit their eggs the following spring, although they may continue active in heated buildings until nearly the end of January.

On the other hand, there is evidence that house flies pass the winter as larvae and pupae, and that they sometimes breed continuously throughout the winter. In experiments at both Dallas, Tex., and Bethesda, Md., house flies have been found emerging during April from heavily infested manure heaps which had been set out and covered with cages during the preceding autumn. In the Southern states, during warm periods in mid-winter, house flies may emerge and become somewhat troublesome; they frequently lay eggs on warm days.

The second way in which the house fly may pass the winter is by continuous breeding. House flies congregate in heated rooms with the approach of the winter season. If no food or breeding materials are present they eventually die. However, where they have access to both food and suitable substances for egg laying they will continue breeding just as they do outdoors during the summer. Even in very cold climates there are undoubtedly many places, especially in cities, where house flies would have opportunity to pass the winter in this manner.—U. S. Department of Agriculture, Farmers' Bulletin 1408.

Our Fall and Winter Dressmaking Book Contains

page after page of attractive dresses that can be made easily and inexpensively.

besides the many dresses and house garments, our book contains a good choice of costume slips, step-ins, bathrobes, bloomers, nightgowns — pretty, intimate things, which you will find pleasure in making.

and a large variety of garments for house wear to choose from; aprons and morning dresses as pretty as they are practical, and no trouble at all to make;

and everything for the children! Tiny garments for the new arrival, undergarments, play clothes, school togs for the older boy and girl. And jaunty styles for the debutante.

Besides the styles mentioned above, our Fall and Winter Fashion Magazine shows blouses, coats, embroidery designs, Xmas gifts which can easily be made at home, and there are dressmaking lessons showing in great detail how to make several of the styles which would give the beginner a good start. Of course, patterns are obtainable for everything that is shown. It is nice to have a book like this at home because it gives you a large variety of things to choose from. It is worth many times the price asked for it, so we suggest that you send for your copy without delay. Just enclose 10 cents in stamps or coin and ask for a copy of our Fall and Winter Fashion Magazine, addressing your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis.

Friendly Talks for Farm Folks

If, by going without eating, buying a few clothes second-hand or on the installment plan and paying the rent only at the point of being thrown out, an average city worker can save up enough money to keep his car in gas and to equip it with balloon tires and an automatic windshield wiper, he calls it a good year with nothing to complain of much.

The farmer who is raising the staff of life this year has grounds for hopes that it will hold him up for a season instead of letting him down with a sickening thud.

In the write-ups of governors which the Woman's Home Companion is presenting, at least three are mentioned as being lovers of the Holstein or Jersey cow above all other hobbies or pursuits. We suggest, therefore, to gubernational candidates for office that they be photographed hereafter with a calf or cow of black and white, red or fawn persuasion and all will be well. As a vote getter milk would seem to be far ahead of barks or neighs, in our opinion.

There are far too many farmers taking summer boarders again this summer—of the bovine sort.

Grandma Watkins is going to have her hair bobbed at the age of ninty-six. Like a man, a woman is as old as she feels, which is surely her privilege.

The other day over in our neck of the woods, Jake Bigler, an earnest non-pooler, was called to account and fined for watering his milk in the good old-fashioned manner. Seems like these money-making, non-milk-joiners just can't get enough of the League's dollar.

Miss Lucille Hopkins is complaining around that when she went into Tom Newton's barber shop to get her neck shaved, Tom from long force of habit, began shaving her face after finishing up her neck. Does seem as if the ladies ran an awful risk in the once masculine bay rum emporiums.

This is to be an attempt to say a good word for that little-touted by-product of milk—straight cream. You see and hear a lot about milk, about butter, about cheese; but rarely do you see plain cream press-agented or unduly advertised. Yet cream is the frosting of the cake, as it were, and if milk does not contain just so much butterfat, not to mention butter and "cream" cheese, we raise an awful rumpus and declare one and all unfit to eat. It has actually got so that when a person thinks of cream, the vision in his mind at once declares for ice cream or Williams' Shaving. Yet everyone in his right mind knows that there is nothing better on earth to eat than a fresh whipped cream cake, or thick yellow stuff on the cereal and in the coffee. No doubt cream is perfectly able to speak for itself any day, but nevertheless we are of the humble opinion that if it were advertised as persistently and skillfully and scientifically as are the other milk products, the consumption would at once almost double, perhaps treble, as it is no trouble whatever to eat cream on anything eatable. If this belated word for the star of our milk firmanent should be heeded, this lengthy paragraph would not have been indited in vain!

New York. HELEN S. K. WILLCOX.

Stop Rust

Every rod of "Galvannealed" Square Deal fence is made of copper-bearing steel. The patented "Galvannealed" process welds 2 to 3 times more zinc coating into the wire. Copper mixed in with the steel together with the extra heavy zinc coating stops rust; therefore Square Deal lasts 2 to 3 times longer. Costs not one cent more than the ordinary kind. We'll send upon request, copy of official tests that absolutely prove these claims.

Galvannealed Square Deal Fence

has these other good points: Stiff, picket-like stay wires require fewer posts—always tight and trim, no sagging; full gauge wires last longer; famous Square Deal Knot guaranteed not to slip; well crimped line wires give live tension, secure against strains and sudden weather changes.

Two to three times more zinc —more wear—no extra price

Write today for official proof of tests, also get our catalog—and—a copy of Ropp's Calculator (answers 75,000 farm questions). All 3 free. Address

Keystone Steel & Wire Co.
1747 Industrial St. Peoria, Illinois

Notice

"Galvannealed" Square Deal is now marked with a Red Strand. Buy this longer-lasting fence—no extra price.

Always look for the Red Strand (top wire)

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

DAIRY MARKET NEWS

FOND DU LAC, Wis., Sept. 19—Average cheese prices (majority of sales), f. o. b. shipping point: Single Daisies, 20¾c; Longhorns, 21¾c; square prints, 23c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Sept. 20: Single Daisies, 19½c. On Farmers' Call Board, Sept. 19: Longhorns, 21⅝c; square prints, 21¾c.

CHICAGO, Sept. 22—The butter market today was weak, unsettled, and in the buyers' favor. Supplies quite liberal and freely offered with concessions available in some quarters on the medium and lower grades. Buyers showed no interest beyond immediate bare necessities and trade was dull. The centralized cars shared in the weakness and operators found it much easier to buy cars than sell them at prices listed. Buyers expressed no confidence and practically no business was reported.

Fresh butter—91-score, 36½c; 90-score, 34½c; 89-score, 33c; 88-score, 32c; 87-score, 31½c; 86-score, 31c. Centralized carlots—90-score, 34c; 89-score, 33c; 88-score, 31½c.

MILWAUKEE, Sept. 22—Butter—Creamery, extra tubs, 36c; standards, 35½c; extra firsts, tubs, 34@34½c; firsts, 32@33c; seconds, 30@31c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 37½@38c; ordinary firsts (standard cases, 36@36½c; miscellaneous lots, shippers' cases returned, candled, 33@34c; seconds, dirties, 23@24c; checks, 22@23c.

Cheese—American full cream, Twins, 20@20½c; Young Americas, 20½@21c; Longhorns, 20½@21c; Daisies, single, 20@20½c; squares, 22@22½c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

NEW YORK, Sept. 22—Butter—Steady, receipts, 8,364. Creamery, higher than extras, 38@38½c; creamery extras (92-score), 37½c; creamery firsts (88- to 91-score), 34¾@37c; packing stock, current make, No. 2, 27½c.

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firm and active during the week ending Sept. 13th. Considerable buying at primary markets by southern trade. Price advances occurred late in the week under the influence of the active demand. Total U. S. holdings of cheese on September 1 as shown by report released during the week were 76,431,000 lbs. as compared with 63,960,000 lbs. on September 1, 1923, and a five-year average of 60,251,000 lbs.

The average wholesale prices on American cheese, style Twins, for the week ending Sept. 13, 1924, for the corresponding week a year ago and for the previous week were as follows:

	Ave. for the week ending Sept. 13 1924	Sept. 6 1924	Sept. 13 1923
	Cts.	Cts.	Cts.
New York	21.1	20.7	26.0
Chicago	19.6	19.1	23.8
Boston	21.3	21.2	27.0
San Francisco	18.7	18.9	26.3
Wisconsin Boards	19.5	18.8	24.0

The receipts of cheese at these markets were 3,857,465 lbs. for the week as compared with 4,318,540 lbs. last week and 4,472,446 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were irregular and unsettled during the week ending September 13. Sentiment mixed but mostly inclined toward lower prices although scarcity of fancy butter continued to be a supporting factor. Storage report released during week showed holdings on September 1 of 156,232,000 lbs., a surplus of 53,501,000 lbs. over last year. Outcome of this situation is of growing concern. Foreign situation permitted of further exports although quantities limited.

The average wholesale prices on 92-score butter for the week ending Sept. 13, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Sept. 13 1924	Sept. 6 1924	Sept. 13 1923
	Cts.	Cts.	Cts.
New York	38.4	38.1	46.2
Chicago	37.2	37.1	46.6
Philadelphia	39.4	39.2	47.2
Boston	38.7	38.8	46.5
San Francisco	39.6	40.1	48.0

The receipts of butter at these markets were 13,417,833 lbs. for the week as compared with 13,813,177 lbs. for last week and 13,339,258 lbs. a year ago.

September Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 119 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributor's plant.

Table I. September Producers' Prices by Geographic Sections

Section	Range of prices Per cwt.	Comparison of average prices 1924 Sept.	1924 Aug.	1923 Sept.
New England	$2.80—3.87	$3.41	$2.98	$3.44

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on September 1, figures being given in thousands of pounds (000 omitted):

	Sept. 1 5-yr.-ave.	Sept. 1 1923	Sept. 1 1924
Butter, creamery	110,802	102,731	156,232
Cheese, American	60,251	63,960	76 431
Cheese, Swiss	3,900	4,718	7,393
Cheese, Brick	1,819	3,235	1,881
Cheese, Limburger	1,230	1,531	1,345
Cheese, All Other	9,458	7,219	8,370

These holdings include stocks in both cold storage warehouses and packing house plants.

Noted Cow to Attend National Dairy Exposition

At the request of many breeders, the Carnation Milk Farm has decided to exhibit Segis Pietertje Prospect at the National Dairy Show which will be held in Milwaukee September 27 to October 4. It should be remembered that Segis Pietertje Prospect is the champion milk cow of the world. She produced in one year 37,381.4 lbs. milk containing 1,158.95 pounds fat. Few people fully appreciate the enormous amount of work a cow must do in order to produce better than 18½ tons of milk in a year. It staggers the imagination to conceive of the quantity of feed a cow must consume in order to manufacture that quantity of the most refined human food produced. It has taken wonderful skill to breed such an animal and wonderful skill to feed and care for her that she may produce such a wonderful record.

Give the other fellow a chance to talk; he will appreciate the courtesy and you may learn something.

Portland Cement

If you ask a dozen of your neighbors the question, "What is portland cement?", the chances are that you will get about a dozen different answers. Probably each of them will say that it is building material he has used in making concrete improvements about the farm, but very few of them will be able to tell you how it is made or why it is called "portland".

Some people still have the mistaken idea that all "portland" cement comes from Portland, Oregon, or Portland, Maine. Others think it is merely pulverized rock. Yet there is no secret about the manufacture of the material which was invented one hundred years ago by an English brick mason.

This Englishman gave this new material the name "portland" because of its resemblance, when hardened, to a building stone quarried on the Isle of Portland, on the coast of England. The name has stuck ever since, although the original material has been greatly improved and manufacturing methods have been revolutionized during the last fifty years.

Portland cement, therefore, is the general name of a commodity, just like "Iris potatoes or "sterling" silver. In country alone, it is now made by over 5 companies, each with its individual brand. Mixed with sand, pebbles, and water, it forms concrete.

The essential elements of portland cement are lime, silica, and alumina. These ingredients are secured from different combinations of materials such as limestone, clay, shale, marl, and blast furnace slag. From quarry or pit these materials are transported to the mill where they are reduced to fine powder with much heavy grinding machinery. In the process they must be correctly proportioned and thoroughly mixed so that the mixture is chemically exact.

The finely powdered raw material then goes to the kilns for burning. These kilns are huge steel cylinders lined with firebrick. The powder is burned at a temperature of between 2500 and 3000 degrees Fahrenheit, or a heat greater than is necessary to melt steel. Chemical reactions take place in this burning that give the resulting product its cementing qualities.

Coming from the kilns in the shape of white hot-clinker, consisting of glass-hard balls ranging in size from a small marble to a walnut, this material is sent to coolers and on to storage piles. Later it is ground with a small amount of gypsum, added to regulate the rate of hardening. In this final grinding the hard clinker is reduced to a powder finer than flour. Standard specifications demand that it be fine enough for at least 78 per cent of a given quantity to shake through a sieve having 40,000 holes to a square inch—a sieve that is finer than silk.

In this fine powder you have finished cement.

There is no guesswork about the quality of portland cement. Regardless of the method of manufacture or the brand name, before it is marketed it must meet the standard requirements set up by the United States Government and the American Society for Testing Materials. The farmer buying portland cement for a silo, feeding floor, or sanitary dairy barn knows that the cement he gets is just the same quality as that used for city skyscrapers, railroad bridges, or permanent concrete highways.

Approximately one-fifth of the 137,000,000 barrels of portland cement manufactured in this country last year was used for permanent improvements on American farms.—Portland Cement Association.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Lesson On Corn Varieties

Foreword: Here is the third installment in the "Adventures of Daniel Dare". This week Danny stars in the agricultural class at school. The subject under discussion just now concerns the varieties of corn. By his brilliant performance Dan wins the admiration of Mary, a sweet little girl who sits just across the aisle, and also makes a hit with his teacher. You'll like Danny Dare. Watch for the next chapter.

"Class in agriculture please come forward."

In response to this call from Miss Edsel a half dozen boys and girls arose from their seats and went to the front seat, among them our little hero, Daniel Dare.

"What's the lesson about today, John?"

"Somep'n 'bout v'rieties of corn, I guess. Least that's what I studied." The girls giggled.

"John, can you tell us how many races of corn there are?"

"Well, there's yellow, and white, and blue, and red corn."

"I think there are something over three hundred, Miss Edsel."

"Right you are. Can you name a few of the more popular varieties in this corn zone?"

"Well, of the yellow, Murdock, Wisconsin number 12, and Reid's Yellow Dent are favorites. In the white varieties there are Boone County White, Johnson County White, Wisconsin Number 7 or Silver King, and Iowa Silver Mine."

"Who can name two varieties of flint? Margaret, can you?"

"Smut Nose and King Phillips."

"Now for the pop and the sweet corn—Mary, how about it?"

"Baby Rice is one variety of pop corn, and Evergreen is a sweet corn. And I can't think of any more just now."

Danny's hand was waving frantically and he was snapping his fingers. Miss Edsel couldn't resist the eagerness of the boy. "Well Danny?"

"I know some more. There are two kinds of pop corn, pearl and rice.

The correct identification of the above corn varieties as given by Danny Dare, reading from left to right, in back row is Johnson County White, Reid Yellow Dent, Calico or Blue Mexican sweet, late blue sweet, late sweet. Front row, left to right, Baby Golden popcorn, white flour (sweet) corn, Early Evergreen (sweet), White Rice, popcorn, Red Rice popcorn, and Japanese Hulless popcorn.

"Yes, that's true. But that doesn't exactly answer my question. Danny, What can you tell us about the races of corn?"

Danny stood up. "There are six, Miss Edsel—dent, flint, sweet, and pop corn are the four most commonly used. Soft and pod are two other races."

"Which race is grown most extensively?"

"Nine-tenths of all the corn grown in America is dent," promptly answered Danny. "It says in the book that for every barrel of pop corn grown there are raised two barrels of sweet corn, seven barrels of flint and ninety barrels of dent. Dent and flint corn are used chiefly for feeding stock. Sweet and popcorn are raised largely for human consumption."

"Why do they raise any flint if dent is so popular?" Miss Edsel shot back at Danny.

"Flint corn is better suited to cool climates. It is also a good forage crop because it produces many suckers and its leaves and stalks are not so woody as those of dent. Because of the hardness of its kernels flint is excellent for long sea shipments. Once the kernels dry out they do not readily take up enough moisture to spoil. The hardness keeps insects from injuring the kernels."

"Most excellent, Danny. Now we'll see if some of the others can recite as well. Jimmie—how many varieties of dent corn are there?"

White Pearl and Queen Golden are popular pearl varieties. In the rice there are besides Baby Rice, Baby Golden, Red Rice, and Japanese Hulless. The kernels of the rice variety have sharp pointed tips while the pearl kernels are round at the top. There is also Golden Bantam sweet, and Blue Mexican sweet corn."

"Now Danny, I have a test for you. You seem to know varieties pretty well. Could you pick them out if you should see them? In back of my desk I have a number of samples of several varieties. Let's see if you know what they are?" Miss Edsel went in back of her desk and lifted the tray of samples onto the desk. True to his name, Danny *dared* to go up and point out to the class the different varieties shown.

"I want to tell you something about pop corn before you go back to your seats," said Miss Edsel when Danny had finished successfully his demonstration in front of the class on corn varieties.

"Have you wondered what makes pop corn pop? Here is an explanation that may interest you. Inside the kernel moisture is locked up by the hard outside covering of the kernel. When you heat the kernel the moisture is changed into steam. Suddenly the steam bursts the kernel and turns the starch inside out, making the kernel about twenty times its natural size.

"Now pass quietly back to your seats and for the next time study about the many uses of corn."

With the Badger Juniors

"Hey, cut it out! Who threw that shoe?"

Laughter broke out among a certain group in the big tent. Over in another corner came a different sound—a falling bed taking a surprised youth down with it. More laughs.

CAMP CONDUCTOR "MAC" McNEEL

"Lights out, fellows. Let's have it quiet," boomed the voice of the tent leader. Darkness descended on the mischievous and laughing boys. The lights outside on the fair grounds shone on the walls and made a very faint glow within. In a few minutes all was varvelously quiet, considering the noise that had preceded. An occasional roar from the roller coaster a few rods away smote the silence as lingering fair visitors took a farewell thrill. But little did it bother the youths, for they were tired from their day's activities and sleep came without calling.

"Good morning, Archie. You're lookin' pretty!" The youth addressed grunted, sat up half way in bed, then flopped down again. His bunkie poked him in the ribs and the jig was up. Somebody threw a blanket and made the mess worse. Finally Archie emerged victorious and perched himself astride his tormentor.

All around there was activity in the boys' tent. Although only shortly after six, the beds were beginning to look quite empty. Sunlight was streaming in through the raised sides of the tent. Another day was begun at the 4-H club camp, Wisconsin State Fair.

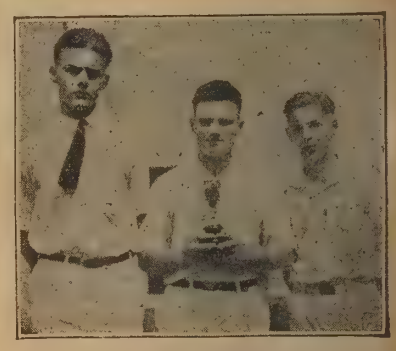
Mealtime was always a happy time. The eats were of the best, thanks to Mrs. G. Mason and Mr. and Mrs. E. Hausen, camp cooks. Boys and girls ate together in a big tent situated between the boys' sleeping quarters and the girls' tent. After

MARATHON COUNTY DAIRY DISHES DEMONSTRATION TEAM

Left to right: Vangel Russell (coach), Ragnhild Anderson, Ruby Maas (Captain), Veronica Schilling.

the food came the surprises. Camp Conductor Wakelin McNeel kept things going at a rapid pace, and if anyone ever escaped public speaking before, he had no chance to escape at meal time in the camp.

Four hundred and sixty young people camped at the Wisconsin State Fair. This was the biggest boys' and girls' camp held in the history of the fair. Its size did not detract from its splendid spirit in the least. There are few similar camps where the spirit of brotherly love is any stronger.



Besides the good times in camp, there was work to be done. Some 45 demonstration teams from all over the state competed for honors. There was a tremendous showing of dairy calves, some 250 head. Pigs, sheep, and poultry were also on parade. Live stock exhibits were housed separately, but the whole interior of the grandstand was given over this year to the work of the boys' and girls' clubs. Here demonstration teams "did their stuff". Here the girls exhibited the products of their labor—canning, and sewing, and garden club produce. Here also the Smith—Hughes high school agricultural students had a fine series of booths telling the story of the hen.

EVELYN HARDENBROOK CHAMPION HEALTH GIRL

The best dairy calf demonstration team was that which represented Milwaukee County—Harry Barstow, captain, Arnold J. Ullstrup and Billy Rolfs. They were coached by E. C. Thompson, county agent and club leader. Harry Barstow was elected champion demonstrator at the fair.

Another dairy demonstration team that won honors was the one from

WISCONSIN'S CHAMPION DAIRY CALF DEMONSTRATION TEAM

Left to right: Arnold J. Ullstrup, Harry Barstow (captain and champion demonstrator) and Billy Rolfs. This team was coached by E. C. Thompson.

Marathon County coached by Miss Vangel Russell, home demonstration agent, on the subject of Dairy Dishes. The team was captained by Ruby Maas with Veronica Schilling and Ragnhild Anderson as mates. E. M. Tiffany, University of Wisconsin, judged the boys' demonstration work and Mrs. Baker, Minnesota, the girls'.

One of the features of the camp was stunt night. The champion stunt was performed by Chief Cook Ernest Hausen, world's record holder for speed in picking poultry. Timed by a race track official, Mr. Hausen broke his own world's record of five seconds flat for picking one bird and did the job in four and three-fourths seconds.

Here are the winners in the dairy calf club exhibits. Leslie Woodruff won the showmen's contest:

Holsteins

Junior heifers—(1) Edw. Fisher; (2) Clarence Halle (3) Alfred Gempler. Senior heifer calves—(1) Delmont Lohnis; (2) Byron Kamrath; (3) Russell Stevens. Bull calves (1) Clarence Halle; (2) Linda Stolper; (3) Erna Stolper. Yearling heifers—(1) Olger Mickelson; (2) Irene Davis; (3) Bryce Humphrey.

CHAMPION POULTRY JUDGE, ALVIN SCHUTT

Guernseys

Junior heifer calves—(1) Walter Entress; (2) Theodore Anderson; (3) Kenneth Woodward. Senior heifer calves—(1)

Frank Fox, Jr. (2) Freddie Fisher; (3) Emil Molpas. Bull calves—(1) Wilbur Reed; (2) Frank Fox, Jr.; (3) Tom Ryan. Yearling heifers—(1) Cyril Smithmeyer; (2) Alvin Rylea; (3) Helen Kersten.

Jerseys

Junior heifer calves—(1) Max Wallace; (2) Stanley Sullivan; (3) Clois Dickan. Senior heifer calves—(1) Adolph Mistele; (2) George Mason; (3) Lawrence Frye. Bull calves—(1) Lenora Wyatt; (2) Vernon Knudson (3) Horace Wyatt. Yearling heifers—(1) Adolph Mistele; (2) Lawrence Frye; (3) Vernon Knudson.

Ayrshires

Junior and senior heifer calves—(1) Glen Nelson; (2) Dan Hanrahan; (3) William Walvoord. Bull calves—(1) Wm. Walvoord; (2) Norman Muska.

Brown Swiss

Junior and senior heifer calves—(1) Lila Schmid; (2) Victor Capaul; (3) Lester Kuehl. Bull calves—Lila Schmid. Yearling heifers—James Hensell.

Upper Michigan Camp

Three hundred seventy-three campers made the fifth annual encampment of Upper Peninsula boys' and girls' agricultural clubs the largest ever held in Michigan, according to A. G. Kettunen, assistant state club leader.

Rain and threatening skies tried to mar the occasion but were unsuccessful. The campers did make mighty good use of the new dining hall, a splendid waterproof structure in use for the first time.

Regular courses of instruction were given the boys by experts in the following subjects: judging, feeding, and caring of dairy cattle; crops, sheep, and hogs, poultry and farm mechanics, potato culture and athletics. The girls were taught nutrition, sewing, personal hygiene, and home nursing, art, music, canning, clothing, and athletics.

First place in the dairy judging contest went to the Chippewa County team composed of William Follis, Evelyn Armstrong, and Egbert Talsma. The Marquette County team won first in the dairy fitting contest. Members of this team were Clyde Berquist and Albert Johnson. Grant Gallup and Warren Brittan of Iron County won the poultry contest.

William Follis won a pure-bred Holstein heifer presented by the Loeb Farms, Michigan, to the best dairy judge in the eastern half of the peninsula, and Raymond Labyak won a similar prize from the Upper Peninsula Experiment Station for excelling as a dairy judge in the western half.

The Upper Peninsula Experiment Station also presented Leroy Oberg with a pure-bred Duroc Jersey hog for his proficiency in judging hogs, and to Hubert Greenlund a pure-bred Shropshire lamb for being the best judge of sheep.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Agricultural fairs and expositions have done much to build up the farming industry. At the present time Hoard's Dairyman is carrying a number of state fair reports which our junior readers should become familiar with. How many of you can tell which was the first state fair held west of the Alleghanies? Can you name the show ring champions in the various dairy breeds at the several fairs reported in the Dairyman? Besides fair reports, you will find several articles worth your attention in the September 19th issue of Hoard's Dairyman. For further discussion of the following paragraphs refer to this issue.

Why should a country boy be contented? Charles B. Wing, an Ohio farmer, says, "What does life give to man? Food and drink, warmth, and rest; food for body, mind, and soul, warmth from the sun and fuel that we burn, and rest for body and mind. We who live in the country are especially favored along these lines and we ought to be fairly contented."

How much can the average farmer specialize in dairying and make it pay? The Department of Economics at the Ontario Agricultural College in making a survey in one of the dairy countries found that the safest and best organization for the average man is to specialize in dairying between 61 and 70 per cent. (See article "Specialization—Does it Pay"?)

How do Danish farmers thresh? On small farms threshing is done by hand with a flail. On the medium sized farm it is done with a small horse-power threshing machine that will take a small handful at a time and thresh the kernels from the grain.

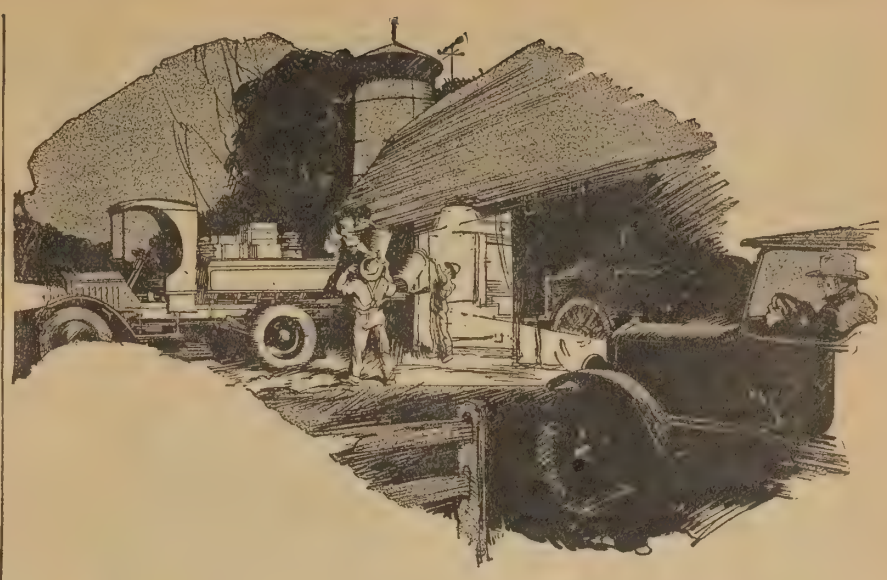
When did Danish co-operation begin? Danish farmers turned to the dairy cow to save them from low grain prices which had heretofore been the principal crop of their farms. More cows gave the idea of co-operative creameries. From this small beginning, co-operation grew to an enormous movement.

How much land is untillable? Mr. Fraser tells us in his twelfth article on Sweet Clover Pasture that one-sixth of the farm land in the nine chief dairy states is untillable.

What can we do with this land to increase its production? At least three-fourths of the blue grass pasture on our millions and millions of acres of untillable land could be reinforced with sweet clover by discing the seed into it.

What kind of seed should be sown? In order to have a continuous supply of sweet clover pasture you must have both first and second year plants every year. For this reason it is best to sow a double amount of unscarified seed, part of which will not germinate until the second year.

Prizes for Boys and Girls



A gold watch, a silver and three bronze medals will be the capital prizes offered the five best judges among the boys' and girls' calf club entries at the National Dairy Show at Milwaukee, Sept. 27 to Oct. 4. In addition, twenty gold, silver, and bronze fobs will be awarded in the four breed classes to winners. Team prizes to the number of five, consisting of fobs, will also be awarded. The Holstein-Friesian Association has voted $250 for prizes, in addition to two silver cups and a team fob prize. The winner of the grand champion Guernsey calf will be given a placque by the American Guernsey Cattle Club. The Brown Swiss Breeders' Association is offering $100 in prizes. The club program opens on Monday, Sept. 29, with cattle judging. The demonstration team contests start Tuesday, club frolic Thursday, and calf judging Friday. Tours through the dairy region for the club members have been planned.

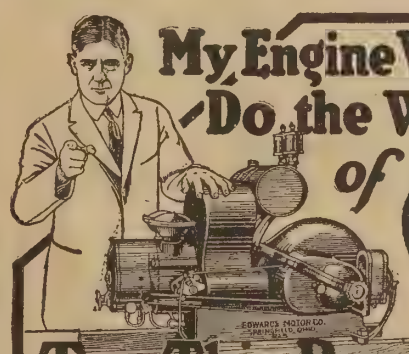
How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Lamps make the automobile a 24-hour utility



Because it is equipped with electric headlights the automobile is ready for service at any hour of the night—a dependable means of swift travel, for business, for recreation, or for the midnight emergency.

On 3,000,000 American farms the electrically-lighted automobile is a modern necessity that makes for better and happier living.

The General Electric Company makes lamps for every use, from giant ocean beacons to pocket flashlights. Every one carries the G-E monogram, a mark of scientific achievement and useful public service.

The new G-E Farm Book, giving interesting facts on the subject of farm electrification, will be sent on request. Write Section E, General Electric Company, Schenectady, N.Y.; Chicago, Ill., or San Francisco, Cal.

GENERAL ELECTRIC

My Engine Will Do the Work of 6

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."
—A. Y. EDWARDS

EDWARDS FARM ENGINE

Try This Remarkable Engine FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1½ to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1½ H. P. when you need only 1½, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hannibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect running balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulan Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch grinder, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer, threshing machine, etc. Do work for my neighbors. Easy to move around and easy to run. I would not have any other."

Free Trial Offer

Now—I want to prove my claims to you. I want to send you an Edwards Engine for absolutely free trial. Just write your name and address on coupon and mail. I will send at once complete details about my farm engine and about my free trial offer. No cost or obligation. Mail coupon now.

A Gold Medal and Porkers

The first litter of pigs of the 200 or more enrolled in the Keystone Ton Litter Club went over the top in Snyder County, Penn., recently with a weight of 2,106 pounds in the 180 allotted days.

In addition to the honor of owning the first ton litter in Pennsylvania and possibly in the United States in 1924, Elias Ritter, the grower who produced the pigs, can claim the distinction of being one of five men in the United States that ever produced a ton litter that consisted of only eight pigs. Only four times in the history of the ton litter project which has been carried on in the corn belt states for several years has such a feat been accomplished.

The eight "porkers" that have brought this unusual distinction to the Keystone State and to Snyder County are Chester Whites from a pure-bred boar and grade sow. How carefully Mr. Ritter cared for his pigs is shown by the fact that he raised every one of the original litter of eight. A gold medal is to be awarded every man in Pennsylvania who succeeds in producing a ton litter and Ritter's name heads the list.

C. D. BYRNE.
Penn. College of Agriculture

A Washington Champion

Washington's new Holstein champion is Florence Pontiac of Greenbank that now holds the state's highest record for butter production in ten months as a full age cow, according to the Advanced Registry Department of the Holstein-Friesian Association of America. In the herd of the Western State Hospital this cow produced 24,047.7 pounds milk containing 779.09 pounds butterfat, equivalent to 973.8 pounds butter.—Extension Service Holstein-Friesian Ass'n. of America.

"Gee, Mazie, I wisht some one would start a campaign fer savin' darkness instead uv daylight."

A REPLY TO SCHILLING

On Organizing Producers

G. R. RICE, Sec'y Milwaukee Co-operative Milk Producers

THE article, "Organizing New England Dairy Farmers", by W. F. Schilling, attracts attention. President Schilling is a capable writer and an able expounder of the plan of marketing milk as practiced by the Twin City Milk Producers' Association, but his conclusions tend to mislead the fluid market milk producer. Mr. Schilling recites at some length the experiences and practices of his association which are rather interesting, but he also makes some very positive statements of alleged facts which we feel impelled to question.

The two principal types of fluid milk selling organizations are named by him and placed: "The centrally controlled has everything in its favor", and "We were confronted at the outset by the fact that a bargaining organization was a fizzle". It is probably safe to assume that the intended purpose and object of any of our milk selling organizations is service to the industry and betterment of the producer's condition, shall I say dealers, also?

Mr. Schilling speaks of the Twin City Milk Producers' Association as "the *oldest* and *most* successful milk marketing organization in America". "It will be eight years old next September." The Milwaukee Co-operative Milk Producers was eight years old the 16th of last April, and it has functioned continuously since that date.

The net return to the members of these associations for their milk may be taken as an indication of the success of the respective organizations and also perhaps measures the value of the two types mentioned. The Twin City Association represents, according to Mr. Schilling, the superlative in "centrally controlled". The Milwaukee Association may be considered representative of the "bargaining organization" type.

The average net return per cwt. of 3.5% milk at the farm to the association member for the years 1921, 1922, and 1923 was: Twin City Association, $1.95; Milwaukee Association, $2.07. The average difference for the three years is 12 cts. per cwt. in favor of the "bargaining organization", located in the heaviest fluid milk producing section of the whole country and selling to a smaller consuming center than the Twin City Association. The 12c per cwt. difference means $1000 per day on the Twin City Association intake of twenty-five million pounds per month, or $30,000 per month.

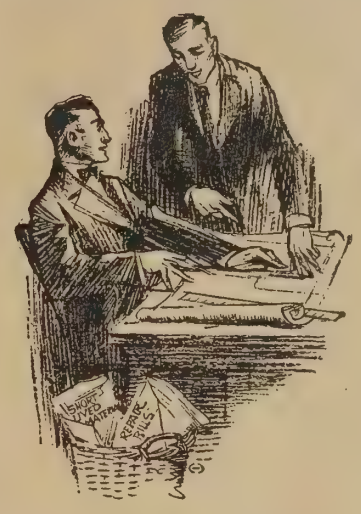
Is our "bargaining organization" such a "fizzle"? Is the "centrally controlled" so "sucessful"? The ability to sell any commodity successfully is somewhat of an art in this present day, and especially is it true of milk in fluid form at any advance over manufactured value. It takes only a comparatively small area to supply a large consuming center like Minneapolis and St. Paul with its needs for fluid milk. The section adjoining the zone of needed fluid supply is constantly attempting to "break in" on the fluid market if the price paid is above manufactured value plus the extra cost of delivery. There is only one way to sell successfully, and that is to influence the buyer to buy and pay the price. This may be done in several ways.

One is to apply a padded brick with just the right amount of force to the correct spot above the neck, which will make the buyer amenable to the seller's reasoning. Another is to "corner" the supply so the buyer is compelled to buy from you if he wishes to buy at all. Another is to gain the buyer's good will, his confidence, and his co-operation to such an extent that he will buy his needed supply from you even at a higher price than it might be bought elsewhere.

The first method is not practiced as much by sellers today as it was formerly. The second method has been or is being followed by a considerable number today with rather indifferent success in the selling of fluid milk. Various existing milk producers' associations are obliged to extend their area of supply beyond their need, in their attempt to bring about "monopoly control" of the fluid milk, and "contracts" are still being signed with those outside the needed circle in order to keep them from "breaking" the market with their production.

The third method is followed by a few associations with the result that the buyers of milk do what you and I as individuals are doing constantly; that is, buying from those that have our confidence and good will, even though we pay more sometimes, or all the time, than we might some place else. But does someone say, "That is not true; we buy from the first store we come to"? No, we do not. We pass up Smith's to reach Brown's store, be it shoes, clothes, groceries, machinery, or what not that we need, because of the confidences we have in Brown—because of good will we have the desire to throw everything we can Brown's way. Is good will a business asset? Yes, it is. Can it be capitalized? Does it yield a financial return? You know it! Why do so many fluid milk association salesmen wish to "centrally control"? Are "the open price associations" so "harmless and toothless" when it comes to getting results? What are we organized for? Is it to "harm" someone, is it "control" and selfish power, or is it service to the industry and betterment of conditions?

Mr. Schilling says, "I would not be afraid of the milk dealers", which proves that he is afraid of them and always will be until he grows big enough to think of the milk industry as the unit. Dealers and producers are each a part of the same thing, and should co-operate for the benefit of the industry. They do so work together in some places that we know of, and would without doubt in other places if the good of the industry were uppermost in the minds of all. If the dealer and the producer will think of the good of the industry rather than their own individual good, they will grow together, think together, work together as one. There is, then, no question *between them* to argue over, and "fight" about. The disposition to "harm" either side will be absent.



Mr. Schilling to bolster up his courage repeats aloud, "I would not be afraid". His fear engenders fear in the other, so both are afraid, and both do things to protect themselves from detrimental practices, instead of working together for the common good. The dangerous body is the "afraid" person; one never knows when his finger is going to jerk the trigger.

Confidence in each other creates stability. Good will brings the price. Co-operation gives protection to the industry in our individual markets. The three combined promote harmony and the team work that renders efficient service to the industry and betterment of conditions for all, producers and dealers alike.

Be patient—you probably get on somebody's nerves yourself.

Tide Water Cypress "The Wood Eternal"

"WE'LL CUT OUT THE 'REPAIRS' ITEM at the start, so you can milk your cows without *replacement* costs milking you."

"He who looks before he leaps
Builds of Cypress and builds for keeps.

"Cypress for every outdoor use
Scorns Weather's wear and Time's abuse.

"It doesn't rot, nor twist, nor swell;
It lasts, and LASTS, and LASTS—so well."

The architect is right. And when he says "Build of 'Tidewater' Cypress, "The Wood Eternal," he is *very* right. And if he *don't* say "Cypress", it's up to *you* to say it. But undoubtedly he will. (He wants his work to *last*.)

"Build once and build for keeps." Money saved on repairs is all profit.

DROP A CARD for Full Size Working Plans for 3 barns, a poultry house, a hog-house, a double corn-crib, a SILO and a greenhouse—absolutely FREE. These come with the 72-page "VOL. 20" of the Cypress Pocket Library—yours *free* on request by return mail.

(*This book is said to be well worth filing—by ANYBODY.*)

En-ar-co MOTOR OIL

THE OIL OF A MILLION TESTS

IN making En-ar-co Oils we average over a million tests a year. These tests are of every kind and cover every step of our Scientific Refining process.

Some of these tests are so accurate that they are timed with a stop watch, and their accuracy is a matter of split seconds.

That is why En-ar-co Motor Oil is endorsed by all of the leading motor builders and is considered everywhere the best to be had.

Try it in your motor! Drain out the old oil, put in fresh En-ar-co and you will at once notice a difference. You will have less trouble and less repair cost.

Association Notes by Testers

Culver, Ind.: The 361 cows tested in August averaged 746 lbs. milk, 28.7 lbs. fat; profit, $12.62. J. D. Newman's herd qualified for the bronze medal given by the state dairy association when 10 cows in a herd produced in excess of 300 lbs. fat per year. Sweet clover is making excellent pasture crop where it is not allowed too strong a growth before starting to pasture it. Market milk sold for $2.30 a cwt. The cheese factory paid $1.30 a cwt. for milk. Milk retailed for 10—12c a quart, butter for 42c a lb.—W. R. Matthews.

LaGrange Co., Ind.: One member built a silo. The condensery paid $2.00 per cwt. for 4% milk, the creamery 32—45c per lb. for fat.—R. K. Dugdale.

Elkhart Co., Ind.: Last month, of the 309 cows tested, 13 produced over 60 lbs. fat, 22 over 50 lbs., 48 over 40 lbs. and 100 over one pound daily. The high herd of six registered Holsteins owned by Arthur Landis produced 46.43 lbs. fat. One new dairy building is being constructed. Market milk sold for $2.25—3.25 per cwt. The condensery paid $2.00 per cwt. for milk.—W. D. Campbell.

McLean Co. D. I., Ill.: The year's report shows that the grade Jersey herd of D. Hastings made a profit of $38.00 more per cow during the year just completed than it did three years ago when he started testing. Milk retailed for 11c per quart.—H. R. Fletcher.

Kane Co. No. 3, Ill.: Four members weigh milk daily. One member remodeled his barn. The high herd owned by J. H. Burr averaged 40.2 lbs. fat. The 512 cows tested averaged 23.4 lbs. fat. Flies and mosquitoes were bad last month, the main reason for the average production being 5 lbs. lower than in July. Market milk sold for $2.50 per cwt.—W. P. Schmit.

Southside, Va.: This has been an adverse season. Very little corn will ripen for grain and silage corn will make about half a crop. The prolonged drouth has made pasture practically worthless, yet the wells have furnished plenty of water. Two silos were built, one wooden and one hollow tile. Production is the lowest for ten months on account of the large number of dry cows and lack of feed. Market milk, grade B, sold for $3.93 per cwt. The cheese factory paid 42c per lb. for fat. The creamery at Danville paid 36c per lb. for fat. Milk retailed for 15c per quart, butter for 40c per lb.—C. A. Buck.

Prince Williams Co., Va.: The corn crop in this section is very poor. Some dairymen will have trouble getting sufficient corn to fill their silos. One member has put in a concrete floor to mix his feed on. One new dairy barn is being rebuilt. This association ended its year's testing the last of August with an annual meeting. The association was reorganized and an annual report made. Three bronze cups were given to its members, one for high herd, won by C. B. Fitzwater, which averaged 9,873 lbs. milk, 384.5 lbs. fat. This cup was donated by merchants of Nokesville and Manassas. The cup given for largest increase over last year's production in fat was won by C. N. Rhodes and was given by the National Bank of Manassas. Mr. Rhodes increased his herd average from 280 lbs. in 1923 to 335 lbs. in 1924. The cup given for highest fat producing cow was won by Clover Hill Farm and donated by Larkin & Dorrell, feed dealers of Manassas. This cow was a pure-bred Jersey and produced 613 lbs. fat. The association average for the year was 277.5 lbs. fat, 7,400 lbs. milk.—T. T. Curtis.

Gray's Harbor, Wash.: Due to dry weather and extremely high price of feed, production has fallen off. One dispersal sale of 90 head of cattle was held the last of the month.—F. R. Haynes.

Tri County, Ohio: Of the 213 cows tested last month, 16 cows produced over 1,000 lbs. milk and eight over 50 lbs. fat. The total average production was 565.5 lbs. milk, 27.2 lbs. fat. The Tri County and Ohio Valley Associations held their annual picnic August 15th. One milking machine was installed and one silo built. The corn crop is very late in this section and in danger of frost. Market milk sold for $2.53 per cwt. and retailed for 15 cents per quart.—E. A. Mizer.

Washington Co., Kans.: One member is remodeling his barn and erecting a silo. Members of this association are planning a stock show to be held at Linn, September 12—13, at which over $400 in prize money will be given away. The co-operative creamery paid 33c per lb. for fat, other stations 26—28c during August.—H. G. Lenhert.

Alpena—Leer, Mich.: There was a decrease in milk production last month. Only five members fed grain with pasture. The association average was 629 lbs. milk, 28.2 lbs. fat. Ten cows produced 50 lbs. fat, 29 over 40 lbs. Market milk sold for $2.50—3.00 per cwt. and retailed for 16c per quart.—C. Jennings.

East Montcalm, Mich.: Two separators were tested. Three members limed ground for alfalfa and sweet clover. About one-half of the members fed grain with pasture. All members but one use pure-bred bulls. Market milk sold for $2.00 per cwt.

The condensery paid $1.75 per cwt. for milk, the cheese factory $1.65. The creamery paid 38c per lb. for fat.—K. L. Orr.

Alpine—West Kent, Mich.: One separator was found to be testing at a loss. Several barns were newly whitewashed. The second crop of alfalfa is harvested in good shape. Three full herds are being shown at state fairs. An association tour on August 28th was attended by several members and the tester. Market milk sold for $2.60 per cwt. The condensery paid $1.75 for 4% milk direct ratio.—P. C. Wittenbach.

Rives-Jackson, Mich.: A new electric milker was installed on one farm. One barn was whitewashed and another is being rebuilt which was recently completely wrecked by a cyclone. Market milk sold for $2.35 per cwt. The condensery paid $1.70 for milk, the cheese factory $1.55. Milk retailed for 12c per quart.—J. Bird.

St. Clair No. 2, Mich.: Most cows are up in production, due to the quality of new seeding pasture. Two silos are under construction and one member has a new milk house and cow stable. All members sell whole milk. Market milk sold for $3.00 per cwt. at Detroit.—J. N. Ingland.

McComb No. 2, Mich.: Two herds were tested for tuberculosis and no reactors found. One member sold his entire herd of 14 grade Holsteins. Market milk sold for $3.00 per cwt. basic, $1.68 for surplus.—C. Blumer.

Mondovi — Gilmanton — Modena, Wis.: Sixty tons of oil meal have been purchased co-operatively and delivered in this association. August has been a good month for pasture in this section and cows are producing well and maintaining a good condition. Two concrete block silos are being built. Two more members had their herds tuberculin tested and no reactors found.—W. E. Acker.

Allenton—Kohlsville, Wis.: This association will send a carload of typy cows and bred heifers that fill all the requirements to the National Dairy Show Grade Cow Sale. The condensery paid $1.88 per cwt. for milk, the cheese factory $1.70. Milk retailed for 8c per quart.—V. M. Anderson.

Elroy, Wis.: Nineteen cows produced over 40 lbs. fat. Three herds averaged over 30 lbs. Four separators were found to be doing poor work.—A. G. Steffen.

Ithaca—Lone Rock, Wis.: One member has rented a limestone crusher and is grinding his own lime for next year's alfalfa. Some members are putting up soy bean hay of a good quality. Butterfat sold for 41¼c at the Richland Center condensery. The condensery skimmed for about a week until their stocks of condensed milk were lowered. Cheese sold for 12½—18c. Sweet cream brings from 40—42½c.—F. A. Dengler.

Footville—Evansville, Wis.: Two barns were whitewashed. A new barn equipment was installed by one member and an electric lighting plant by another. Market milk sold for $2.50 per cwt. The condensery paid $1.60 per cwt. for milk.—A. C. Lasse.

Denmark, Wis.: A few farmers have purchased most of their winter supply of feed. This association sent a judging team to the fair to participate in a judging contest held in this part of the state. They won second place. The condensery paid $1.70 per cwt. for milk. Milk retailed for 7—9c per quart.—M. H. Nelson.

"The secret of health," writes a doctor, "is the eating of Limburger cheese." But the trouble is to keep it a secret.

Ever Failing or Never Failing Pasture

(Continued from page 269)

ness. If a firm making grain binders would start forging each individual part by hand, it could not expect to compete with other companies using modern methods. Likewise, the dairy farmer who depends on bluegrass pasture and has to raise a large amount of hay, silage, and grain to supplement this pasture, and feed each cow by hand during much of the summer six months, has enormously increased his cost of production over that of the dairyman who simply opens the gate to his sweet clover pasture and lets the whole herd both harvest their own feed and feed themselves in the natural way all summer. And every dollar of that difference is added to the latter's profit.

The Revelation In Farm Accounts

In an abundant six months' pasture crop, the farmer has a remarkable lever for reducing the cost of production. Everywhere that farm accounts are kept—and that is now upon hundreds of farms—the fact is coming out that there is a wide range in cost of production, far wider than the whole farm profit, and that in any group the five or ten men having the lowest cost of production have made money even under unfavorable price and crop conditions, while the five or ten having the highest cost of production, not only have no profit whatever, but often come no where near making expenses, laborer's wages for the farmer, and reasonable interest on the investment. With sweet clover pasture the farmer can make successful attack upon his cost of production, and that is the reason for this series of articles.

Is Sequel to The Winter Feeding

In the twenty-acre dairy demonstration conducted by the writer at the University of Illinois for six years, and reported in Hoard's Dairyman nearly two years ago in the series of articles entitled "Most Milk Per Acre on Farm Feeds Alone", the incomparable place of alfalfa hay for winter feeding was brought out. Incomparable in yield per acre, incomparable as a balancing protein feed with corn silage, incomparable to sustain the health and vigor of the cow, incomparable as a roughage in producing milk, and incomparable in economy of cost.

This pasture series is really a sequel to that demonstration of winter feeding or barn feeding. It is on exactly the same idea of farm production of the cheapest and most suitable dairy feeds, only it goes a step further and takes advantage of the summer growing season to get a greater degree of economy in the same kind of feed. Sweet clover is not a rival of alfalfa but her summer sister, and will do exactly the same things as alfalfa—and more, for it takes the place of silage also. It is just as suitable to the cow's health and vigor; it is just as great a feed and stimulant for milk production as alfalfa. It is just as high a yielder; it is just as sure a grower. But in economy of feed cost and especially in the saving of labor, it has considerably the advantage of alfalfa, as we have seen.

So the sweet clover system is not something different, to supersede the corn and alfalfa system, which would not have been complete for the year around feeding without the former. The two are one, each affording the greatest economy and convenience during its particular season.

BALED SHAVINGS

For Bedding Cattle, Horses or Hogs

is the BEST for cleanliness and health, as it keeps the BARN FLOORS in a DRY and SANITARY condition by absorbing all the moisture without much loss in the amount of bedding used under each animal.

Convenient—Sanitary—Serviceable

Also used for ICE HOUSE PACKING, INSULATING BUILDINGS, Etc. Our shavings are put up with 2 and 3 wires. Bales will run 70 to 80 lbs. each, minimum car 15 tons. Railroad weights to govern shipments.

SAWDUST IN CAR-LOTS ONLY. Write for Prices.

A New Jamesway Book Free to Dairymen

It May Save You Many Dollars!

Some of the Things This Book Tells—

- How to get a good dairy barn.
- How to remodel an old barn.
- How to get good ventilation.
- The Essentials of a Good Cow Stall.
- How to Give cows pasture comfort in the barn.
- How to judge a stanchion.
- How to feed cows for profit.
- How to insure "safety first" with the bull.
- How to make the cleaning job easy.
- How to water your cows in the barn.
- How to have better hogs and bigger litters.
- How to make more money from your hens.
- How Jamesway "Pay-from-Earnings" Plan pays for your equipment as you use it.

WE SELL DIRECT TO USER

And many other helpful pointers on cow, sow and hen problems.

If you are interested in bigger earnings from cow, sow and hen, there's a world of information for you in this new Jamesway book.

It's filled with ideas. Tells how Jamesway "Direct-to-Farmer" Service is cutting out needless labor costs and needless hard work in farming, and enabling folks to live better, happier and put away more in profits each year.

Find out **how much Jamesway can increase your earnings?** You can install Jamesway Steel Stalls, Pens, Drinking Cups, Litter Carriers, Poultry House Equipment, etc., at once, on "Pay-from-Increased-Earnings" plan.

Jamesway Service is given personally right on your farm by our local Jamesway man in your territory. Our new book tells about it. Send for your copy today. Use the coupon, or a postal to Dept. A.

Wayside Musings

THE FRIENDLY HEART

JOSEPH S. MORRIS, WISCONSIN

THE great friend of humanity—Jesus—gathered His friends around Him and talked to them. They would sit down by the seaside, or upon the mountain, or gather by the wayside. His companions would gather close to Him and the people would gather round. All would sit down on the ground and then He would begin to talk to them and teach them truths that would warm their hearts. His method has always had a strong appeal for me. As I grow older I have less and less heart to listen to oratory. There is too much of it that seems like using force to get us to think the way the speaker thinks. The truth is that we can never give intelligent assent to a proposition until we have had it made clear to us, had time to "digest" it, and have made it our very own.

I have often thought that it would be one of the finest things in the world to have in every community a warm and cozy and appealing room to which men and women, young people, aye even little children, might go to meet a teacher with a friendly heart. A friend to whom they could bring their troubles, and burdens, and difficulties, their secret heartaches and "talk them out" under the smile of a friendly heart. Such a friend as could comfort, council, advise, and send them on their way with a new found joy and a new grip upon life. After all, life is not easy for any, and many there be who lose their way because they have not had a friendly guide and counselor at the critical moment.

And this leads me to say that every home should have its sanctuary, its inner counsel chamber. Have time, and take it, to gather round in a family circle of friendliness—father, mother, children, young and old. Give these young lives a chance to speak openly. Invite frankness. Carefully, gently, in friendly, kindly fashion reprove, correct, instruct, approve, as frequently as possible, but never, never, seek to suppress. Our children are often wrong in their conclusions. It is a fine thing for a father to be able to say to that son who knows just about all there is to know: "I know how you feel, Mr. Man; you think you are absolutely right and you just can't see why the rest of us are unable to see the thing in your way. I know all about it, for I have lived a few years longer than you and have learned not to be so cocksure about things. It's all right to have strong convictions but spend a lot of time to determine that they are right and you'll get on quite well. Sometimes I may be wrong in opposing your views and when I find I am, I will tell you so. Trust me. I want to be your best friend." And it is a fine thing for the mother to keep the bond between herself and her daughter so strong and loving that the daughter will always and gladly go to her mother with her problems and difficulties. Remember, fathers and mothers, that the road over which your sons and daughters must travel is in some respects like the road over which you travelled as ignorant boys and girls. Your job is to help them to keep to the right but not to attempt to discourage them from venturing out.

Mothers and fathers of the farm homes are necessarily much closer to their children than is frequently the case in the city home. Much of the guidance they get they must get from you. City young people frequently get help from sources not available to the farm young people. Farm fathers and mothers are, by circumstances, kept in closer touch with their boys and girls. This is best for the young people and it is best for fathers and mothers for it makes them keep young with their children.

After we have had these chatty times together, when we have sat down and talked things over, and each has been permitted to say his humble say, wouldn't it be a fine thing to invite the great Master Friend to talk with us all? Is that possible? Yes! He said: "I will come to you."

No one would be willing to admit that their religion was good on one special day of the week and not on all the other days, and yet, isn't it true that often when we need it most we fail to use it?

I often think of the great host of spiritual leaders all round the world and wish for them all the Master's habit of the Friendly Heart.

SALE ANNOUNCEMENTS

Sept. 26—Guernseys. W. E. Wright, Akron, Ohio. Ohio Guernsey Breeders' Ass'n., Wooster, Ohio, Sale Managers.
Sept. 27—Holstein—Pierce—St. Croix Annual Sale, River Falls, Wis. Twin City Pedigree & Service Co., Mgrs.

A Premium for Bacon Hogs

HOARD'S DAIRYMAN: — Conditions of the export market for American bacon have gradually but surely developed unfailing signs of declining prestige, with resulting lowering of values as compared to those obtained by our competitors, principally the Danes, and a careful analysis of the situation brings the realization that while our product leaves little to be desired as regards trim and cure, it falls far short in selection and quality.

Both these factors can only be controlled by our hog producers, the farmers, as no matter how carefully the meat is handled, it is a physical impossibility to stretch or otherwise mold faulty sides of Wiltshire Bacon; and likewise there is no known process of producing streaky bacon from fat, soft, and oily carcasses.

It is, and will remain, a problem for the farmers to solve by proper breeding and feeding methods, and the time is ripe to consider this question seriously if we do not wish to see our products forced out of the British market.

The firm of Cudahy Brothers Co., Wisconsin, who are large exporters of bacon for the English trade, have found it imperative to institute certain measures whereby they hope to awaken the interest of the farmers sufficient to insure a grading up policy toward the bacon type hogs and thus create a desirable source of supply for their export business.

It will be their policy to assist wherever possible in the formation of breeding clubs, arranging for local fair competition, helping out with educational demonstrations, and last but not least, they are prepared to pay premiums for hogs of recognized Yorkshire breeding.

The preference for Yorkshires is based on the actual performance of this breed in the bacon improvements of hogs in Denmark, Great Britain, and Canada, which countries have so far outstripped the U. S. A. in the manufacture of choice, lean Wiltshires sides that an actual difference of from three to five cents per pound exists between theirs and our American bacon. The secret of success in this particular trade lies in the ability to furnish an even, uniform, and well balanced selection of lean, fine grained, and streaky sides of bacon which can be depended upon to cut out to advantage and will contain a maximum of choice back and other high priced parts of the carcass.

Without a doubt the Yorkshires have proved themselves to approach this goal in general more than any other breed of hogs, and we may as well face the situation for what it is by acknowledging a preference for the breed that so far has proclaimed its superiority in the transmission of bacon qualities.

A select bacon hog weighing between 180 and 220 pounds should possess a side measuring 28 inches to 30 inches from edge of first rib to the ham knuckle bone, and not exceed 14 inches in width anywhere on the side from back to belly. The shoulder should be trim and neat, while the jowl must be light and firm, and the ham must be fleshy and tapering low on the hock with no superfluous fat on the outside. Belly must be trim and correspond in thickness to the back fat, which preferably should be evenly distributed from neck to ham and not exceed 1¾ inches.

Any hog fulfilling these conditions and besides showing a good quality of firm, white fat and good texture of lean meat and skin is acceptable as a premium bacon hog, but it will not be hard to understand that one breed of superior bacon lineage can be relied upon to produce a larger degree of uniformity in the products than two or more breeds with slight or more pronounced diversions due to variations in breed characteristics.

After all it is a special business this bacon hog must cater to, and it requires special procedures to establish a first rate article for which sufficient money can be realized in order to warrant the payment to producers of a premium.

The premiums will vary according to the infusion of bacon blood so that hogs of first cross sired by Yorkshire boars will be paid with 25 cents per 100 pounds live weight extra, while second crosses or three-fourths bred Yorks can demand 50 cents per 100 pounds premium, and full blood Yorkshires will receive 75 cents over and above market price of similar weight hogs of lard type.

There is no illusion on the part of the company that a first or even second cross of Yorkshires on the ordinary sow stock in the state will perfectly remodel the progeny, but it is recognized by them that the producers are somewhat handicapped for breeding stock in making the change, and it will therefore prove a helpful feature to farmers that this arrangement can be carried on for at least three years after which time the premium will only be paid on select hogs regardless of immediate ancestry. In our neighboring country, Canada, there never was any discrimination shown farmers in this respect. They have to produce a top-notch bacon hog in the first place, before any cash consideration comes their way, and in many cases it has served to discourage rather than promote the bacon type that so scant a percentage of hogs graded "selects" or markets.

It is to be hoped that dairy farmers will embrace this opportunity to get a fresh start in the hog raising, thereby finding both a ready market for their surplus skimmilk and a profitable purveyor of their two safest and most reliable crops, barley and alfalfa.

Tropical Competition and the Dairyman

HOARD'S DAIRYMAN:—Dairymen generally may not be aware of the increasing competition being given them by cocoanut and other oils from tropical regions. Of course, the one way in which this competition is felt is through the manufacture of oleomargarine into which these tropical oils enter. There are two ways, then, for the tropical oil competition to increase. One is through the increased total production of oleomargarine and the other is through the increased percentage of these oils used as raw materials in oleo. To judge the competition from the increase or decrease in the total production of oleo does not tell the whole story and that is what we wish to point out in this discussion.

It is quite well known that the production of oleo increased considerably during the war period. In fact, from 1916 to 1920 the increase was from 150 to almost 400 million pounds. Since 1920, however, there has been a decided decrease amounting to almost 200 million pounds in two years' time. Apparently this has been a source of satisfaction to dairymen, and rightly so, but it is important to see the whole situation. The decrease in total production does not represent a corresponding decrease in tropical competition. This is very well shown by a study of the raw materials that went into oleo since 1916. The most significant point is the extent to which coconut oil is replacing the other raw materials in the manufacture of oleo. In seven years the amount of coconut oil in oleomargarine increased from a fraction of one per cent to about twenty-five per cent. During the same period the amount of cottonseed and peanut oils used dropped eight per cent and the amount of animal fats and oils like butterfat, oleo oil, and neutral lard decreased over 12 per cent.

Tropical oil competition is not decreasing, therefore, as the decrease in total production of oleo would indicate. In fact, it is increasing since coconut oil has become one of the very important factors in the difference in cost of butter and oleo.

What does the future hold in store for dairymen? One can safely make only a limited number of observations. First, the butter substitute industry and the whole coconut oil industry of the tropics were unduly stimulated during the war period and they have apparently suffered more from the depressed conditions since the war than the dairy farmers themselves. Second, while the high prices prevailing during and since the war along with the depression tended to increase the consumption of substitute butters, that situation has been changed somewhat now more to the advantage of the buttermaker. This is probably true that it will be many years before the oleo makers can again give the buttermakers the competition they gave during the recent war and after-war period.

One of the very important points revealed by a study of butter substitute consumption is this: The rate of consumption is determined by the price of butter more than by its own price. In other words, oleo is consumed because butter is high priced, not because of a preference for the substitute. This leads to another observation: The consumption of butter decreases when the price is high regardless of whether or not there is a cheaper substitute available on the market. This is very well demonstrated by a study of butter consumption since the Civil War. During the Civil War butter sold for 50 cents a pound wholesale in New York and the consumption fell to less than 15 lbs. per capita. From 1870 to 1900 the price fell gradually to 20 cents a pound and the consumption increased to almost 20 lbs. per person. This was the highest rate of consumption of butter reached in the United States since the Civil War. From 1900 to 1920 the price increased gradually at first and then sharply after 1915. Consumption, on the other hand, fell back to less than 14 lbs. The point is this: Butter consumption decreased during the decade from 1910 to 1920 not primarily because of the presence of a cheap substitute but because the price of butter had been relatively high. This is an assumption based largely upon the fact that the same thing happened during the Civil War without a butter substitute on the market.

In view of the foregoing situation this one suggestion is made: In price lies the most effective weapon the dairymen have against tropical competition. The majority of American people prefer butter and are willing to pay a premium for it but there is a great mass of people of limited means, including a great number of dairymen, who feel that this premium often gets too great and they buy substitutes instead. A careful study ought to be made to determine what premium different classes of people will pay for butter over oleo. So long as a pound of oleo will spread as many pieces of bread as a pound of butter and so long as the difference in price is unreasonable in the popular mind, educational work based upon the health qualities of the respective products will not prove permanently helpful. The economic argument for consuming oleo is apparently more convincing to many people than the health argument for consuming butter.

There is certainly no happy solution to tropical oil competition. It is simply a challenging economic situation which will likely swing forward and backward as time goes on, first to the advantage of the dairyman and then to the advantage of the oleo maker. From the experience of the past this can safely be said: The cheapness of substitutes will never drive butter from the American dining table, neither will the health qualities of butter and the desire for the genuine product ever drive oleo from the market. However, the presence of the substitute will likely serve to limit at times the price of butter on its upward trend and this is its most serious aspect.

Wisconsin. GEORGE F. JOHNSON.

Business Manager for New York Guernsey Breeders

B. J. H. Rikert, a graduate of the College of Agriculture at Syracuse University, has been appointed business manager for the New York State Guernsey Breeders' Association, Inc., with office at 302 Fayette Park Building, Syracuse, N. Y.

The New York State Guernsey Breeders' Association, Inc., was organized in May, 1922. The Association has a large membership of Guernsey breeders; 28 county associations affiliated with it and a number of junior calf club members. It has done much to promote the breeding and improvement of high grade and pure-bred Guernseys; it has given considerable aid to its members in buying and selling first class animals and has developed several markets to take Guernsey products at a premium.

Mr. Rikert was born and reared on a general dairy farm in Dutchess County. In college he specialized in animal husbandry. During his senior year he was student instructor in animal husbandry and also had charge of two classes of short course students. In the fall of 1920, he won both silver prizes in judging horses and cows at the State Fair. The same year he was a member of the college stock judging team which judged at the National Stock Show at Chicago. Mr. Rikert brings to the Association an experience of two years' agricultural organization work in this state and Minnesota.—L. A. TOAN, President.

Bessie, aged four years, who was down town with her mother, caught sight of a baldheaded man.

"Oh, mother," she exclaimed in high, shrill tones, "just see that man! He hasn't a hair on his head. Isn't it sad?"

"Hush!" replied her mother. "He will hear you."

"Oh," replied Bessie in subdued tones, "doesn't he know it?"—Everybody's Magazine.

GUERNSEYS

150 GUERNSEYS

O. G. CLARK & CO

Will Sell at

West Salem, Wis.

Thursday, Oct. 16th

150 high grade, springing Guernseys, cows and heifers. All the offering are young, big and sound, a few fresh, balance soon due. Everything Tuberculin tested. West Salem is easy to reach and easy to ship from. Attend this sale.

O. G. CLARK, Mgr.

Born Aug. 22, 1918
Sire—Anton's King Confidence 43517 A. R.
Dam—Heartsome of Prospect 26602 A. R.

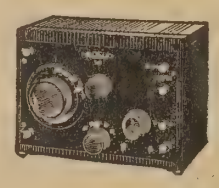
A cow we recently sold to the University of Wisconsin. She was bred and raised on the Hoard's Dairyman Farm. At the annual Little International she easily won the Guernsey female Grand Championship. The man holding her is Gordon Vial, who had charge of her at the University Show. How about your next herd sire?

HOARD'S DAIRYMAN FARM, Fort Atkinson, Wis.

Radio Time
-- Is Here Now !

There is no need to "sell" Hoard's Dairyman readers on the idea of Radio. Everyone knows that radio is now practical for every home. Every home wants a radio receiving set.

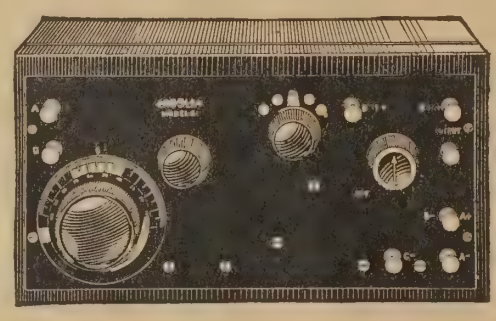
But wanting one and getting one are sometimes two very different things. It isn't always easy to see where that much extra money is coming from.



Here's a chance to get a receiving set without spending a cent of your money. It's a chance open to every reader of Hoard's Dairyman who is willing to recommend the "Dairy Gospel" to a few of his neighbors and friends.

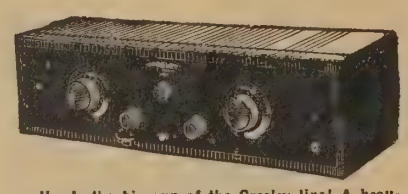
Just send the coupon at the bottom of this ad, and we'll tell you the whole story. And do it now. Don't wait. The sooner you get started, the sooner you will be ready to tune in. You'll be surprised to find how little work and time you will have to invest to get a good receiving set—complete, ready to set up.

Take Your Choice --- and send the Coupon NOW!



The first fellow who starts in your neighborhood will be the one who will get his subscriptions easiest and quickest.

Crosley Type 50



This is a one tube regenerative set—a little peach. It will bring in stations up to 1,000 miles or more good and clear on head phones. Very simple to erect; inexpensive to run, and easy to tune. The writer of this ad has one in his own home, and if he couldn't get another, he wouldn't sell it for $100.00, and it didn't cost anywhere near that!

The Crosley 51

This is a two tube set, which gives a little greater volume on long distance, and will operate a loud speaker on stations up to 500 miles away. The manufacturers claim this to be the most popular radio set in the world.

The Crosley 3R3

Here's the big gun of the Crosley line! A beautiful three tube set; so efficiently hooked up that it gives five tube results from three tubes. It possesses wonderful selectivity; brings in stations from great distances; is very simple to tune, and easy to "log"—which means that once you find a station with the dials set in a certain position, you can always get the same station when you set the dials there. No one needs or could ask for a better set than the 3 R 3.

C-O-U-P-O-N

HOARD'S DAIRYMAN, Fort Atkinson, Wisconsin.

I am going to do my best to earn one of your Crosley, Type..... Radio Receiving Sets. Let me know just how many subscriptions I will have to get and send me whatever you think I need to get started.

POULTRY On The DAIRY FARM

J. B. HAYES

Finishing Pullets

This season of the year is entirely too late for one to think of growing out a bunch of pullets for winter producers. That part of the scheme should have been considered at hatching time last spring. A late hatched chick will never develop as rapidly, economically, or reach maturity in as short a time as earlier hatches. Most of the late stock will always appear rather immature, never attain sufficient size, and will not start laying early enough to hit the market of high egg prices. With late hatched birds a proper feeding method will help but cannot work the miracle of making something worth while out of nothing.

In handling test cows a feeder is always careful to have the animals in prime condition before the real work starts. There must be a reserve established before the work starts, to assure a maximum production for a continued period.

Pullets that are precocious develop rapidly but never attain sufficient size and are apt to be a flash in the pan. One of the flock owners had an example one year that was typical of this condition. After a growth of about four and a half months, production started. This pullet was a little, undersized individual that was lacking in reserve. Her production during the year was shown by the trap nest to be a heavy lay of about twenty eggs that utilized the reserve and was followed by a resting period of almost a month. She finally finished the year with a rather low record. There was not enough chicken there to stand the grind.

It may be fine to own occasional pullets that start laying at an early age but there must be proportionate development. Early maturity is desired but not necessarily early production.

In order to properly produce, a pullet should be in prime condition. The fear of having hens too fat has been drilled into all of us so long that we are beginning to feel about the same in regard to pullets. There are more pullets that are poor producers because of improper condition than there are those that are too fat in the fall. We do not expect them to become flabby fat but prime condition is required. Sometimes it seems that one could be safe in stating that a pullet going into winter quarters cannot be too fat.

Mash feeding is a wonderful asset in the right place but can often be overdone. A properly compiled mash will mature pullets too quickly when fed in unlimited quantities. A proper proportion between mash and grain feeding is necessary for best results. One needs to feed rather heavy on grain and then allow as much mash in addition as they will consume. Under some conditions the hopper feeding of grain as well as mash is advisable.

A regular scratch mixture that is rather heavy in corn will be found satisfactory. Even a straight ration of corn may be fed when the mash is properly balanced. Grain will put on flesh and that is the ideal that one should strive to attain.

Young stock should be moved to the laying house before they are fully matured and production has started. Quietly moving them at this time will not cause any damage while a later change will seriously hamper production. About the middle of September to the first of October should be set as to the time to make the change. After housing for about a week they will become accustomed to the new quarters and will return each night if released. In cases where development is a little bit slow, a more rapid maturity will be experienced when the stock is housed. Under no conditions should the flock be released again after the first break in the weather. They will feel a great deal more comfortable if confined.

All the windows should be removed from the house during the summer and kept out until cold weather. Every time that the young stock begins to roost on the window sill along the nests next to the windows or in other adjacent places, we feel that it is just an expression of their wayward disposition. When one considers, though, that these birds have been roosting in trees or other places where fresh air was abundant it is partially explained.

Colds are caused each year from lack of ventilation. Allowing the windows to remain open overcome this objection and prevents part of the trouble. A stuffy, poorly ventilated building will cause the flock to feel the same way. As the season progresses one can adjust the ventilation to meet the conditions.

In cases where development seems to be a little bit slow, one can hasten growth by the use of a moist mash. Using a dry mash of equal parts ground corn, ground oats, wheat middlings, wheat bran, and meat scrap or digester tankage moistened with milk will give the extra feed needed to start production. Some pullets are just like a train on a steep grade that needs just a little more push to get over the top after which they can sail along on their own power. Moist mash feeding will supply the extra push.

This material should be given to them at noon during their regular resting period. Feeding at this time will not interfere with the consumption of other feeds but does give the finish. In all cases the mixture should be crumbly but never sloppy and given only in an amount that will be consumed in about fifteen minutes. Any that remains should be removed and the feeding troughs scraped clean.

Iowa Station Report, 1922, gives comparison of semi-solid and dried buttermilk with fresh buttermilk for fattening poultry which shows that the fresh buttermilk is superior to either of the dried products. Preliminary results of a test of different feeds for egg production indicate that dried and fresh buttermilk are superior to tankage and beef scrap.

If you want to trip someone on a catch question just ask what a baby chick would say if the mother hen laid an orange. Of course, your friend won't be able to answer, so you wisely reply, "Oh, see the orange marmalade."

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Johne's Disease of Cattle

When a cow or a younger animal of the herd persistently scours yet retains appetite but becomes more and more emaciated and finally dies, Johne's disease, also called "chronic bacterial dysentery", may be suspected as the cause. This insidious disease has been recognized for some years and was first discovered by Bang, in Denmark, but took its name from Johne, another noted scientist, who isolated the casual germ. Cases of it have been found here and there in some eight states, but the disease has never become prevalent like tuberculosis to which it is somewhat similar in both its symptoms and the character of its specific germ. It is more prevalent, however, than is generally suspected and often has not been correctly diagnosed, being taken for the last stages of tuberculosis when the affected animal became almost "skin and bone" in condition. Fortunately it is now possible to test cattle for the disease in much the same way that tuberculosis is detected. The biologic used is called "Johnin". This diagnostic fluid was first prepared by Twort and Ingran, in England, and later has been produced at the Wisconsin Agricultural Experiment Station and successfully used for the detection of the disease. Notable work in that connection has been done by Professor E. G. Hastings, bacteriologist, and Dr. B. A. Beach, of the veterinary department of that institution, regarding which full particulars are given in Bulletin 343.

At the time that bulletin was published the Johnin test was in its experimental stage, but over 1000 cattle had been tested and the disease was found present on post-mortem examination in 29 out of the 30 reacting animals. The test is of great importance, as presence of the disease can thereby be detected while it is yet in a dormant or incipient stage, as well as corroborating the diagnosis of suspected Johne's disease in a wasting, emaciated animal. Veterinarians should apply the test when suspicious cases are found and meanwhile should study the bulletin mentioned as should owners of valuable cattle. By use of the test, elimination of reactors and disinfection of infected premises it should be possible, in time, to stop the spread of the disease.

The Wisconsin bulletin states that the most striking symptom of Johne's disease is the gradual loss of flesh. This continues until the affected animal becomes a mere skeleton. The eyes remain bright but become sunken. Milk yield shrinks and eventually stops. Appetite is not impaired, nor is fever ever present, as a rule. Tuberculosis naturally is suspected when these symptoms are seen but the animal fails to react to the tuberculin test. When that occurs the likelihood of Johne's disease should be understood and Johnin used to determine if it is present. Meanwhile the suspected animal should be isolated and the pens and soiled bedding disposed of in such a manner that infection will not spread from it to susceptible animals. Sheep as well as cattle may contract the disease, but they are much less commonly affected. Feed contaminated by the bowel discharges is probably the chief source of infection. A peculiar character of the disease is that it may lie dormant for years, then suddenly appear when some debilitating cause has lessened the resistant powers of the animal; also that the aggravated symptoms temporarily may lessen when the feeding is generous and all conditions are favorable to the animal, but they invariably return and eventually prove fatal. In the later stages of the disease the scouring or diarrhea may be constant, but in some instances it is entirely absent. Identity of the disease, apart from the test with Johnin, is largely dependent upon the post-mortem appearances and laboratory examination of tissues from the intestines and messenteric lymphatic glands. One of the most characteristic post-mortem lesions is thickening and an intensely wrinkled condition of the mucous membrane lining the small intestine, notably the last third, which cannot be smoothed out by stretching. The appearance and odor of the fecal discharges is also diagnostic, in some degree, of Johne's disease as compared with other forms of dysentery.

Abnormal Breathing

We have a fine Jersey heifer that will be fresh in November that has some kind of a thing in her nose. When it is hot weather she can't hardly breathe through her nose, but in cooler weather you can't hardly tell there is anything the matter with her. When she gets too bad she opens her mouth and then you can tell it is just in her nose for she breathes easy then.

Kensington, Kans. R. G.

In such a case it always is wise to have the tuberculin test applied by a veterinarian, as tuberculosis of the glands of the throat often causes loud or labored breathing. That disease is incurable and contagious and makes the milk dangerous for use by people or animals. If there is a tumor (polypus) in a nostril it may be removed if just inside of the outer opening, but if far back, it would be best to fit the cow for the butcher after her milk flow becomes unprofitable.

Drying off a Cow

Sometime ago I bought a Jersey cow. The man tells me she won't dry up before calving time. Is there any special way to milk her toward the last? I would not like to spoil her udder.

T. A. L.

The cow certainly should be dried off for six weeks before calving and the process should be started eight weeks before that time. As the cow is no doubt a persistent milker she should be kept off grass and put on a light, dry ration to check the secretion of milk, yet she should not be allowed to become constipated. It may be necessary to feed bran and oil meal to accomplish that. The drying off process consists of gradually lengthening the intervals between milkings. Milk once a day, then each other day and finally stop milking when the secretion has about stopped. If any sign of garget is seen frequent milking has to be resumed until it subsides, but camphorated salves or lotions should not be applied.

Obstructed Teat

I have a valuable young Holstein heifer that has an obstruction in one of her teats. We have to use a milk tube every time we milk her. Can anything be done to remove the obstruction without losing the quarter?

Gresham, Neb. C. E. B.

If a growth obstructs the flow of milk and is located just inside the orifice of the teat, a veterinarian can remove it by means of a special instrument. If the growth is high up in the teat it would be best to let a calf nurse or to dry off the secretion of milk in that quarter. If a stricture at the tip of the teat is the cause of hard milking it may be remedied by slitting down through it in four different directions with a teat bistoury. A veterinarian should be employed to operate. Continued use of a milking tube will be likely to cause ruinous garget.

Use of Young Bull

We have a well bred young Guernsey bull, sixteen months of age and well grown. Since this bull was fourteen months old he has served twelve cows. We did not intend to use him any more until he is two years old, but have a neighbor that is very anxious to use him on six cows. He wishes to breed them as fast as they come in heat, and we would like your advice on this subject. Do you think we would endanger the bull's future breeding powers by using him much more?

Mechanicsville, N. Y. D. G. R.

It would be unwise to let the young bull serve the neighbors' cows. A 12-month-old bull is better not to do service but if he must be used one or two cows is enough. Allow a bull of 12 to 18 months to serve five to ten cows; 18 months to two years, 10 to 15; two to 3 years, 15 to 25; 3 to 4 years, 30 to 50; and from 4 years to 5 years and up, 30 to 50 cows. If well distributed throughout the year the number of services may be somewhat increased over the conservative figures given here. Do not let the bull run with the cows. One service at a period of heat is sufficient.

Douching Solution

What solution is it that is used to wash out cows that fail to breed sometimes? What strength solution and how applied?

Haw River, N. C. W. K. S.

A great many different solutions are used for the purpose mentioned. For flushing of the vagina it is common to use a solution of two tablespoonfuls of salt or bicarbonate of soda per gallon of blood warm (100° F.) boiled water, introduced by means of a fountain syringe, or a nozzle, rubber tube, and funnel or large, clean pail having a spout fitted near the bottom to which the tube is attached. Veterinarians also use a ¼ to ½ per cent solution of Lugol's solution, or 1 per cent solution of hypochlorite of soda.

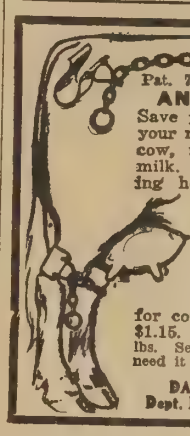
Lump Jaw

Kindly advise me if actinomycosis (lump jaw) in cattle can be cured. If so, what is the treatment?

Sparta, Mich. G. S. F.

Actinomycosis or "lump jaw" is curable when soft tissues are involved but treatment rarely pays when the bones are badly affected. Treatment consists in cutting out or sloughing out the diseased tissues. Iodide of potash is also given internally until symptoms of iodine poisoning (iodism) appear. It is then discontinued for some time but repeated later, if seen to be necessary. Two drams of the drug given daily in water have the desired effect. The treatment, however, causes weakness, emaciation, and shrink in milk flow, when iodism is caused, and may also induce abortion. A bulletin on the subject may be obtained from the U. S. Department of Agriculture, Washington, D. C., giving full particulars.

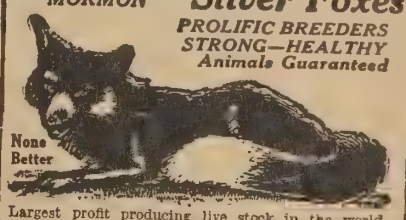
Tumors in Udder

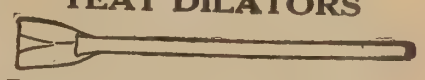


I have a Holstein heifer that freshened five weeks ago. Her bag was caked terribly but the cake has all gone now except in one quarter of the udder. There are two hard knots about the size of a goose egg in the udder and I am writing to ask if you can tell me what I can do to take these knots down.

Walnut Hill, Ill. E. C.

It is common for scar or tumor tissue to replace some milk-secreting gland tissue when the udder has been attacked by garget. Hard, insensitive tumors may also be caused by tuberculosis of the udder. To determine if the heifer is free from the latter disease, it would be advisable to have the tuberculin test applied by a qualified veterinarian, if that has not been done. Meanwhile, massage the affected parts two or three times daily and twice a week rub in some iodine ointment.





It PAYS to GRIND ALL GRAINS
Look to the Grinders. They do the work! Bowsher's Cone-Shape grinders are the correct principle in Feed Mill construction. They mean larger grinding surface close to center of Shaft; thus More Capacity, Lighter Draft, Longer Life.
"Desire to express my appreciation of the long-lasting, trouble-proof Bowsher. Have used a No. 4 ten years with less than One Dollar per year for repairs." *R. W. Watt, Jacobsburg, O.*

HOARD'S DAIRYMAN
Fort Atkinson Wisconsin

30,000 Ayrshires Tested In Scotland Last Year—

Averaged 7500 lbs. of Milk

These records are made chiefly on pasturage and hay on typical Scottish dairy farms and comprise herd tests in which every cow in milk is included.

In the United States Cow Testing Association records give the facts needed by a dairy farmer who desires to know the profitableness of every cow he milks. Such herd records show the high average production of the breed on American dairy farms.

EDWIN MARQUART'S HERD AT KNOWLES, WISCONSIN, for two years has led the Northeast Dodge County Association with an average herd production of 9,213 lbs. milk, 415.7 lbs. fat.

IN ELEVEN MONTHS THE HERD OF J. A. ERICKSON in the Moody County Association at Brookings, South Dakota, has produced an average of 7,803.6 lbs. milk, 322.2 lbs. fat, more than any other herd in the Association in twelve months.

IN THE MIDDLE BUCKS COUNTY ASSOCIATION, the grade Ayrshire herd of W. S. Bishop, Doylestown, Pennsylvania, led in production last year with an average of 8,890 lbs. milk, 388.4 lbs. fat.

THESE ARE HERD RECORDS—every cow in milk being tested. It is the herd average which tells the real story.

You can own an Ayrshire herd, which, under your own farm conditions, will average high yields of 4% milk year after year. Breeders near you will supply foundation stock at very reasonable prices. For their names and for further facts on Ayrshires, write

The Ayrshire Breeders' Association
10 Center Street, Brandon, Vermont

NETHER CRAIG FOOTLINE
SENIOR HERD SIRE

Sire:—HOBSLAND'S LUCKY BOY, the leading breeding bull of Scotland and America, whose dam, Hobsland's Surprise Packet, was one of the best daughters of our great foundation sire, Hobsland Innellan.

Dam:—NETHER CRAIG MISSIE, a great breeding cow whose produce stood first at 1923 National Dairy Show. She has made about 55,000 lbs. of milk in the last five years.

We are showing four bulls ready for service at the 1924 National Dairy Show, out of good Advanced Registry cows. These bulls are priced to sell.

77 - Registered Ayrshires - 77

ONE-HALF WISCONSIN AYRSHIRE CLASS LEADERS IN THIS SALE

The Ayrshire cow more nearly combines the qualities of correct dairy form, hardiness and high average production than any other dairy breed.

AYRSHIRE HIGH LIGHTS

1. Long life—Productive age range 3 to 20 years.
2. Very hardy—largely immune to ordinary cattle diseases.
3. High *average* production—both milk and butterfat.
4. Adaptable to a wide range of soil and feed conditions.
5. The best shaped udder of any breed.
6. Good quality of beef when put on block.
7. Good traits predominate. Grade up your herd with Ayrshires.

ALDEBARAN FARMS **RACINE WISCONSIN**

DISPOSAL SALE

Electric Pasteurization

There have been many and varied announcements of the pasteurization of milk with some form of electricity and the use of "violet rays". When sifted down none of these appear to have proven practical or satisfactory. We are, therefore, inclined to be skeptical about the practicability of the plan described in the following item from the U. S. Bureau of Commerce:

"Interest in Germany attaches to a so-called Scheidt process, named after the inventor, for the sterilization of milk by a system of producing ultra-violet rays in vacuum pipes made of thoroughly transparent quartz, employing at the same time the so-called Moore light. The milk is run in a thin layer along pipes so that it will be completely subjected to the rays. In order to be certain that the milk is uniformly distributed over the pipes, funnel apparatus is placed at certain locations where the milk is collected for re-distribution on the pipes.

"The process does not involve production of heat waves nor, it is alleged, does it alter the chemical composition of the essential ingredients of the milk. When the apparatus has been used for milk sterilization, it can be washed automatically with water. The water is in turn sterilized, and if it emerges from the apparatus in a clear state, it can be further used for spraying out milk cans or other containers."

Thunderstorms and Sour Milk

Do you believe that thunderstorms cause milk to sour? It is generally believed they do. The souring of the milk is generally attributed to the electrical action between clouds, which is responsible for the lightning associated with thunder storms.

There is no relationship between these electrical discharges and the souring of milk. Some authorities report that electricity will destroy bacteria or retard their growth. In such cases electrical action would cause milk to keep longer.

Souring of milk is caused by a growth of bacteria which feed upon the milk sugar and convert it into an acid when the milk is held at a warm temperature. The acid sours the milk.

It is believed that the temperature conditions immediately preceding a thunderstorm cause the souring of milk. Thunderstorms usually follow a period of hot, humid weather. The heat and humidity cause the refrigerators, cellars, and cooling tanks to warm up. The milk is also warmed up, stimulating a rapid growth of bacteria, which really causes the milk to sour.—E. H. PARFITT, Purdue Experiment Station.

SHOW HERD WINS AGAIN

We have a small group of animals on the show circuit again this year and they have been doing fine. Up to date we have shown at seven Fairs in the Middle West and have won

6 GRAND CHAMPIONSHIPS—12 CHAMPIONSHIPS—54 FIRSTS

Our young stuff by our herd sire, FINANCIAL BEAUTY'S KING, 132904, Silver Medal Sire, has done exceptionally well.

We have some bull calves by this sire—also some by FASHIONABLE FERN LAD, 163968, twice Grand Champion at the National Dairy Show and winner of numerous other championships—that we are offering for sale at very reasonable prices. Some of them are out of dams with good Register of Merit records. These calves will win for you, not only in the show ring, but by increasing the production of your herd.

Write us for a descriptive list with prices.

DISPERSAL SALE!

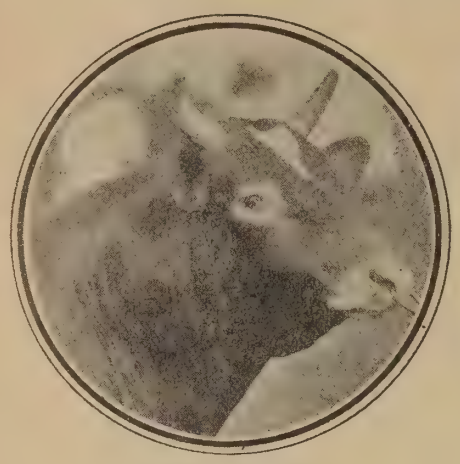
Egypt Mills Guernsey Club

Cape Girardeau, Mo., Oct. 7-8

EMINENT OF SARNIA 32963

The Egypt Mills Guernsey Club is a corporation founded in 1919 to develop and promote the breeding of pure-bred Guernseys in Cape Girardeau Co., Missouri. The cattle used as a foundation were imported from the Islands and purchased in Wisconsin. The contract on which the cattle were placed with the farmers called for the dispersal of the entire foundation and increase at the end of five years' time. The five years is up and the cattle will be offered for sale at above named time and place. Included in the lot are many cows with A. R. and Cow Test records, many cows untested but capable of large records, 20 or more young bulls and a large lot of fine heifers.



The club was most fortunate in securing as a herd sire Eminent of Sarnia 32963, one of the great sires of the breed whose first 9 daughters tested averaged 566.6 lbs. fat in classes GG, G, G, EE, E, E, FF, D, and D. One of these sold for $5,000. There are over 70 daughters of Eminent in this sale, and most of the heifers not his daughters are his granddaughters.

Eminent of Sarnia will be in the sale, and is in fine condition and a regular breeder. This will be a wonderful opportunity to pick up foundation Guernseys that you know will be great producers.

Breed Character as Illustrated in the Herd Sires at Emmadine Farm

RESOLUTE 71989

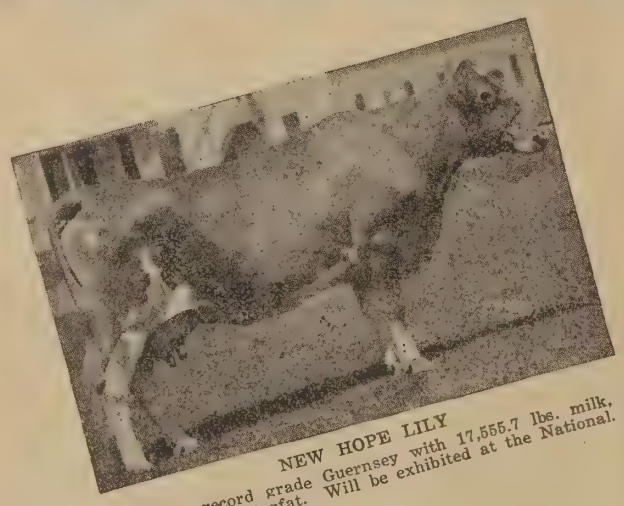
FIRST 16 OF GUERNSEY AGED COW CLASS, 1923 NATIONAL DAIRY SHOW
7 of these were shown by Emmadine and 4 were included in the first 10.

FOREMOST 39191

Our bull calves are the result of carefully selected crosses of the breed's best blood. Inspect our herd at the National Dairy Show and secure information that will help you in selecting your next herd sire.

Up to June, 1924, 21 of our cows made records averaging 12,640 lbs. milk and 629 lbs. fat.

Our Successor Berkshires well merit the attention of every farmer interested in breeding profitable hogs.



At the New York State Fair, 1924, we won both Grand Championships—the aged bull, 2 year-old bull, aged cow and Senior Heifer Calf classes. Also the following groups—Get of Sire, Exhibitor's herd, Produce of Cow, best 4 cows over 3 years old.

100
PURE BREDS
—
200
GRADES

NEW HOPE LILY
World's record grade Guernsey with 17,555.7 lbs. milk, 887.74 lbs. butterfat. Will be exhibited at the National.

BOB'S ELDERON MABEL
Class leader in C. C. with 816.9 lbs. fat, 16,952.3 lbs. milk. She is a member of our show herd.

WE HAVE FOR SALE

20 PUREBRED COWS — 60 GOOD GRADES

THE PURE-BREDS are cows with official records and two-year-old heifers. Part of them are bred to a May Rose bull whose dam has a 732-lb. record.

THE GRADES include heifers and heifer calves, all by excellent registered sires, many of the older heifers bred for late fall and early winter freshening.

This is a herd that has been built up primarily for production. Our show herd, consistent winners this fall, prove the type we have obtained. A clean herd of the kind we believe you want to buy from.

SEVERAL GOOD BULLS

One of these is a first class two-year-old, Corium Raider Durand. He is sired by a son of Border Raider whose dam, a daughter of Gov. of the Chene, produced 629.5 lbs. fat in Class F. His dam, a granddaughter of Border Raider produced 738 lbs. fat. You will like him.

Another 2-year-old bull sired by a son of May King's Vrangue of Ingleside out of a dam that produced 459.07 lbs. fat in Class E. A very good individual. Other young bulls from a few weeks to 14 months old from A. R. dams with records up to 612 lbs. fat.

See Our Show Herd at the National — The twenty-four head we have had out this fall have placed well at Aurora, the Wisconsin State Fair, the Michigan State Fair, the Illinois State Fair, and the Dairy Cattle Congress. We invite you to inspect them at the National.

If you wish to purchase good Guernseys, see us at The National or come to Fern-Dell Farms. You will find our prices reasonable. We will gladly meet you at Green Bay if you will let us know in advance.

LARSEN'S FERN-DELL FARMS, A. W. FOX, Manager Green Bay, Wisconsin

Connecticut Holstein Record

Connecticut's new champion Holstein cow for ten months' production as a junior three-year-old is Nutmeg Elsie Hibma, owned by F. M. Peasley. In 305 consecutive days she produced 16,630.5 pounds milk containing 615.32 pounds butterfat, equivalent to 769.1 pounds butter, according to the Advanced Registry Department of the Holstein-Friesian Association of America.—Extension Service Holstein-Friesian Association of America.

The great advancement of the world throughout all ages is to be measured by the increase of humanity and the decrease of cruelty.—SIR ARTHUR HELPS.

BROWN SWISS

ANNOUNCEMENT

KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Herd fully accredited, Certificate number 65301

Wisconsin Dairy Show Sale!

— TO BE HELD AT —

WAUKESHA, WIS.

Monday, October 6th, 1924

FOLLOWING DAIRY SHOW

Committee Cut Sale to One Day — Less Numbers, but More Quality

The Females in the Sale

Include Many Offerings From Truly Wonderful Bulls

A good list of Matador Segis Walker's daughters including: A 21-lb. 3-yr.-old; a 2-yr.-old daughter of a 30-lb. dam, with over 1000 lbs. butter for the year; 2-yr.-old from a dam with 800 lbs. butter and 20,000 lbs. milk in a year as a 2-yr.-old; 1st calf heifer with over 24 lbs. and bred to Carnation Segis Prospect; a good record daughter of a 35.83-lb. cow, and bred to Carnation Segis Prospect.

Two granddaughters of Matador, one from a 26-lb. dam, both in calf to a finely bred Homestead bull.

Three full sisters sired by Sir Bess Ormsby Fobes, and from a World's Record dam. Two bred to Creation. This trio is hard to beat. Chance for Foundation Herd.

A 35.83-lb. foundation cow with the following records: 21 lbs., 2 yrs.; 23 lbs., 4 yrs.; 33 lbs., 5 yrs.; 35 lbs., 6 yrs.; and nearly 1000 lbs. butter in a year. Two of her daughters in the sale also.

Drafted—One of Wisconsin's Greatest Producers. The old fashioned kind. A cow with 31 lbs. butter in 7 days, 1197 lbs. in a year, and 28,900 lbs. milk. Due soon after the sale.

An Outstanding Daughter of Creator, from a 32-lb. 3-yr.-old dam; next dam, 34 lbs. In calf to the Prilly bull. This wonderful heifer has everything to be desired in a Dairy Heifer.

A fine 30-lb. cow; a 29-lb. cow; a 27.39-lb. cow and her two daughters; a 23.73-lb. daughter of King Pontiac of Brothertown; a record daughter of a 30-lb. dam, next dam 35 lbs.; a good record daughter of King Superba; a 20-lb. 2-yr.-old due right after the sale to King Bess 6th; a daughter of Bairdland Segis Sirprize, bred to a full brother to the Grand Champion bull at Wisconsin.

Two daughters of Marathon Aaggie. Bred to the 42-lb. bull, King Bess Burke Ormsby.

A daughter of King Bess Burke Ormsby, bred to a son of Iowana Sir Ollie.

One of the nicest things in the sale—a daughter of a 29-lb. cow, and from a 41-lb. sire. Due right after the sale. A beautiful heifer.

A 2-yr.-old granddaughter of Count, and from the foundation cow, Pauline Aaggie Grace, 31:50 lbs.

A Wonderful List of Bulls

Popular Breeding

A son of Sir Pietertje Ormsby Mercedes 41st. From a 30-lb. 4-yr.-old daughter of Iowana Sir Ollie, with nearly 1000 lbs. for a year. A Classy calf and lots of breeding.

A son of Marathon Aaggie from the 33-lb. 4-yr.-old state record daughter of King Bess Burke Ormsby.

A great grandson of old Sir Pietertje Ormsby Mercedes. His dam has 1080 lbs. butter for the year. Good breeding.

A remarkable bull calf sired by Carnation Segis Prospect and from a 30-lb. 3-yr.-old daughter of Matador Segis Walker, now on year work. A bull with a future.

A long distance grandson of old Sir Piet., and from a 945-lb. 2-yr.-old granddaughter of Count.

A son of Ormsby Princess Lad Son. His dam has 33 lbs. butter in 7 days, 648 lbs. milk.

A 27-lb. grandson of King Segis Pontiac Count.

Several bulls from the Show Circuit, including a Jefferson Co. Show bull, a Jr. Champion at Wisconsin, a son of the State Record cow with 832 lbs. milk in 7 days and 3400 lbs. in 30 days.

Two wonderful aged bulls. One, a son of 37th, a good individual of great dairy type. This bull has produced a good list of daughters, either in A. R. O. production or show ring achievement. The other aged bull is a Show Bull. Having won his class several times at Milwaukee in younger form, he comes back this year as a 5-yr.-old and stands third in one of the greatest bull classes of our breed. His daughters in the sale will look well.

In selecting the cattle for this sale, the Committee has taken great pains to have each animal qualify for a sale of this kind, if not always in regard to records, without exception in regard to Dairy Qualities and Future Promise.

PURE-BRED HOLSTEINS LEAD WISCONSIN'S COW TESTING ASS'NS

A Holstein Herd is Highest in 165 Associations

"Canary," A Holstein Leads Them All for 1924

--Support the Cow Testing Ass'n

PAULINE ORMSBY DE KOL CANARY

A pure-bred Holstein, the highest cow of all breeds in Wisconsin's 165 cow testing associations. In 323 consecutive days she produced 22,914 lbs. milk and 839 lbs. fat. Owned by Leo Kuhl & Son, Hazel Green. Clarence Kuhl, the man in the picture, fed and milked "Canary" during the entire test period. "Canary" is from Wisconsin's leading Cow Testing Association herd consisting of thirteen pure-bred Holsteins. These thirteen Holsteins produced an average of 15,118 lbs. milk and 534.5 lbs. butterfat during the last association year. The average net profit over feed cost was $196.00 per head.

Is YOUR HERD in a Cow Testing Association ?

As preliminary and supplementary to Advanced Registry work each breeder can benefit directly by entering all of his producing animals in a cow testing association.

There are four outstanding reasons why every dairyman should be a member of a cow testing association.

1. It helps to reduce feeding costs.
2. It weeds out the poor producers at small expense.
3. It points out the cows best qualified to be placed on official or semi-official test.
4. By obtaining cow testing association records on all the daughters of the herd sire his breeding value is indicated definitely and quickly at a minimum cost.

The cost of testing a herd of thirty cows or less in a cow testing association averages approximately $40.00 per year. Besides the above mentioned outstanding advantages cow testing associations when universally adopted will help to stabilize the entire dairy industry by getting rid of unprofitable milk producers, the real cause of surplus dairy products.

If you are not in a cow testing association NOW, See Your County Agent.

Cow testing associations deserve the active support of every Holstein owner. The Cow Testing Association Manual just completed will be sent to you free upon request.

BUY AT MURPHY FARMS

Your Herd Sire — Foundation Females

Murphy Farms, the home of Wisconsin Fobes 5th, has a herd of 170 registered females representing the best blood lines of the country. Ninety-two 7-day records have been completed there in the last four years and 48 of our milking herd have finished excellent year and 305-day records, including 6 that are state champions in their classes. Twenty-five cows are now on test, one promises to become Wisconsin's first 30,000-lb. cow within the next two months.

Our Herd Sires Are

AMBASSADOR FOBES—a son of 37th and that Grand Old Cow, Wisconsin Fobes. He is a full brother to "Fobes 5th."

PRIDE OF THE SIR PIETS—a son of Wisconsin Pride 2d, world's record daughter of "37th", and by Marathon Bess Burke.

We Have For Sale—

Sons of these sires from a few weeks old to those that are serviceable. Most of them are from A. R. O. dams. We have a few from non-record dams.

Several good cows and heifers, offered because our herd has now reached the size where we must begin to sell good females to make room for daughters of our own sires. All of these have good records or are from tested dams.

Every animal sold from Murphy Farms must be exactly as represented. You will find our prices very reasonable.

Farms at Egg Harbor Door Co., Wis. **MURPHY FARMS** Office 303 Bellin Bldg. Green Bay, Wis.

JEFFERSON COUNTY —HOLSTEINS—

See them at the National!

Jefferson County has good Holsteins and in order that those who do not visit the county may know something of the kind we breed, we have for the past several years sent a representative county herd to several of the larger fairs. We will have such a herd at the National Dairy Show this year and we invite you to inspect it.

At Aurora, Ill., the Wisconsin State Fair and the Minnesota State Fair the herd won 17 firsts, 2 junior championships, 4 senior championships and 4 grand championships.

Are You Thinking of Buying? — Stop at Our Booth . .

Jefferson County offers decided advantages if you want to buy Holsteins. There are 1,000 herds of black and whites in the county; you have a chance to select just what you want whether pure-breds or grades.

Our secretary is employed by us to give you every assistance. He will gladly take you to visit those herds where such cattle as you want are for sale, and if you buy, he will get your cattle assembled, tested and loaded out for you. **This Service is FREE to You!**

Call at our booth at the show. It will be with the Jefferson County exhibit. We would like to tell you about Jefferson County Holsteins.

A Feature of the Sale

will be the four wonderful daughters of Sir Sadie Cornucopia, that average nearly 1,000 lbs. butter for the year. Their average weight is 1850 lbs.; they have made together 10 yearly records that average 825 lbs. All sired by the best son of Sadie Vale Concordia—the first 30-lb. cow. *This group includes the highest record cow ever sold in Iowa.*

HOME FARM DISPERSION TUESDAY— OCTOBER 14th

52 FEMALES 12 BULLS — At the Farm, Adjoining Chapin, Iowa — *An Accredited Herd* — *60- to 90-day Retest*

The Home Farm Herd, established in 1881, was for nearly 30 years the leading show herd of the Middle West—ranking in a class by itself not only for winnings in the prize rings but in the butter tests at fairs. The herd has been developed in recent years with the same ideals of type that characterized the early show animals and the average quality and conformation of the herd today is the best in its history. Every female in the herd except one has been bred on the farm.

There will be sold—7-day record cows up to 36 lbs. and yearly record cows over 1,100 lbs.; King Korndyke Sadie Vale 24th and 12 of his daughters; four daughters of Sir Sadie Cornucopia; twenty daughters of Woodcrest Sir Clyde.

Watch for further announcements.

Mankato Holstein Farms

DISPERSAL

MANKATO, MINN. 125 HEAD -- Oct. 8-9

Four Clean Tests --- Selling With Retest Privilege

MANKATO FLOA ORMSBY KORNDYKE LAD
The only bull in the world whose dam and sire's dam are 1000-lb. 2-year-olds.

SELLING—

RUBY KAREN MERCEDES
Butter, 7 days, 4 yrs. 35.03
Five records average over 900.
Daughter of Sir P. O. M. 14th.
Two daughters and a son also selling.

MANKATO FLOA ORMSBY MERCEDES
Butter, 365 days, 2 yrs. 1051.52
Daughter of Sir P. O. M. 14th.
A son and daughter also selling.

A Wonderful Offering of Foundation Ormsbys

The herd has been built up entirely on "Ormsby" blood lines and combines very closely the blood of SIR PIETERTJE ORMSBY MERCEDES and ORMSBY KORNDYKE LAD, the only sires in the world having sixteen 1000-lb. daughters. The foundation sire was the great show bull, Sir P. O. M. 14th. Following him came a son of King Korndyke Colantha Ormsby from a Bess Burke dam; next, Ormsby Korndyke Lad 8th, a son of O. K. L. from a 1000-lb. 2-year-old. The present herd sire include the only bull in the world whose dam and sire's dam are 1000-lb. 2-year-olds, and a son of Marathon Bess Burke and Ruby Karen Mercedes.

OVER 100 FEMALES—

FIVE COWS with records from 1000 to 1200 lbs. butter in a year and ten daughters of 1000-lb. cows.

FIVE 30- TO 35-LB. COWS and several sons and daughters of 30-lb. cows.

THIRTY-FIVE DAUGHTERS of Mankato Ruby Marathon Ormsby, a show son of Marathon Bess Burke (The John Erickson Sire) and Ruby Karen Mercedes.

TWENTY DAUGHTERS of Ormsby Korndyke Lad 8th, a son of O. K. L. from a 1000-lb. 2-yr.-old.

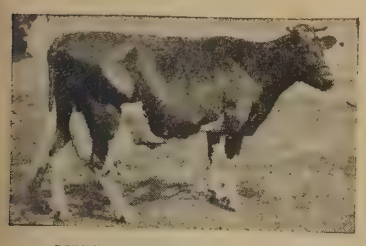
OTHERS BY Sir P. O. M. 14th, 22d, 37th, King Colantha Ormsby Bess, Sir Korndyke Bess, and other noted sires.

25 MALES—

MANKATO RUBY MARATHON ORMSBY—Senior sire. A show son of Marathon Bess Burke and Ruby Karen Mercedes, one of the only six cows having five consecutive year records averaging over 900 lbs.

MANKATO FLOA ORMSBY KORNDYKE LAD—*Only bull in the world whose dam and sire's dam are 1,000-lb. 2-yr.-olds.*

A YOUNG SON of the senior herd sire from a 34-lb., 1194-lb. daughter of Sir P. O. M. 14th.



A YEARLING SON of Sir P. O M. 43rd from Snooks Nig De Kol who made 1,078 lbs. butter in a year.

Butter, 365 days 1,399.78
Milk 34,070.50
The Highest Year-record Cow Ever Offered at Auction

DUKE'S MIXTURE
Three-year-old son of cow at left and the $33,000 sire.

70 REGISTERED HOLSTEINS

A wonderful herd for type, breeding and high production. Herd is headed by DUKE PIETERTJE KORNDYKE ORMSBY, with DUKE'S MIXTURE, his 1399-lb. son, as junior sire. Nearly every female of milking age has a large record and the herd contains several first prize winners at State and National shows.

FEMALES

FOUR COWS with records from 1000 to 1400 lbs. butter, and up to 34,000 lbs. milk in a year.

TEN OTHERS with records over 800 lbs. butter in a year, most of them in heifer form.

FIFTEEN DAUGHTERS of Duke Pietertje Korndyke Ormsby, the $33,000 sire, with records up to 1100 lbs.

TWENTY-FIVE DAUGHTERS of Duke's Mixture, the 1399-lb. son of Duke Pietertje Korndyke Ormsby.

MALES

DUKE'S MIXTURE—The 3-year-old show son of Princess Aaggie Polkadot De Kol and Duke Pietertje Korndyke Ormsby. A bull qualified to head any herd.

DUKE PIETERTJE KORNDYKE ORMSBY 31ST—A 3-year-old son of "Duke". An outstanding show bull. First at the 1924 N. W. Dairy Exposition.

SONS OF "DUKE" and Duke's Mixture from high record dams.

IF YOU WANT SOMETHING CHOICE in a herd sire, attend this sale.

For instance:— painting woodwork first thing to do.

The joy of new paint

Away, every trace of dinginess! Woodwork, yesterday streaked and dull, today lights up the whole house with its fresh whiteness. Scratched floors that embarrassed beautiful rugs now set them off as a new frame enhances a fine picture. You can see your home begin to smile as each stroke of the brush covers an old surface.

LOOK on the "Guide" for the *right thing to use* for *woodwork*.

Consult the "Guide" before selecting the finish for *any* surface.

Something is wrong when a once beautiful room has to be done over again too soon. The chances are the wrong type of material was used.

Every expert knows that each type of surface (indoors and out) calls for its own type of paint. Paints must be selected according to *type*. The same is true of varnishes, of stains and enamels.

When you look at the Farm Painting Guide you look at authoritative recommendations. On a line with the surface to be finished you pick out the correct material as easily as you select a color from the color card.

Save this copy of the "Guide" for use when needed.

Your "Paint Headquarters" serves you with the Sherwin-Williams Painting Guide. It will pay you to look up this store.

You will know "Paint Headquarters" by the Painting Guide displayed in the window and inside the store. This store serves you intelligently, backed by the "Guide." The proprietor and clerks help you save money by avoiding mistakes. Look for this store and "follow the 'Guide'." It costs you nothing to be *sure*.

Write for free suggestions on your painting problems to the S-W Dep't of Home Decoration. Ask, also, for free booklet B 450 and the handsome set of color plates giving eight beautiful color schemes for different rooms. Send 50c (65c in Canada) for the 177 page book of valuable detailed information on beautifying the home. Reproductions of the latest color ideas for interior and exterior—a book you would not part with for many times its price. Write Dept. B 435 at address below.

Getting good work

Hire a good painter if you have big work that calls for help. Ask your Paint Headquarters to recommend a man. If you hire a painter, hire a good one.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 12 Fort Atkinson, Wisconsin October 3, 1924

500,000 More Customers were won by Ward's low prices and reliable merchandise last year. This book gives you the same opportunity for satisfaction and saving.

Are you getting your share of the Savings this Catalogue offers?

WHENEVER you need to buy anything for your farm, your home or your family, do you look through Ward's Catalogue? You will find here great assortments of just the things you want. You will see the prices you should pay — the lowest price for goods of dependable quality.

In buying from Ward's it is a satisfaction to know that you are getting the best goods and at the lowest prices that any one else pays.

Ward's Catalogue shows you the right goods and gives you the right price — always.

It is easy and pleasant to order from Ward's

Turning through your 726-page Catalogue, choosing the things you want at your leisure, not being influenced to buy this or that, but deciding for yourself the thing you like best — that is the modern, the satisfactory way of buying.

And you can select from Ward's Catalogue without any doubt of value and without the slightest risk, because you are protected by our 52 year old guarantee "Your Money Back if you are not Satisfied!"

Everything for the home

We try to picture and describe accurately every piece of merchandise, trying never to exaggerate, so that when you open your package you will be fully satisfied with your purchase.

> Read what Mrs. R. A. Bower of Toledo, Ohio, says:—"I wish to express my appreciation of your good service and the good quality of your merchandise. And I always receive my orders inside of a week and everything satisfactory. Many times I am surprised at such wonderful values for the price. It is a pleasure to order from your catalogue."

We say look through your Catalogue for everything you need to buy. You will be amazed to find how nearly all your needs will be met in this Catalogue.

The latest fashions, dresses, coats, hats, everything a woman wears. And everything for the home — furniture, carpets, the newest things for comfort and convenience — and always of Ward Quality.

By "Ward Quality" we mean just this — that we do not sell goods where the wear has been shortened, where the actual service an article will give has been lessened, in order to sell it a little cheaper.

We do not sacrifice quality to make a low price. We offer no price baits on "cheap," unsatisfactory merchandise.

Everything for the man and for the farmer's needs

Over 50 million dollars' worth of new merchandise has been bought and manufactured for this book. Bought for cash. Bought by our great international staff of expert buyers, in America, in Europe, wherever cash would buy the largest amount of actual value.

Whether it be something for the home — tools, hardware, radio; something for the car — tires, batteries, accessories; or something for the man's or boy's personal use — clothing, shoes — whatever a man needs or uses, this Catalogue offers it of standard quality at the very lowest cash prices.

Use this catalogue— its large savings may just as well be yours

You may as well benefit by the almost weekly saving this Catalogue offers. Each week you buy something. First look it up in your Catalogue. Use this book as millions of other families do. There is just as great a saving in this book each week for you.

Your orders will be shipped within 24 hours

Your orders are appreciated at Ward's. Your letter is opened immediately, your order filled at once, and your goods are on their way to you within 24 hours.

HOW PETER COLOGNA KEPT HIS BOYS

CLIFFORD FARMER, MISSOURI

SIXTEEN years ago Peter Cologna held a consultation with himself. His health was failing, his three sons were nearly grown and likely to leave him with the two hundred acres of timber land on his hands. Money was scarce, farming was not showing

PETER COLOGNA

a profit, so he could not blame the boys for wanting to turn to something more promising.

Then he had a vision. He had heard of the success other farmers had had with dairy cows and the idea of turning the place into a dairy farm suggested itself. The boys liked live stock, of that he was sure. He called them in and they talked the matter over. The outcome was that the sons agreed to stay and give dairying a try.

To finance such a venture money had to be borrowed and a local banker consented to a loan of $400. Out of this amount a cream separator was purchased, cutting the capital to $315. This amount was used in selecting all of the "four gallon" cows that could be found in the county for sale. But they soon found that a "four gallon" cow did not always give thirty-two pounds of milk. The first cream check, received October 5th, 1905, amounted to 51 cents.

But the Cologna brothers were made of the kind of material which succeeds in spite of mistakes. The dealer who sold them their cream separator gave them a trial subscription to Hoard's Dairyman. Following the advice they found in its columns, they bought milk scales and a Babcock tester and began culling the cows and replacing with better ones. From that time until the present, milk has been weighed at each milking and records kept, no guesswork being used in culling. In 1907 the records show receipts from the dairy herd had doubled that of 1905 but, with the herd averaging only 177 pounds butterfat and most of the grain to be bought out of that, there was only a very slight margin for a profit.

At first most of the feed had to be bought outside. Then as the timber was cleared out and the run-down spots that had been cultivated formerly covered with manure from the dairy herd, more and more the feed was homegrown. So well has the farm been built up in the years that followed that now legume crops grow abundantly, thanks to the barnyard manure.

The first bull was a nondescript sort of the all-purpose breed and his heifers were not very promising. Then a neighbor bought a registered Guernsey bull and offered to breed the Cologna cows for two dollars each. The old bull was discarded at once. From that time forward things were better. The heifers sired by this bull showed improvement over their dams, convincing the Colognas that Guernseys were good dairy cattle. So well did they like these calves that they went out and purchased a registered Guernsey cow of high producing ancestry. She arrived at the farm in the spring of 1907, marking the first introduction of females of the breed in south Missouri.

This cow was in calf to a good bull and dropped a bull calf which was retained as the herd sire. After that the herd made rapid strides forward, choice females being added from time to time and good sires being selected. Guernsey blood soon predominated in the grade herd. The grades were gradually culled out to make room for the pure-breds and at present the herd numbers around 100 head, most of which are pure-breds. The farm has grown to 600 acres, better buildings have been erected, modern equipment put in and the timber cut off to make room for clover, alfalfa, soy beans, and corn. The rougher land has been seeded in pasture grass, silos erected, and the whole farm built up to high productiveness.

The great amount of work necessary to carry on such a farm successfully has called for specialization. Joe, the youngest son, looks after the herd, John attends the creamery and Louis has charge of the crops.

In 1911 the Colognas made another stride forward when they decided to build a modern creamery on their farm in order to be able to market the quality products of their Guernsey herd at a premium. Success followed the venture. They found ready sale for their "Fancy Table Butter, a Quality Guernsey Product". Leading grocery men in surrounding towns were eager to handle it and soon a demand was created that took every pound of butter they could produce. A quality product was their aim and twelve years of marketing in this way has brought no complaints. An average of ten cents a pound above market price for butterfat has been received for their butter, to which may be added 18 or 20 per cent, the difference in butter and butterfat. This difference in 1923 amounted to $1,700, enough to pay many times over for the extra work necessary in marketing their cream the fancy butter route. Last year's total butter sales amounted to $7,500 and this year is expected to go higher with more cows in milk.

NELLIE OF KOSHKONONG PLACE 2ND, ONE OF THE PURE-BREDS ON THE COLOGNA FARM

Improving their herd by the use of better blood is given by Joe Cologna as the secret of their success. In 1907 the herd averaged 177 pounds butterfat. In 1920 and 1921, when Advanced Register work was done, the herd averaged 402 pounds. This was partly due, of course, to better feeding but principally to better individuals.

Peter Cologna has a right to be proud of the achievement of his sons and to thank his lucky star for the decision that made him start them into the dairy business. That decision has kept them together in one great family and has brought success to them all.

THE FARM DAIRY IN WHICH THE COLOGNA BROTHERS MADE BUTTER THAT LAST YEAR SOLD FOR $7,500

Uniform Production Plan

A committee representing the milk producers and dealers of Milwaukee, Wis., was appointed last April to study the plan which was in effect for the first six months of 1924 to see if any changes could be made which would make it more satisfactory to the majority of producers. The committee report reads as follows:

"After studying the situation, the committee finds the feeling of producers toward the old plan about as follows: Those who ship nearly the same amount at all times of the year feel that the amount permitted above the base quantity should be less, so as to throw more of the supply into the 'manufactured price' class, thereby lowering the percentage of surplus and increasing the 'average price'. Those who have fallen into the 'manufactured price' class feel that the penalty is too great because of the low price which they receive for the entire month's shipment.

"To overcome the objections of both groups, the committee suggests the following plan:

"The average monthly production of each shipper during August, September, October, and November, 1924, shall be considered their base quantity.

"During the first six months of 1925 all producers will receive the regular 'average price' for any amount up to one and one-half times their base quantity. For all milk above this amount they will receive the 'manufactured price'. (For example: If a shipper has a base quality of 10,000 pounds and ships 20,000 pounds, he would receive the 'average price' for 15,000 pounds and the 'manufactured price' for 5,000 pounds.)

"Adjustments in the base quantities may be made by the dealers in the following cases: 1. New shippers who did not ship during the base months. 2. Shippers who wish to permanently increase the size of their milking herds. 3. Shippers having a low base quantity because of some cause entirely beyond their control.

"A list of all adjustments made shall be given to the Milwaukee Cooperative Milk Producers at the end of each month.

"Each shipper's base quantity shall be shown on his November, 1924, check or milk statement."

The plan outlined in this report has been adopted by nine of the largest Milwaukee dealers and will become effective January 1st, 1925.

Uncle Ab says that at least two lives are gladdened whenever someone is a bit more generous and more kind than is necessary.

SEWAGE DISPOSAL FOR FARM FOLKS

N. S. FISH, Wisconsin College of Agriculture

WHEN running water is installed in the farm home a sewage disposal plant becomes possible. The septic tank will take care of the drain from the kitchen sink, the bath tub, wash bowl, and toilet. The cost of a sewage disposal system need not be excessive. It can be built by the farmer himself and will give service for many years.

The cesspool and septic tank methods of sewage disposal may be said to be the results of attempts to apply municipal methods of sewage disposal to farm conditions. The septic tank represents in a way a simple municipal sewage disposal plant, while the cesspool remains as the example of a more primitive means of disposing of domestic waste.

Do Not Use a Cesspool

Cesspools still continue to be built. The common cesspool is nothing more than a large hole in the ground loosely walled up with stone or brick laid without mortar so as to allow the liquids to escape into the surrounding soil. The solids settle to the bottom and are more or less completely decomposed. Unless the soil is of loose formation, such as gravel, the solids will choke up the soil and the liquid will not readily leach away. If the soil is of dense formation or hard rock formation, fissures may be encountered, thus allowing the liquid to travel long distances and contaminate a water vein.

The great danger in using a cesspool lies in the fact that by its operation raw sewage is permitted to escape with no purification whatever. Under favorable conditions the cesspool is by no means safe. The fact that a neighbor has used one with no ill effect is no reason why anybody else should use one, as one death from such a source is too much to pay for the needless risk.

Such a means of sewage disposal is but little if any cheaper than the construction of the septic tank.

Septic Tanks

The septic tank at present is the most successful means of sewage disposal adaptable to farm conditions. The tank, as regards both construction and operation, is similar to a municipal sewage disposal plant. It is usually built of concrete or brick; even gasoline barrels have been used successfully.

The theory of sewage purification by means of the septic tank is based on bacterial action. It is a well known fact that sewage kept in a dark, air tight place tends to liquify. Two changes take place in the tank, the first being the settlement of the solids to the bottom and the grease and lighter particles floating to the top. The second is the breaking up of the settled solids. These changes are brought about by minute organisms, known as bacteria, which change the sewage to soluble compounds. The groups of bacteria accomplishing this are known as anaerobic and facultative bacteria. The dissolved organic compounds, if latter brought into contact with an abundance of air, are acted upon by a different class of bacteria known as aerobic, which change the organic compounds into insoluble, harmless, mineral compounds. Both types of bacteria are always present in decaying waste and the group that will act on the sewage depends on the conditions surrounding it. Thus, in an air tight place, as in a septic tank, the anaerobic type will thrive best, while with an abundant supply of air, as in a porous soil, the action is that of the aerobic type.

The method of purification of sewage by means of the septic tank involves both of these actions. The sewage is held in an air tight enclosure until it is liquified. It is then discharged into a tile system laid in a porous soil where it undergoes further purification by the action of aerobic bacteria and becomes nearly pure water.

It has been stated, and many are of the opinion, that when the sewage leaves the septic tank it is 90 per cent pure. This is wrong, as the sewage goes through very little purification in the tank. The function of the tank is to break up the solids. It does not necessarily remove or destroy disease organisms.

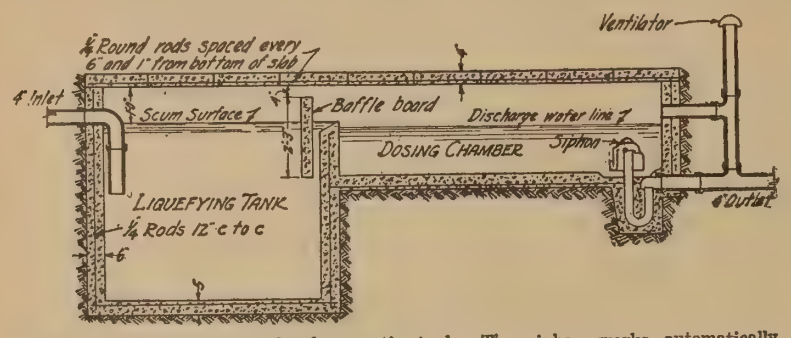

Figure 1. Standard two-chamber septic tank. The siphon works automatically emptying the tank whenever it reaches a certain level. It requires little or no attention. The following table gives the capacities of different sizes of this style of septic tank:

No. of people	Size of Liquifying or Settling Tank: Capacity* Gals.	Inside length Ft.	Inside width Ft.	Depth† Ft.	Size of Dosing Chamber: Capacity Gals.	Inside length Ft.	Inside width Ft.	Drawing depth‡ Inches
4	270	3	3	5	120	4	3	15
6	359	4	3	5	180	6½	3	15
8	493	5½	3	5	240	8½	3	15
10	624	6	3½	5	300	9	3½	15
12	718	6	4	5	360	9'5"	4	15

*Capacity is given for a depth one foot less than specified to allow for sludge and scum. †Below bottom of inlet. ‡Of siphon.

How Built

Figure 1 illustrates a double compartment septic tank. It consists of two distinct chambers separated by a partition and baffle board placed in such a way that the liquid flowing from the first to the second tank disturbs neither the top nor the bottom surface of the liquid in the first tank. In this way a scum forms in the first tank which not only excludes air but also aids bacterial action. The solids are retained and liquified in the first tank so but very little solid material gets to the second compartment. The discharge of the sewage takes place in the second chamber by means of an automatic syphon.

An overflow is provided to carry off the liquid in case the syphon fails to function. This is usually run into the vent pipe located just outside the tank.

By its construction the double compartment tank, with its one deep chamber and one shallow chamber, brings the point of discharge nearer the surface. This is very important on very nearly level ground because it allows the absorption system more fall. The depth of the second compartment can be made deeper and its length lessened if the slope of the land will permit.

On leaving the tank the liquid passes into the absorption system. Between the tank and the absorption system vitrified clay or cast iron pipe with water-tight joints laid with a fall of ⅛-inch per foot or more should be used.

The absorption system consists of a line or lines of four-inch common drain tile laid with open joints in some porous substance as sand, gravel, or cinders. Tarred paper or other suitable material should be placed over the joints to keep out dirt.

The liquid leaks out of the joints between the tile and is immediately absorbed. Further purification is accomplished here by the aerobic bacteria. The intermittent discharge of the liquid by the syphon is necessary for the successful operation of the absorption system. The rest period gives the air a chance to permeate the soil and furnishes oxygen necessary for life of aerobic bacteria.

The Tile Line

The number of tile required is influenced principally by the character of the surrounding soil. Ordinarily 50 feet of tile should be provided for each person in the house. In a soil containing sand or gravel this amount can be reduced.

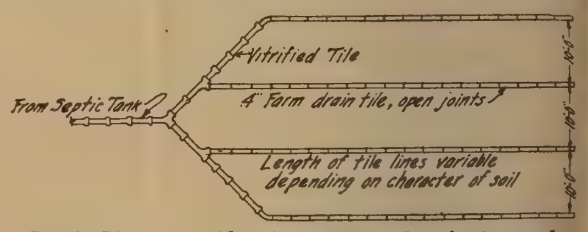

Fig. 3. Plan of an absorption system used on level ground.

The lines of tile should preferably be laid six feet apart with a fall of about 3 inches in 100 feet. The tile works successfully when placed 14 to 20 inches below the surface. No difficulty from freezing will be experienced at this depth.

The location of the absorption system should be at least 100 feet from a well or spring and in such a direction from it that the surface wash and underground seepage are away from the water supply.

Single chamber septic tanks are sometimes used in connection with tile lines.

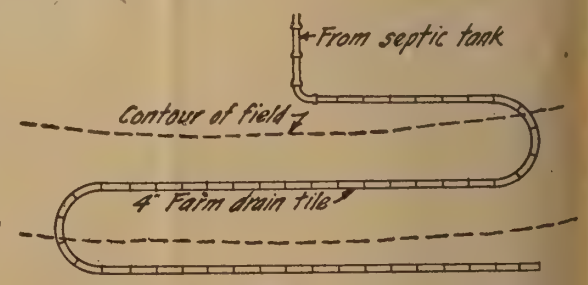

Fig. 4. Plan of an absorption system used on hilly slopes.

Another method of disposing of sewage is that of running it into a stream. This is recognized as a dangerous practice and in most states permission must be obtained from the State Board of Health.

Another method that can quite frequently be used is a single chamber septic tank and a dry well as illustrated in Figure 5. The dry well is built the same as a cesspool but does not render itself liable to clogging in that it does not receive solids. The dry well should not be less than five feet in diameter and should have a depth of six feet or more below the inlet pipe. The dry well should be located where there is no danger of contaminating a water supply, well or spring. The leaching compartment should be 50 feet away from the dwelling or cistern and 150 feet away from a surface well or spring. No abandoned water supply well should be used for a dry well.

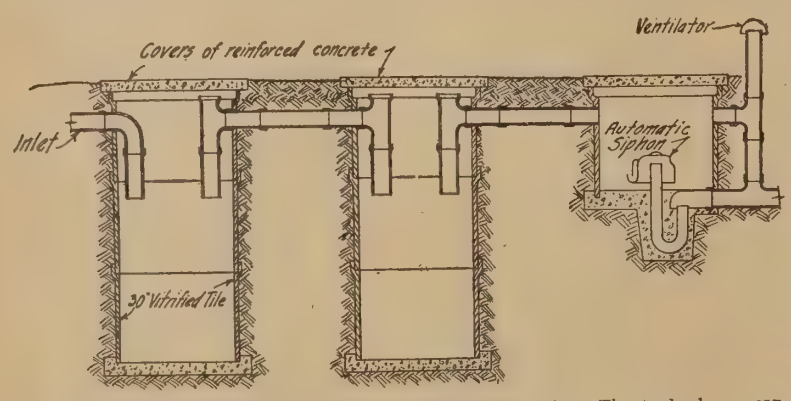

Figure 2. A septic tank constructed of vitrified sewer pipe. The tank shown can be satisfactorily used for a family of 4 to 6 people.

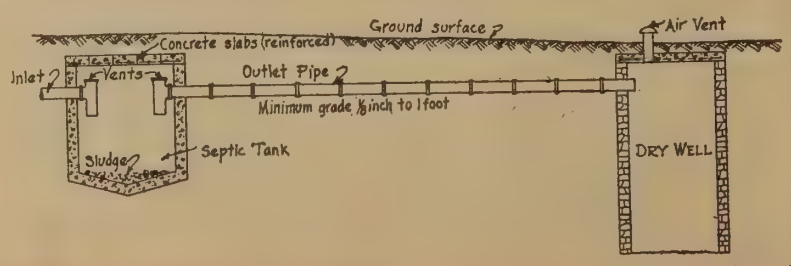

Fig. 5. A sewage disposal system consisting of a single chamber spectic tank and dry well.

BREEDING TO THE BREEDERS

A. C. HEYMAN, OREGON

FOR nearly two centuries breeders have worked to perfect various strains of dairy breeds. Yet the average dairy cow of the United States produces annually less than 160 pounds of fat, and the average of 120 cow testing associations shows an annual production of only 264 pounds fat.

When we compare these records with the work of one breeder, who started with the average of the best pure-breds and developed a family of Jerseys which has increased production 70 per cent in five generations, besides giving to the breed three world record cows, as many as produced by any herd, no matter how large, we ask, "How was it done?"

This was the question I put to Mr. C. C. Dickson of Oregon, owner and manager of the Ashburn Herd, who has accomplished this remarkable record with the progeny of three old proven cows.

"By breeding to the breeders," was his curt reply.

Then he went on to say, "When I left college in 1910 to go into partnership with my father and assume management of the herd, I had a vision of a family of Jerseys which would have five qualities: production, size, vigor, prolificacy, and prepotency, or the power of leaving a uniform lot of high class calves in the herd. I believed that if I could bring about this combination of qualities, and particularly the last, it would only be a matter of time when I could have a large family of high producers which would continue to beget high producers."

These five things appear like a simple ideal I thought, yet I could not comprehend how one could bring about such remarkable results in so short a time. Certainly here was an unusual, wizard-like marshalling of the forces of nature, the understanding of which would reward the most painstaking investigation. I further surmised that this man had not only an ideal but also a definite and speedy method of accomplishing that ideal. So I put the question straight, "Dickson, what do you mean by 'breeding to the breeders?'"

"I mean just this," he replied, "that in order for a cow to remain in our herd, she must not only possess for herself the first four qualities mentioned, but she must have the ability when mated to the right kind of a sire to improve these qualities and pass them on to a uniform offspring. Most females do not possess this ability and owing to the tendency of reversion, their daughters do not average up to the dams. And to us in a breeding way the value of a cow is judged solely by the qualities of her daughters and sons. An animal is either a breeder or is eliminated.

"Even among many of the finest pure-breds there is the constant tendency to reversion. Often an individual of high production and fashionable pedigree is only a cull from a breeding standpoint, as her daughters do not uniformly inherit her qualities. And if she cannot pass her good qualities on with a good degree of sureness, what good is she? Her goodness dies with her and as a breeder she has been of no value. Her daughters are also dangerous to keep as the tendency to reversion may be even stronger."

SILKY HAT AT 18 YEARS

This cow was one of the three foundation cows in the Dickson herd and is a sister of Pearly Exile of St. Lambert, the champion junior 2-year-old. Silky Hat has nine Register of Merit daughters, which is said to be the largest number credited to any cow of any breed.

Becoming more keenly interested, I interrupted and asked, "What do you mean by 'daughters uniformly inheriting her qualities'?"

"Let me illustrate," he said. "Suppose we had two cows, A and B, exactly alike in conformation and production and we rated both at seven points each. Each has four daughters, the average number of daughters of a good cow, as follows:

"Cow A rated at seven points out of a possible ten has four daughters,

A 1 rated at 10 points
A 2 rated at 4 points
A 3 rated at 8 points
A 4 rated at 5 points
Total average, 27 points

"Cow B rated at seven points out of a possible ten has four daughters,

B 1 rated at 8 points
B 2 rated at 7 points
B 3 rated at 7 points
B 4 rated at 8 points
Total 30 points.

"Now, the total points of A's four daughters average 6¾ points, or less than A, and there is a great variation in their value, showing that A is very unstable in passing on her traits. Besides, experience has repeatedly shown that A's best daughter A 1, will probably be as uncertain in passing on her high qualities as her dam. Therefore, *in considering A as a breeder, we pay very little attention to her best daughter and all of our attention to her poorest daughters and the variation between them.* In our opinion A is an undesirable and both she and her daughters are eliminated.

"On the other hand, B's four daughters average 7½ points and are all as good as herself and two of them are better, thus showing that this cow is likely to be free from the 'reversion to type' tendency and tends when properly mated to improve with her offspring. While B's best daughter does not come within two points of A's best daughter, yet one of B's daughters should give birth to a stronger and more uniform line of descendants which will average higher in production than any of A's daughters. With B, therefore, there is an opportunity of improving the breed, and she and her line are kept in the herd."

Continuing his discussion Mr. Dickson said, "The breeder who wishes to improve his herd instead of just raising and selling pedigreed stock must do many things.

"First, he must keep individual production records, not for a year but for a lifetime. We have them for every milking for every cow owned in the last 20 years. These records reveal the true value of a cow and the tendency of the whole family—whether the 'pull' is upward toward improvement, or downward toward ancestral average.

"Second he must be merciless in culling. He is concerned with more than just a world record maker in milk production. If this were his goal, a cow, such as A 1, above illustrated, would reward his ambition. But too often a cow such as A 1 is only a sport which exhibits a decided variation from the normal type, and her offspring, though frequently selling at fabulous prices, are apt to be uncertain breeders. And if this be true, no matter how popular her pedigree or high her record, she is only a cull as a breeder and she should not be allowed to propagate her kind.

"While we have had a great many high producing pure-breds, the cull-

SENIOR AND GRAND CHAMPIONS AT EASTERN STATES EXPOSITION

ATTENDING the Eastern States Exposition at Springfield, Mass., September 14th—20th, was a real pleasure. Situated in the heart of New England and representing, besides the six New England States, New York, New Jersey, Pennsylvania, and Delaware, this annual exposition deservedly enjoys the distinctly individual honor of truly accomplishing its purpose.

For eight years the management has been building up public confidence and the remarkable growth year by year is ample proof of the success of their efforts. Their financial reward is represented by the fact that this year the new Industrial Arts building was opened. Very close to three acres are contained within its walls. It was gratifying to observe that exhibitors used every available inch of space.

FIRST PRIZE AYRSHIRE GET OF SIRE

FIRST PRIZE JERSEY GET OF SIRE

The Springfield show is commonly referred to as the cleanest show in the entire country. No pike or other avenues of side show attractions mar the ground within its gates. Acres of machinery exhibits, a huge building full of the best products manufacturers can make, good horse and automobile races, and a live stock show consisting of dairy and beef cattle, light and heavy horses exceptionally well handled provide interest and pleasure for every walk of life.

Boys' and girls' club work has always received considerable attention at the Eastern States Exposition. We do not know of any similar management that has worked as enthusiastically with the farm boys and girls. More than 75,000 youngsters from the North Atlantic States are constantly trying to represent their own club and state here. Only twelve, six boys and six girls, are accepted from any one state and this makes the competition very close and interesting. Camp Vail, named in honor of Theodore Newton Vail, one of the founders of the exposition and nationally famous for his work in connection with the nation's great telephone and telegraph systems, is the name for the buildings and ground devoted to the junior extension work in agriculture and home economics. This year the poultry club work was featured. One of the reasons for this was the addition of a large poultry show to the exposition's attractions. In another part of "junior territory" nearly 200 boys and girls from dairy calf clubs were located. The condition and appearance of the dairy calves was very praiseworthy and we hope to give more space to this work later.

Dairy Cattle

When we consider the four breeds represented, the 1924 rings were much better than last year from the individual breed standpoint. The Jersey show was the best of the entire year up to date. Frelinghuysen's Twin Oaks herd, probably the best balanced aggregation ever assembled on a fair circuit by any breeder, won a large portion of the money. Elm Hill Farm made a very good showing and won the blue from Twin Oaks in a few classes. Fern's Wexford Noble, the truly wonder bull, won the aged bull class senior and grand championships in his usual easy fashion. He was not carrying the same amount of flesh as in 1923. Counterstroke, a stable mate of the grand champion, was junior champion and reserve grand.

AGED JERSEY COW CLASS AS PLACED BY PROFESSOR YAPP

The aged cow class attracted ringsiders from every breed. Fern's Oxford Diana, a six-year-old matron of Frelinghuysen's, was finally placed at the head of the nineteen aspirants. Ellsworth's Juggler's Jersey Queen, who placed second last year, won the red ribbon again this year. Her foreward attachment and general udder texture did not show up quite as good after the milk-out as the winner. Toffee, a Rockclyffe Farm three-year-old, won the grand championship from Fern's Oxford Diana. The old cow may give her better competition on their next meeting. Fern's Oxford Silver Thread, a Twin Oaks yearling, was junior champion.

New England Holsteins looked better this year. The aged bull class was the outstanding feature of the show, and clearly outclassed the showing at the 1923 National. Fair Oaks Sir Homestead Darkness, showing better than last year, won in his

FIRST PRIZE HOLSTEIN GET OF SIRE

FIRST PRIZE GUERNSEY GET OF SIRE

class and the senior and grand championships for the second time. This class had ten mighty good individuals in it. Hargrove & Arnold's Triune Ormsby Piebe 27th was first prize yearling and junior champion. Last year this son of King Piebe won seven junior championships and he has added five more to his credit this year.

AUCHENBRAIN TOREADOR, SENIOR AND GRAND CHAMPION AYRSHIRE BULL
Owned by Middlesex Meadows Farm, Massachusetts

In the aged Holstein cow class the blue ribbon went to Amos Bridges & Sons on Maggie Ormsby Butter Girl. She is not a big cow but has plenty of character and easily placed over the dry Pinery Farm cow, Kismet Fayne of Valley View. Chesney Scotia Lothian, an Iowa entry, won the white ribbon in this class. Dorothy Ormsby Piebe, Hargrove & Arnold's excellent three-year-old, won the premier female honors and Pearl of Highlawn, a heifer calf belonging to F. P. Knowles, was junior champion.

One hundred seven healthy Ayrshires made a very creditable showing and a considerable improvement over 1923 when the National Dairy Show was the single event most herds pointed for. The aged bull class was not up to the standard we would like to see it as Auchenbrain Toreador had very little competition. This bull, owned by Middlesex Meadows Farm, repeated his 1922 victories by winning the aged bull class and senior and grand championships. The junior champion was the yearling, Strathglass Roamer, owned by Barclay Farms. This young fellow won the blue from a class of eleven and in what was undoubtedly the best male class of the day.

Holehouse Buttercup, a six-year-old from the Alta Crest herd, was the senior and grand champion. Barclay's White Flower, a junior yearling from the Barclay Farm herd, was the junior champion. The class of two-year-old heifers in milk was about as good a class of Ayrshires from the standpoint of type and breed character as has graced an Ayrshire ring this year. Monstone September Morn won this class. She is owned by Monstone Farm and is a daughter of the grand champion bull.

The Guernsey show was not as large as it should have been. A showing of less than ninety Guernseys at the Eastern States Exposition is certainly nothing to be proud of. Competition was not as keen as last year but the type and character of the blue ribbon winners as a whole were very good. Emmadine Farm was very conspicuous when the blue ribbons were tied. There are a large number of breeders with good herds who could well afford to send some of their animals to this exposition and we hope that 1925 will find some of them present.

Shorewood Resolute won the aged bull class, senior and grand championships in an easy manner. He is a rugged bull possessing a good amount of size, breed type, and character. Many will watch him with interest at the National Dairy Show. He is owned by Emmadine Farm. Valiant's King, a calf from the Emmadine herd, won the junior male championship honors. His real dairy type combined with good constitutional indications and clean cut features made him an easy choice for the junior honor.

Mixter May Princess was a very popular grand champion cow. She is an outstanding dairy individual and her general conformation is very pleasing. In judging her and other animals bred at Mixter Farm, Judge Clark called in Gordon Hall and relied entirely on his judgment. Many criticized Mixter May Princess in regard to her size and hind teat placement. These criticisms are just but her superiority over Adell of Burnham Beach in the aged class is apparent, although close. Both cows are owned by Emmadine Farm.

Gayhead's Clematis, a junior yearling heifer owned by George White, won the junior female championship.

BUDDY BOOT

THE *boot illustrated is the Top Notch Buddy, the famous boot with the muscles. If you want a boot that will wear like iron without being heavy or clumsy, ask for the Top Notch Buddy and see that you get it.*

Tested—
for long, hard service

UNDER the hardest possible wearing conditions, test pairs of Top Notch Rubber Footwear are thoroughly tried out. We make sure in advance by *actual service tests* that the construction and workmanship will stand hard knocks. We give them a worse punishment than you ever will.

Then when these test pairs have made good and proved that they will still be giving service when ordinary rubber footwear is worn out, *every single pair* of that particular style or kind of Top Notch Rubbers, boots or arctics, in future, is made with the same exacting care.

All materials—rubber, canvas or linings—have special qualities for toughness, elasticity or appearance. We make each pair by hand from start to finish— the workmanship is never skimped or hurried.

Make sure of *tested service* in your rubber footwear by looking for the Top Notch Cross on the soles. All styles and all sizes for men, women and children—boots, arctics, heavy and light rubbers.

The best stores carry Top Notch Rubber Footwear or will be glad to get it at your request.

BEACON FALLS RUBBER SHOE COMPANY
Makers of Top Notch Rubber and Canvas Rubber Soled Footwear

EDITORIAL COMMENT

It is not uncommon to hear the statement made that when a boy attends an agricultural college he is lost to the farm. This statement is scarcely substantiated by the record of the short course students who have attended the Wisconsin College of Agriculture. Better than 95 per cent of the graduates from the short course return to the farm and become real farmers.

CLEANLINESS FOR THE HOG

It is not uncommon to find swine kept under insanitary conditions. Too often the hog house and yard are the most illy kept of any department of the farm. It seems to be the opinion of some farmers that the hog does not require a clean place to eat or to live and that he will thrive a little better under dirty conditions. The hog is capable of doing fairly well under various conditions, but he does better, the same as all other animals, when his surroundings are kept clean and wholesome. Further, when he is given a chance to be clean, he is quick to accept it. It is a mistake to keep hogs in muddy yards or in unclean pens, or to feed them in places which are dirty.

Many diseases of farm animals can be directly attributed to the kind of care given to their quarters. Not only is disease more likely to break out among herds and flocks when they are kept under insanitary conditions, but invariably there is a waste of feed. Give the hog clean quarters in which to live, provide him a clean place to eat, and give him clean feeds and he will make more profitable gains.

FEED DID IT

Through a better system of feeding, the Minnesota Experiment Station was able to increase the production of a group of cows 36.7 per cent. The records made by these cows on the farm average 4,662 pounds of milk in a year, and at the University Farm of Minnesota, where they were fed a better balanced ration, the production average increased to 6,375 pounds of milk.

We have again and again pointed out the necessity of feeding cows well. There is no wisdom in keeping a large number of dairy cows and feeding them starvation rations. Many demonstrations have been held which show that the average dairy cow of this country is not receiving a sufficient quantity of feed to permit her to do a full day's work. It is false reasoning when the dairy farmer holds that because feeds are high in price and dairy products are not relatively as good in price, it is economical to feed less to his cows. In such instances it is better to sell the poorest producing cows and then feed those that are kept a generous ration.

We do not believe that it is wise at the present time to increase the production of dairy products but that the dairy farmers will do more to help solve their present problem if each one would dispose of a few of his poorest cows and then feed those that they keep better rations. The way to profit on the dairy farm is not through scrimpy feeding but through generous feeding.

A BRAND FOR MINNESOTA BUTTER

Minnesota is noted for the fine quality of butter produced by her co-operative creameries. In national butter contests, this state has carried off most of the honors. There has been a splendid demand for Minnesota co-operative creamery butter and good prices have been paid for it. The farmer who produces the raw material for making butter has profited because the creamery operators have been capable of manufacturing a high quality butter. The state, however, has not profited as it should, for the consumer has not been advised that Minnesota produces a quality product. In the past few months over four hundred Minnesota co-operative creameries have federated themselves into an association and have adopted a name for their butter, which is "Land O' Lakes". Before any butter can be put under this brand, it must score 92 or more. As Mr. A. J. McGuire, general manager of the Minnesota Co-operative Creameries' Association, states, "it is a significant fact that it is the first time in the history of the great farming state of Minnesota that a farm product ever went out of the state under the brand owned by the farmers."

The banners which Minnesota co-operative creameries have won at nationals have been of value to them, but the establishment of a brand will do more to stimulate prices than the winning of banners. Many consumers prefer to buy their products under a brand and are willing to pay higher prices for them. The establishment of a brand is simply meeting the desire of the consumer. It imposes, however, a responsibility, for unless the product is kept to a high quality, the brand will become positively injurious.

MACHINERY AND PROGRESS

A. W. Hopkins of the Wisconsin College of Agriculture says that one of the most striking contrasts which he noted in his travels in Europe is the use of machinery in the United States and the lack of it in Europe. Man power takes the place of machinery there. Methods of handling milk in foreign countries are far different than ours and the milk bottle is apparently unknown. Dairy farmers are rather suspicious of our cow production records and Hopkins found the farmers of Europe not so much interested in how much a cow will produce, as in how profitably she produces. The European dairymen would rather have less milk if it means more profit.

The American farmer should feel happy that so much of his work can be done by machinery and through it he has become the most efficient farmer in the world. Machinery takes the drudgery out of work and makes it a pleasure. The European farmer reasons a good deal like the harvest hand did at the time the self-binder was invented. They reasoned that if self-binders were used there would be no work for them to do. The self-binder has come and hundreds of other kinds of labor saving machinery, and the nation's labor is better employed today than at any time in the history of our country. Not only does it have better wages, more constant employment, but the entire population is living on a standard never equaled by any nation. The more machinery that can be brought into service, the greater progress will this nation make, provided we do not lose sight of the fundamental things in building a nation.

IMPROVEMENT THROUGH BOYS AND GIRLS

Rural school boys and girls in Portage County, Wisconsin, are helping to increase the acreage of alfalfa throughout their section. Farmers in this region have had difficulty in securing good hay crops. Because of the sandy nature of the land, a good clover crop came on the average of once in every four years.

County Agent Noble discovered that alfalfa could be grown successfully. He also put to use the marl beds which are found in certain lake bottoms in Portage County and which are high in lime content. Marl has been called the dairy farmers' white gold and has helped in converting sandy, low producing lands into green fields of alfalfa. Paper mill waste, also high in lime content and comparatively cheap, is being used to advantage by farmers in the vicinity of the mills.

Several alfalfa demonstrations have been conducted by H. R. Noble, county agent, during the past two years and the acreage of 200 is expected to increase more than sevenfold or to about 1,500 acres of standing alfalfa next year.

However, Mr. Noble found that in certain sections of his county there was no better way to demonstrate that alfalfa would grow successfully than to employ the school boys and girls. He secured some Grimm alfalfa seed and inoculated it, then he put up a large number of seed packets. There was enough seed in each packet to plant a small plot of alfalfa. A letter was sent to every rural school teacher in the county requesting a list of boys and girls who would be interested in growing and reporting upon a small plot of alfalfa at home. As a result, some 325 boys and girls in practically every part of the county have made practical demonstrations of alfalfa culture in their community this year. In planting their plots they were advised to lime the soil, using wood ashes, marl, paper mill waste, or some other form of available lime.

Seeing is believing and the demonstration plots of these boys and girls are convincing a large number of farmers in Portage County that alfalfa can be grown successfully on their farms. County Agent Noble employed the same method of seed distribution among the rural school children when furthering the growth of soy beans. The results were very gratifying. Mr. Noble contemplates the distribution of seed corn this way next year.

PROGRESS IN MICHIGAN

It takes men of vision and understanding to render a substantial service to agriculture. Too many of our so-called leaders look for short cuts to lead the dairy farmers of this country to success. There is no such course to be taken in agriculture and Professor O. E. Reed, of the Michigan Agricultural College, fully appreciates this. Michigan has made rapid strides in dairying since Professor Reed was put in charge of the Dairy Department of the Michigan Agricultural College. His program for efficiency in production was started some three years ago and is bearing fruit.

Particular attention has been given to cow testing associations, tuberculosis eradication, pure-bred sires, alfalfa growing, and a crusade against dairymen and farmers using substitutes for dairy products. The first cow testing association in the United States was organized in Michigan in 1906, but only during the past few years have the dairymen really taken an active and widespread interest in such organizations. Three years ago only eleven cow testing associations were in operation but today there are more than 100 associations organized and working. Along with the increased activity in cow testing has come better feeding and a greater interest in growing alfalfa. Five years ago there were only 76,000 acres of alfalfa reported in the state. At the present time there is a total of 500,000 acres in alfalfa exclusive of the 1924 seedings.

The tubercular eradication work has gone forward quite successfully. Seven counties in the state are now listed as Modified Accredited Areas by the Bureau of Animal Industry, five more have completed the second test on all cattle within their borders, while in nine other counties the first test has been completed. Twenty-two other counties have made their appropriations for the test and are on the waiting list.

A campaign is being conducted in the Upper Peninsula of Michigan at the present time to replace the scrub sires with pure-breds. Up to date more than 100 pure-breds have replaced 168 scrub bulls.

The methods used in creating the interest which has brought about these exceptional results are interesting. Dairy and alfalfa campaigns have been made in nearly 40 counties in the state during the past three years. One county is taken at a time. From 80 to 100 meetings are scheduled throughout the county during a period of ten days or two weeks. The meetings are held on certain farms where talks are made in the cow barn or in the field. The farmers from neighboring farms make up the audience and their interest can be judged from the accomplishments which have been made.

This kind of work stimulates the farmer to think and to act. It brings him useful information given under circumstances which are familiar to him and associated with conditions and affairs in which he is directly interested.

Ration With Cowpea Hay

Please give me a balanced ration made up of the following feeds: Plenty of cowpea hay, ground ear corn, ground oats, bran, linseed meal. This feed is for Jerseys producing 5 per cent milk and I expect to feed one pound of feed for each 3 lbs. of milk.

What change is needed when silage is fed?

McLeansboro, Ill. H. J.

When cows are fed a liberal quantity of cowpea hay, it is an easy matter to make a good ration for them. A good mixture to supplement this hay is as follows: Ground ear corn, 400 lbs.; ground oats, 200 lbs.; bran, 200 lbs.; linseed meal, 100 lbs. Feed about one pound of this mixture for each three pounds of milk produced. This ration supplies a very liberal quantity of protein, a little more than is essential for milk production. In view of this, we do not believe it would be necessary to modify the mixture when corn silage is fed. The cows should receive about 25 lbs. silage, or 3 lbs. to each hundred pounds live weight, and this would reduce the amount of hay the animals would eat.

Chickory Blue

About four years ago I bought a farm and chickory blue is scattered all over. Would like to know if any one has had experience as how to get rid of it.

Depauville, N. Y. J. M.

"Chickory is a relatively new weed in New York and, as far as I know, very little has been done toward developing methods for its eradication. I am therefore unable to give you anything very definite regarding the eradication of this weed. If the area which is infested is quite extensive probably the best manner of attacking this weed is to put the land into a cultivated crop for at least two years. During this time the crop should be cultivated frequently and any chickory plants that are not destroyed by cultivation should be removed by hand hoeing. This treatment, done thoroughly, should do much toward eradicating the chickory. Land which cannot be cultivated can be pastured closely with sheep. This will tend to kill out the chickory, but not as effectively as cultivation."

The above information was given us by Professor W. C. Muenscher of the Cornell College of Agriculture. Have any of our readers had experience with "chickory blue" and its eradication?

Cost of Cottage Cheese

If a creamery pays 50 cents a pound for butterfat how much will a can of 40 quarts of 40 per cent cream cost?

If skimmilk is made into cottage cheese and sold for 4 cents a pound, how much can a creamery afford to pay for the skim?

Naticoke, Pa. J. R. S.

Forty per cent cream will weigh approximately 8.28 lbs. to the gallon, and ten gallons (40 quarts) would contain 33.12 lbs. butterfat. At 50 cents a pound, this butterfat would cost $16.56. The more accurate method would be to weigh the cream rather than to estimate its weight by measure. Also, cream will seldom test exactly an even per cent fat, and there will be a slight variation in test from day to day even under the best conditions.

The cost of manufacturing cottage cheese is influenced largely by the volume of business. The U. S. Department of Agriculture estimated that a few years ago the cost of manufacture would be approximately one dollar a thousand pounds skimmilk on the handling of 40,000 to 70,000 lbs. skimmilk each month. The cost is figured on the basis of pounds milk because of the variation in the yield of cheese. Figured on the basis of a yield of 16 lbs. cheese to 100 lbs. milk, the cost of manufacture would be a trifle over six-tenths of a cent a pound. This does not include the cost of the package in which sold, the selling cost, or the cream which may be added; it merely covers the cost of the cheese delivered from the vat. If a larger volume of milk is handled the cost would be reduced, while an increase in cost would occur with a smaller volume. When only a small quantity of cheese is made, the regular creamery force could do the work without additional labor cost. This would reduce the cost of manufacture by 50 to 75 per cent, as labor is the important factor.

If we were to assume that the cost of manufacturing cottage cheese, including package, selling, and losses, was a cent a pound and the yield was 16 lbs. per hundred pounds skimmilk, the creamery might be able to pay 48 cents a hundred for skimmilk. It is quite probable, however, that even were the wholesale price to remain stationary, there would be times when the output could not be sold and the resulting losses would bring the cost of that actually sold to over a cent a pound.

Why Sweet Clover Pasture Failed

HOARD'S DAIRYMAN:—On page 171 of Hoard's Dairyman was shown a sweet clover pasture of 26 acres that, after furnishing pasture for 29 cows for seven weeks, was eaten close to the ground and had practically stopped growing. The theory was advanced that it was because it was yellow sweet clover in place of white sweet clover.

We have a field of white sweet clover which was pastured this summer. On part of the field the clover has disappearad almost completely long ago. On the other part which was given a coat of manure last winter, some clover is still growing. The reason in this case was the cold, backward season. If cattle could have been removed for awhile and the clover given a chance, the results would probably have been different. Next season we have a five-acre field to use as an alternate if the probabilities are for a recurrence of the past inclement season.

Wisconsin. A. L. GREENGO.

Cheat in Rye

I am sending you under separate cover a small sample of grass that grows with rye very nicely which I do not know the name of. Maybe you do. I have tried it out and it is not objectionable. At present I have three cows which are eating the second crop of grass and I have threshed out some of the rye and I feed some of it with the fleshy green stuff and they seem to like it.

Oxford, N. Y. E. P. B.

The grasses included with the rye in the package sent me are specimens of bromus secalinus, commonly called cheat or chess. It grows very often in fields of winter grain, such as rye or winter wheat, when the land is not fully occupied by the crop. You will remember that this has led, in times past, to farmers believing that the witches turned their wheat to cheat. That I think is where it gets its name. It is troublesome in the winter grain because it is difficult to remove entirely by cleaning. It shatters badly also and if the crop gets ripe it may re-seed itself so that it stays in the land for a long time. It is an annual. If it can be kept from seeding it will soon kill out. Thoroughly cleaned seed grain, the full occupation of the land by the grain crop, and cutting before the cheat ripens is the proper method of eradication. ANDREW BOSS.

Minnesota Experiment Station.

Alfalfa—Straw Sandwich

Somewhere I read that late cuttings of leguminous hays that would be difficult to cure properly have been stacked green in alternate layers with clean straw. Hay staked in this manner came out in a yellow or brownish color but with leaves intact and was relished by stock.

Can you please tell me whether or not it would be an economical undertaking here in the East where an abundance of clean straw is available? Is there record of it having been tried with results? Could it not be used as a substitute for alfalfa for test cows where the latter is prohibitive in price?

Lenox, Mass. R. W. R.

What you refer to by alternating layers of green alfalfa or clover and clean straw, is what has been known sometime back as the alfalfa-straw sandwich. This subject was under discussion six or seven years ago and reports from various places, where this plan had been tried out, were quite favorable. However, the practice has not become general in any sense of the word. It seems to have originated in Oregon. We have not had any experience in trying out this method of handling hay, but I am of the opinion that it would prove a rather inconvenient and expensive way of endeavoring to cure alfalfa. We have had, and are having here in the Middle West, a great deal of fall and summer rain, making it exceedingly difficult to cure alfalfa. This moisture, together with the low temperatures, results in the hay lying in the swath for two days or more without any very appreciable drying. These conditions are rather discouraging but, where alfalfa is stacked outside, I think it can be stored while in a rather green condition with the prospect of getting very good hay.

I noticed recently my brother hauling in alfalfa hay to the stack which was so green that it caused difficulty with the side delivery and hay loader. Rest assured that this hay was not moist with any external water from rain or dew. It had been rained on but the external moisture was completely dried off. This appears to be very important because it seems as if the external moisture causes severe molding and dangerous heating. There is no question but that this green hay will heat in the stack and when it is taken out next winter it will be for the most part brown in color and will have a pleasant aroma which evidently gives it a remarkable palatability. There is no question but that the feeding value of this hay is reduced by the extreme heating process but this loss may well be made up for in the improved palatability of the hay.

I doubt very much that the alfalfa-straw sandwich plan of handling rather green alfalfa hay will tend to increase the feeding value and palatability of the straw sufficiently to secure any noteworthy results in feeding the straw portion of this sandwich. I suppose if one would pour molasses on straw it would be readily eaten by cattle. The molasses itself would have some feeding value, but the straw would be very low in feed even with this treatment. There is not a great deal of information available on this plan of storing alternate layers of alfalfa hay and straw. The reason for this is the fact that generally this plan is not practical. Usually, the third crop of alfalfa is cut and cured in the field without a great deal of difficulty. Very often, straw is not available on the farm until after the third crop of alfalfa has been cut. Furthermore, late fall cutting of alfalfa and clovers is harmful from the standpoint of their permanence. Alfalfa, especially, needs a fall growth of eight or ten inches to withstand the winter weather.

Milking the Reluctant Cow by Machine

I see different things about milking machines, but I never saw anything like I would like to know. In Aug. 29th issue it tells about milking machine teat cups. Now I have a milking machine with rubber lined teat cups and it works fine, but I have four cows in a herd of 20 head that hold their milk by machine milking. Is there any way to get the milk by milking machine from those cows that hold their milk? I would like to find out. These cows are all easy milkers and we get their milk easy when milking by hand, and have tried a few ways to get it but didn't succeed. We're using our machine since March and at first we didn't have trouble with our cows. It just started a few weeks ago.

Wisconsin. J. J. D.

This correspondent is directing his question at the heart of the whole milking machine problem. "Is there any way to get the milk by machine milking from those cows that hold their milk?"

There is no way by which this milk can be forced from the cow. It may be coaxed by kindness, but if the cow wills to hold up the milk, no machine can extract it and no human being can extract it by milking by hand. This is one principle that many do not understand, and this is one reason why some milking machines are not operated successfully.

The correspondent says that his cows are all easy milkers. This condition may contribute to the involved difficulty. The chances are that time is not given for the cows to give down their milk fully before the machine is put in operation. If the machine is thus put in operation on the cow that milks easy, the machine will draw the milk faster than the milk is given down. On this account the suction or vacuum is applied directly on the tissue of the internal parts of the cow's udder, instead of directly on the milk. When this happens, most cows are sensitive and under such conditions refuse to give down their milk. This condition is more likely to come about with easy milkers than it is with cows that milk rather hard

The correspondent further states that when the machine was first used in the month of March, no difficulty of this kind was experienced. This was undoubtedly due to the fact that the cows were then heavy milkers. They gave down their milk fully and quickly. Now when pastures are short, flies are troublesome, and the period of lactation has advanced considerably, the same cows produce less milk. There are many cows which are very slow to give down their milk when milked by hand under such conditions, and they have to be coaxed considerably. Cows giving a small quantity of milk should be coaxed to give down their milk before the machine is attached. If the milker knows the cow, he can easily ascertain this by the warmth and condition of the cow's udder. If the milking machine is attached to a cow that gives a very small quantity of milk before the milk is given down, then the difficulty of holding up the milk may result. C. LARSEN.

UNION CARBIDE

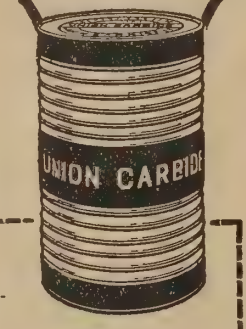
makes washday a holiday

FIRST the water-heating. The Carbide-gas water heater delivers hot water a few minutes after it is lighted.

Then for cooking on washday. Time is valuable and much of it is saved by the convenience of a Carbide-gas stove.

And finally for ironing. The Carbide-gas iron saves many steps and minutes, by making it unnecessary to change irons. It insures better ironing because it maintains an even temperature.

Thus Union Carbide gas makes washday's tasks lighter, and when evening comes wives and daughters are not too tired to sit under the Carbide-gas light in the living-room, and sew or read.



Union Carbide itself is a manufactured crystalline material, in general appearance like crushed granite. Dropped into water, it immediately produces Carbide gas. This contact with water is made in a simple, easily understood, automatic apparatus known as a generator. From the generator the Carbide gas is piped throughout house, porches, barns and poultry buildings, by means of concealed iron pipes.

Highest insurance authorities rate Union Carbide-gas lighting safer than the illuminants it replaces.

More than 409,000 plants using Carbide gas for lighting and cooking have been installed in the past 25 years.

Interesting booklets are ready for you. Send for them today.

UNION CARBIDE
Always packed in blue and gray drums
Highest Gas Yield.
Always Uniform.
Purest Gas.
Dependable Supply.
Union Carbide in generator sizes is sold by us direct to consumer at factory prices through more than 150 Union Carbide Warehouses. There is one near you.

SPEED BOTTLE WASHERS FILLERS
DESIGNED RIGHT PRICED LOW
FOR SMALL DAIRIES

Under Water Washers. Two brushes clean bottles inside and out. Use with electricity, gas engine or hand crank. Little water necessary.

Fills 12 bottles a minute. Puts exactly right amount in every bottle. Cannot overflow. No bubbles. No topping up. Fills all size bottles without adjustment. Very easy to clean.

Fastest small dairy machines ever built. Wonderful time savers. Direct factory prices in reach of all. Free trial. Easy payments. Write for full details.

THE DANA CO., Dept. H, Platteville, Wis.

Kalamazoo
ENSILAGE CUTTER

The features that have made the **Kalamazoo the World's Standard Cutter,** will make it a profitable investment for you. It is safe, sturdy, fast, and unfailingly reliable.

Lifetime, channel-steel frame;
Unbreakable knife wheel;
Centre shear cut;
Triple feed rollers that insure steady feeding:
Reversible shear bar;
Absence of vibration;
Rigid guarantee

Clean, Fast Cutting

This smooth, easy-running, non-clog blower will get your silage in at the right time and at low cost. One lever starts or stops it. Three sizes to meet every farmer's need. Special terms now. Write today for Ensilage Cutter Book and full particulars.

Canadian Dairy Notes

F. E. ELLIS, ONTARIO

THE biggest new thing in Canadian dairying is the attempt now being made to form a province wide dairy pool in Alberta. Last year the three prairie provinces of Canada, with a wheat crop of approximately 500,000,000 bushels to market, each attempted to form a wheat pool to handle the crop for the producers. The attempt was successful only in Alberta. Not only did the pool handle a large part of the wheat crop but the net price to the producers, just announced, is several cents a bushel higher than was realized by those growers who sold through the regular channels of trade. Probably the success of the wheat pool last year has encouraged dairy farmers to attempt a dairy pool this year. The proposal first came before a meeting of the Alberta Dairymen's Association but was voted down, principally, it is said, through the opposition of the manufacturing interests which were largely represented. The project was not dropped, however, and on August 1 a meeting of representative dairymen was called at Red Deer and the subject discussed from all angles. At this meeting it was unanimously decided to appoint a provincial board "for the purpose of organizing a provincial pool for the marketing of dairy products on the contract plan." A provisional board of seven members was appointed.

The promoters of the proposed pool recognize the complexity of the problems involved, with the frequently conflicting interests of the city and factory producers. It was also recognized that the province has an advantage for pool marketing in that the surplus over home requirements is made almost altogether into butter and that this butter is all sold on distant markets. Almost from the inception of the movement there has been a difference of opinion as to how contracts should be drafted. The representatives of the unorganized districts favor a direct method of contract between the producer and the central selling agency, while those representing districts in which local co-operative pools are already in operation, usually centering around a co-operative creamery, are unwilling to give up a local plan already tried for a central control as yet untried. It is the old problem of central versus federated control of co-operative organization. It is probable that the final documents drawn will provide for a direct contract with the producers of unorganized districts and a cross contract between the central organization and the local pools that will bring about close, province-wide co-operation and still maintain the entity of existing machinery that has been built up locally.

At time of writing, this is as far as the pool has progressed. The people of the West have a way of acting quickly, however, and the pool may be in operation in a comparatively short time. Such a move would have little hope of success in the older dairy districts of eastern Canada without months, and perhaps years, of consideration. The cheese pool that was attempted in Ontario a year ago was a failure. But the West is not afraid of new methods.

⚜

The fall fairs are again with us and the feature of the creamery butter sections of all the exhibitions of first importance is the sweep that western Canada creameries are making of awards. This has been true for several years past and we are getting accustomed to seeing a lot of prize money going to the west of the Great Lakes. Take Toronto as an example: At this fair over 75 per cent of all prize money in the creamery sections was won by prairie creameries. One first place went to a Nova Scotia creamery, Ontario got six minor placings, including a third, while the provinces of Manitoba, Saskatchewan, and Alberta captured 29 of the 36 regular prizes and all the specials. Why are the prairie creameries so successful year after year?

Primarily, prairie quality is a matter of economic necessity. The prairies have a large surplus of butter that has to be marketed in competition with the world. They started to make good butter only when New Zealand competition drove an inferior product off the British Columbia market. Now they have to compete with both New Zealand and Denmark on the British market. As a start toward improved quality, government butter grading, on a voluntary plan, was adopted. Then operators of creameries started to pay farmers for cream according to its grade. This resulted in a wonderful improvement in the raw product. The three provinces are now the largest block of territory in the world that buy cream and sell butter entirely according to government grades. As a result of paying both the farmer and the buttermaker for superior quality, the West now commands a strong position for its butter on international markets and carloads are shipped regularly to the most discriminating United States markets. It is a great triumph for grading. Creamerymen in Ontario, on the other hand, have a domestic market that takes practically all their output, a market that has become accustomed to the grade of butter that has been manufactured in the past, and they are not under the necessity of maintaining expert quality. When such quality is required, it will be produced.

⚜

The county herd plan has had its first try-out at Canadian fairs this fall. At our large fairs, as in the United States, the showing in all dairy breeds has been practically monopolized by breeders with large herds and considerable means. The small breeder of limited means has found it more and more difficult to remain in the running with methods of fitting and showing ever becoming more expensive. The county herd plan, the equivalent of the state herds at the National Dairy Show, seems to be an antidote to this condition. County effort can bring out representatives of herds that would never get beyond the local show otherwise. At Toronto there were county herds in the Guernsey, Ayrshire, Jersey, and Holstein breeds with prizes for each of $100, $75, and $50. At least 20 new exhibitors were out as a result. Each herd consisted of six animals, not more than two from any one herd. At the Ottawa fair the plan was used more extensively and in Holsteins alone 25 new exhibitors were brought into the ring. The big breeders have co-operated in this movement and, in not a few cases, the extra entries from their counties were taken to the fairs and showed by them in the name of the owners.

⚜

Prices have been anything but satisfactory to producers the past summer. In May and June cheese factories were paying as low as 98c a hundred pounds for the milk of average test. The powder factories were

only a few cents in advance of this; in fact, when the feeding value of the whey is taken into consideration, the cheese factories had the advantage. In July and August the markets improved and $1.35 and up was paid at factories whose cheese graded well. At time of writing the cheese market is not as strong as it was. Powder factories are paying $1.40 and up for 3.5% milk. Practically all city producers had to take heavy cuts in summer prices. The Toronto distributers paid as little as $1.33 a cwt. at country shipping points in June and $1.48 in July. Last winter the price was over $2 a cwt. Creameries in Ontario are now paying 34 cents per pound fat and the price has ranged from 30 to 33 cents all summer. These prices are but little in advance of pre-war levels.

Danish Dairy Advance

Receipts for Danish dairy products during 1923 were considerably greater than during any previous year and demonstrates again that the dairy industry is the most important industry in the country, states American Consul General Marion Letcher in a report received in the Department of Commerce. The number of cows increased during the year by about 38,000 over the 1922 number. At the close of 1923 there were 1,349,000 milk cows in Denmark, including Southern Jutland, which was acquired by Denmark in 1920. It is evident that, compared with pre-war conditions, Denmark has not as many milk cows as in 1914.

In addition to domestic feedstuffs used in the dairy industry, Denmark imported large quantities of fodder cake meals. The imports of oil cakes amounted to 1,270,000,000 pounds compared with 860,000,000 pounds in 1922. The imports of oil cake meal and wheat bran increased as well.

Both the winter and summer milk production was unusually large in 1923 and the quality of milk supplied by the various dairies was, generally speaking, very good. The quality of Danish butter was also very satisfactory and it can be said safely that Danish butter has continued to improve from year to year, due in large measure to tests and exhibitions.

There was considerable increase in Denmark's butter exports and 1923 showed the largest exports in the history of the dairy industry. The following table shows the countries which purchased Danish butter.

Exports of Butter. (In Casks and Boxes)

	1921	1922	1923
Germany	1,200,000	513,230	3,413,400
Great Britain	135,176,000	147,680,000	203,284,600
Norway	8,092,000	6,734,600	5,306,700
Sweden	9,144,000	1,265,000	300,700
Belgium	7,423,500	16,027,400	4,052,500
France	9,943,200	13,828,300	3,091,300
Holland	1,712,500	253,300	175,700
Switzerland	17,020,000	12,487,500	9,037,300
U. S.	11,340,000	2,753,700	8,620,200
Czechoslovakia		6,225,300	5,336,000

The Danish cheese industry experienced a better year in 1923 than in 1922. The entire domestic production in 1923 was estimated at about 60,000,000 to 75,000,000 pounds or about the same as in 1922. The cheese export was not, however, as large as in 1922, but the domestic consumption was much greater.

The complete report on the Danish dairy industry in 1923 may be had upon application to the Foodstuffs Division, U. S. Department of Commerce, Washington, D. C.

I find the great thing is this world is not so much where we stand as in what direction we are moving.—O. W. HOLMES.

CHEVROLET

Indicating Chevrolet Quality

Power!

Power to speed over the steepest hills—to pull through the most difficult roads. Endurance that gives dependable, trouble-free performance and long life. Economy—the greatest in any automobile engine.

These are outstanding characteristics of Chevrolet's famous valve-in-head motor.

The Chevrolet power plant includes a modern 3-speed sliding-gear transmission with hand lever, Remy electric starter, generator and ignition—water pump to insure perfect cooling, and oil pump for efficient lubrication. The fuel is fed by a modern vacuum feed system.

This is the type of construction found on cars far above Chevrolet in price and it is a fair indication of the quality to be found in a Chevrolet car throughout.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Kimble Comes Back

HOARD'S DAIRYMAN:—Mr. R. T. S. of Illinois, in criticising my article regarding solutions for the farmer's problem, does not attack the main points of discussion but merely questions some of the argument which I offered in support of my statement that our government is committed to paternalism. Whether he chooses to call the rate section of the present transportation act a guarantee of profit or not will not in any way affect the truth of my statement that we are so committed as a nation. We have the Adamson law for labor, the Federal Reserve Act for the bankers, the Cummins-Esch Transportation Act for the railroads, as well as different tariff acts for the manufacturers. I take the position that we are therefore entitled to a real farm act for the farmers.

My statements regarding the reclamation of western lands was made to show middle western farmers and farm interests generally that we of the Middle West are not exactly the whole agricultural world to be considered and that we are destined to be a great export nation for an indeterminate number of years. I did not advocate any present extension of land reclamation and the unsalable nature of irrigation bonds during the past 10 years has entirely shut down any new work in that field.

My plan for solving the farmer's problem and for bringing immediate relief to all whose interests center in agriculture was published in Hoard's Dairyman last spring and in three other farm journals. It has been in the hands of congressmen during last session of congress and parts of it were used in forming the proposed agricultural bills.

It is in the cost of production that the great difficulty arises in dealing with the farm problem. The greatest single factor in determining production costs is beyond control of man.

Real farm legislation must recognize this as the outstanding fact to be met. There have been thousands of industrial experts who have advocated carrying their pet industrial schemes and systems into the farming field. They all fail for lack of proper consideration of the above mentioned fact, that is, the cost of production cannot be told within 100 per cent prior to harvest. The much boomed dairy industry corresponds more closely to other industries than do other lines of farming because it is to a greater extent a turnover proposition in which the profits are found in the margin between feed cost and market value of products. It is to that extent a mercantile venture.

It is very unfortunate that all men don't see the farming problem alike and there is much danger in drawing conclusions based on a section of this country rather than all of it.

Minnesota. HOWARD KIMBLE.

False Reasoning

HOARD'S DAIRYMAN:—I have read with interest the communication by James H. Birchard in your recent O. B. & B. columns. It seems strange how much false reasoning we have in these times. He states that school children, when given milk, have done better in their studies, and from this he reasons that their parents have not had sufficient funds for buying them the food they need to nourish them properly. This man forgets that there is quite as high a percentage of undernourished children among the rich people as among the poor. It isn't a question of dollars. It is a question of information regarding the proper diet for growing boys and girls.

He then complains regarding the number of dollars we earn a day and the amount that we get back. It seems to me that there is no way of determining just how much we earn. This can be said, that we are living in the most prosperous nation in the world and I am sometimes led to believe that we find more fault with our conditions than with any other nation in the world. It would seem that about all there is to American life is fault finding.

I read in the papers that carpenters are getting $1.25 an hour, plasterers $1.50, and bricklayers about the same. If these people aren't getting a share of the wealth, who is? If they can't buy milk for their children, what's the matter with them?

What has freight got to do with over-supply or under-supply of food? It seems to me that in some respects high freight rates are a good thing. They teach communities to raise the material that they need or at least those things which can be raised. It has become the habit of many consumers to send long distances for their food products when in their own community these same products could be raised and the farmers would be better off if they would diversify. The South, for instance, buys millions of dollars worth of canned goods from the North. If the freight rates were so high that it couldn't afford to buy them, it would raise these food products. The leaders recognize this and are putting on compaigns to get the farmers of the South to raise the products they consume.

It seems to me it is the height of foolishness to blame all our difficulties on the railroads when without them we could not have our present civilization. The wages of railroad men have been doubled the past fifteen years and freight rates are only about 50 per cent higher. No railroad system in the world carries freight so cheap per ton per mile as those in the United States.

To say that we haven't an overproduction is to ignore facts. If we would have had less wheat, less hogs, less beef, and less of many other products, the farmers would be getting a fair price for their farm products.

To intimate that the laborer is unable to buy sufficient food to fill his stomach and those of his children, is ridiculous, for they have money to buy automobiles, attend moving picture shows, and dress in the height of style.

Minnesota. R. D.

A doctor was called in to see a negro who was down with influenza.

"What's I gwine to gib him?" asked the wife.

"Give him whiskey," the physician responded.

"How much do it cost?"

When the doctor named the price of good whiskey per quart the wife remarked:

"I can bury him cheaper dan dat."
—Everybody's Mazagine.

Feed Did It

That cash returns from ordinary grade dairy cows can be tremendously increased by feeding better home grown rations has been demonstrated by the dairy husbandry division of the University of Minnesota.

One year ago the division purchased four grade cows from a member of a cow testing association. Records had been kept of the feed consumed and the milk and fat produced in two years by each cow. The cows had received good care but had not been fed a suitable ration.

The original owner pastured the cows six months of the year and fed a winter ration of 23 pounds of timothy hay each day per cow and a grain mixture composed of bran, middlings, Molo Feed, and oil meal, five pounds to each cow daily. All materials in the mixture were purchased. Going on test at University Farm in October, 1923, the cows were fed a home grown ration only, consisting of corn silage and alfalfa hay for roughage, and oats, corn, and barley mixed for grain. The pasture period was five months.

On the original owner's farm the average milk produced per cow was 4,662 pounds in a year. The university men by feeding a home grown protein ration increased production to 6,375 pounds or 36.7 per cent. The average fat per cow was raised from 182 pounds to 259 pounds or 42.3 per cent. The value of production per cow increased from $87.36 to $124.32 or 42.3 per cent. The average cost of the university ration was $61.42 per cow each year as against the average feed bill of the original owner of $49.46, but the university's system of feeding brought returns over feed cost per cow of $62.90 as against the original owner's return of $37.90, a gain of 60 per cent. The experiment with the cows will be conducted at University Farm another year.—Minnesota College of Agriculture.

Russian Butter Exports

According to latest reliable estimates in Riga, butter exports from Russia in the present season will amount to about 52,580,000 pounds against about 15,190,000 pounds in 1923, states American Trade Commissioner C. J. Mayer in a report received in the Department of Commerce. Of the four principal Russian dairy organizations exporting butter at the present time (Selskosoyuz, Chlieboprodukt, Sibtorg and Centrosoyuz), Selskosoyuz is doing the largest business. This organization has contracted with a British concern, against an advance of 50,000 pounds sterling, to furnish at least 5,840,000 pounds of butter this season. Its total export for 1924, it is estimated, will amount to 15,190,000 to 16,000,000 pounds, principally to England, but also some to Esthonia and other countries. Sibtorg is expected to export from 8,760,000 to 9,000,000 pounds, and more than half of this has been contracted for by an English firm. The butter business of Chliebroprodukt is practically entirely handled by a Danish-British concern. This organization expects to export from 11,685,000 to 14,000,000 pounds of butter during the current season.

Skillful Shooting

Officer (to recruit): Goodness gracious! Man, where are all your shots going? Every one has missed the target.

Soldier (nervously): I don't know, sir. They left here all right.—Everybody's Magazine.

SMOOTH PERFORMANCE

A program of constant mechanical refinement involving the body, engine, clutch, brakes and other units of Dodge Brothers Motor Car, has resulted in an unusual smoothness of performance.

You have only to ride in the car to instantly appreciate the decided freedom from vibration.

The Value of a Sire

Just to have a pure-bred sire heading a herd isn't enough. It should be a good sire. Some figures, recently received from Rock River Farm, Illinois, well illustrate the value of such a sire. They have there at the head of their herd of registered Holsteins the bull, Sir Johanna Fayne Segis Pontiac. The records of his first five daughters to be tested and of their dams are shown in the accompanying table.

The records were all made on the same farm so they make a very fair comparison.

	Age	Milk lbs.	Fat lbs.
Dams			
K. S. P. Bessie	4-11-0	16025.3	518.33
Nettie Leola De Kol	5-10-15	17339.7	493.86
Berta Pontiac Ormsby Lass	3- 2-8	12821.4	432.25
McCormick Burke Pontiac Zulu	2- -17	12049.3	383.74
Nagawicka De Kol 5th	5- 2-22	16225.0	602.56
	19-33-63	74460.7	2430.74
Average	4- 4-18	14892.1	486.17
Daughters			
Johanna Pontiac Bessie Fayne	2-10-4	20985.8	689.02
Leola De Kol Fayne	2- 8-18	19381.9	737.77
Johanna Berta Ormsby Lass	3- 1-14	21543.8	763.20
R. R. Johanna Burke Zulu	2- 5-15	18450.4	599.42
R. R. Johanna Nagawicka De Kol	2- 1-28	17989.7	617.57
	11-25-79	98351.6	3406.98
Average	2- 7-27	19670.3	681.41

Increase over dams—Milk, 32 per cent; butter, 40 per cent.

"What is a 'wooden wedding', Jack? Do you know?" Mary said.

"Of course!" her brother replied. "It's two Poles getting wed!"—Good Hardware.

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Write for free sample bottle. Wells & Richardson Co., Burlington, Vt.

BERNARD H. RAWL

IT becomes our sad duty to announce the death of B. H. Rawl who for more than twenty years devoted himself to the development of the dairy industry of the United States. He was born at Lexington, S. C., May 2, 1876; was graduated from Clemson College in 1900, instructor in animal husbandry and dairying at the Clemson Agricultural College from 1902 to 1905; in charge of dairy farming investigations, U. S. Dairy Division, 1905 to 1909; Chief of U. S. Dairy Division from 1909 to 1921 and from 1918 to 1921 he was also assistant chief of the U. S. Bureau of Animal Industry. For the past three years he has been assistant manager of the Golden State Milk Products Co. of San Francisco, Calif. His untimely death occurred at Berkeley, Calif., September 23rd, and he will be buried at Petersburg, Va.

B. H. RAWL

In the twenty-four years which elapsed from the time of his graduation from college to that of his death, Mr. Rawl devoted twenty-one years in state and federal service and only a little over three years to commercial work. He was admirably adapted to public work, for he had a keen understanding of the things which should be done to help develop the dairy industry and he had a high sense of justice as to what the consumer was entitled to receive from the producer. It was his belief that the producer should have a fair compensation for his product and that the consumer was entitled to a wholesome, well prepared product. Not only did Mr. Rawl understand the various subjects which should be investigated, but he had the faculty of picking men capable of carrying out the experiments which he instituted as Chief of the U. S. Dairy Division.

He came to the Dairy Division for the purpose of carrying on dairy farm investigational work and this he did with distinction to himself which lead to his appointment as Chief of the Division. In this position he established many investigations and he lived to see some of them carried to the point of being commercially valuable.

Sweet cream butter was one of the first experiments to which he directed his attention and in the past few years this product has become a large factor in the butter market. It promises to be still larger. He selected scientists to direct their attention to the study of improved methods of manufacturing both Swiss and Roquefort cheeses. Splendid progress has been made in perfecting the processes of manufacturing these two kinds of cheeses.

He was not satisfied with the laboratory results in experimenting in sweet cream butter and Roquefort and Swiss cheeses, but he saw the necessity of establishing an institution where all these products could be made on a large scale and under conditions similar to those under which creameries and cheese factories must operate. A plant of this character was established some years ago at Grove City, Pa., and from that time to this investigations have been conducted to improve the processes in the manufacture of both butter and cheese.

Mr. Rawl was not content to devote himself only to the problems of manufacturing dairy products and improving the quality of milk, but was instrumental in establishing a farm where various experiments in the field, in feeding cattle, and in breeding have been inaugurated. Perhaps the best and most extensive experiment pertains to breeding. Many years will elapse before any definite conclusions can be drawn from this experiment, but he has laid a foundation which will in time unfold more knowledge regarding the principles of breeding.

We cannot relate here in detail all the work Mr. Rawl did, but it can be said that with his broad conception of the dairy industry, its needs, and his ability to choose men to serve under him, he has laid a firm foundation upon which will be carried on investigations that will contribute bountifully and generously to its welfare. He never lost interest in the progress and work of the U. S. Dairy Division and devoted himself, with his friends and associates, to getting it raised to a Bureau of Dairying. It was his deep conviction that the dairy industry was of sufficient magnitude and importance to deserve a larger representation in the U. S. Department of Agriculture than was afforded by a Division.

Back of his success was a sincere desire to do right and to render an honest service to humanity. He had the confidence and support of the leading dairymen and dairy scientists of the country. This was gained through hard work, loyal and capable service. One of his fine traits of character was expressed in his strong desire to see young men succeed and he gave much of his time in helping those who served under him.

Though his life was short, he lived long enough to make a worthy and lasting contribution to the development of the dairy industry. He gave the best that was in him and he was faithful in all things and to all men.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

WASHINGTON, D. C., SEPT. 23—The concentration of attention by the national organization of manufacturers of oleomargarine on the referendum to be held Election Day in Washington and Oregon on the oleomargarine laws enacted in those states last year indicates how dangerous to oleomargarine—that is, how satisfactory to dairy interests those laws are.

The general purport of the Washington and the Oregon laws are to require oleomargarine manufacturers to make their product without mixing in any milk or butter. That is, the meat in the coconut which has stirred up the whole national oleomargarine industry. Such a law prevents making oleomargarine to smell or taste like butter. They may mix water with it to give it the amount of moisture which it absorbs from the milk, when milk is used, but water does not give it the dairy flavor. Just what would happen should they try to use lactic acid has not been seriously considered.

⚜

The production of oleomargarine in the United States, as indicated by the taxes paid, increased for the fiscal year ending June 30, 1924, over the previous year sufficiently to swell the taxes from $507,707 to $570,605 for colored oleomargarine; and from $678,890 to $918,318 for uncolored. There is also an increase of about $186,000 in the taxes paid by manufacturers and dealers.

⚜

A change is announced in the Washington office of the American Farm Bureau Federation caused by the resignation of Grey Silver, to take full time charge of the work of the Grain Marketing Company organized recently in Chicago, of which he has been elected president. Mr Silver will spend some time in Washington and has been named by the Farm Bureau as "Counselor" to the Washington representative. His former assistant, Edwy B. Reid, has been named as Washington representative. Mr. Reid was formerly chief of the Division of Publications of the U. S. Department of Agriculture.

Raising Dairy Calves on a Large Scale

A. WETTACH, IOWA

RAISING dairy calves that go into the herd of over 200 cows on the Fairfield Dairy's large farm is the work of Miss Ruth Francisco of New Jersey. For a number of years she has been doing this and has always had from 20 to 50 small calves that she was pail feeding.

This calf herd is on the home grounds about a half mile from the dairy barns. Here they have their barns and pastures. The calves are penned according to size and age. This is a help in feeding them and it is a precaution against the spread of disease as well. After the calves are six months old they are sent to pasture 20 miles away in the foot hills. Here they are kept through the summer and brought back to the dairy barns for the winter.

Miss Francisco is an expert herdswoman and has made records with her pure-bred Guernsey cows on official test. She is very enthusiastic about her work of managing the calves and her small herd of Guernseys. The success of calf raising depends on the caretaker and Miss Francisco certainly has a herd to be proud of.

The calves are nearly all high-grade Guernseys and Holsteins. A few pure-breds of both breeds are included. Since all of the milk produced on this farm is retailed in the near-by cities, the combination of Guernsey-Holstein milk is an ideal product. Only the best heifers are raised.

The demand for milk at a good price makes it out of the question to raise the calves on whole milk. Consequently the calves are taken from the cows when but a few days old. They are taught to drink without much trouble at this age. For several days the young calves are fed three times a day and any weak ones, four times.

Miss Francisco feeds each calf individually. The weaker and younger get more attention and are fed according to their strength and size. Rules will not always hold in feeding dairy calves—judgment, not rules, is her policy. There is more danger from overfeeding than underfeeding she believes. Some calves at a month require more than others several weeks older.

With such a large herd to feed there is a limit to the milk supply. All of the skimmilk and fresh milk from the dairy is brought out at each feeding. A milk can of hot water is also part of the feed. Both the water and milk are previously boiled by live steam.

From the time the calves are three weeks old they are fed on skimmilk substitutes. The few pure-breds are the exception and they get skimmilk until they are four or five months old. Miss Francisco feeds the Purdue Mixture of equal parts by weight of hominy feed, red dog flour, linseed oil meal, and blood meal in the form of a gruel. Corn meal will take the place of hominy meal. She mixes a small quantity at a time, enough for a feeding, and stirs in cold water to make a thick paste. Warm water is added to this at the rate of 4½ quarts to the pound of dry meal. The gruel is substituted in the calf milk, pound for pound of skimmilk until a complete change is made, which takes about a week. The calves get the gruel until they are five or six months old. Twenty pounds a day is the maximum amount any of them get.

The calves have access to grain and hay from the time they are ten days old. Miss Francisco feeds a mixture of corn meal, ground oats, and bran —frequently adding a little oil meal and salt. The hay is in a rack to keep them from wasting any by tramping.

From five to ten calves are staked out on the large lawn during the summer and moved each day. They are kept in at night; fed in the morning and taken out; and turned loose at feeding time in the evening. There is a grand rush for the barn as the calves are untied and the buckets are waiting for them as they reach their pens.

Water is a part of the feed and the calves are usually watered at noon unless the days are very hot. In such cases they are given a moderate amount in the morning and afternoon. Too much in the heat of the day may cause bad results.

Miss Francisco believes in accuracy in feeding her calves. The feed is all weighed or measured and the milk and substitutes are fed warm—95° being the temperature. Until she became accustomed to feeding the gruel and milk at this temperature she used a thermometer. Never does she feed a calf sour or cold milk—better to skip a feed and run no risk of scouring the calf.

Scouring is one of the worst and most common of calf ailments. Much of it can be prevented by sanitation, which is Miss Francisco's strong point. The calf buckets are scalded after each feeding and sunned during the day. The pens are kept clean and dry, and, if scouring does occur, it is usually from some other cause. Her recommendation for a calf that scours is to cut its feed in half and give it a dose of four tablespoons of castor oil in the milk. A weak calf should not get a feed cut, —give it an egg or four drops of formalin to each quart of liquid. "Every sickness is a setback. Keep them growing," is her advice.

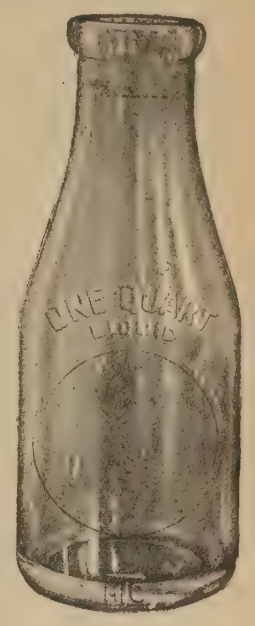
The success of calf raising, especially on a large scale, depends on the caretaker, Miss Francisco believes, and she has been successful in raising several hundred dairy calves.

ALDEBARAN ANNABELLE

A record recently completed at the University of Wisconsin makes the heifer, Aldebaran Annabelle, a member of the University herd, the Ayrshire state champion senior two-year-old in the 300-day division. Her record is 11,546 pounds milk and 461.89 pounds fat.—R. S. HULCE, Wisconsin.

"Well, Sandy," said the laird, "you are getting very bent. Why don't you stand up straight like me, man?"

"Eh, man, do ye see that field o' corn over there?"



"I do," returned the laird.

"A' weel, ye'll notice that the full heads hang down, and the empty ones stand up."

$3344.62 Received for milk
1077.93 Cost of feed
$2266.69 Return over feed cost

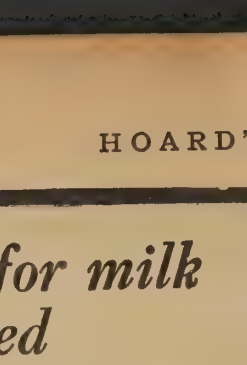
These figures are taken from the record books of Inslee Bros., Windy Brow Farm, Newton, New Jersey.

The first amount is exactly what the Inslee Brothers received for 112,644 lbs. of milk produced by their Grade Cow No. 14 over a period of 10 years. The second amount represents the cost of feeding this one cow. The third is what cow No. 14 made for the Inslee Brothers over the cost of feeding.

Ten years ago this Holstein, on her first lactation, was being fed

Buffalo Corn Gluten Feed

as the protein basis of her grain ration. Today she is still being fed BUFFALO. Throughout this ten-year period BUFFALO formed the bulk of her ration's protein at practically all times.



THE dairyman who wants heavy and consistent production of milk over long stretches of time without injuring in the least the health of his cows, should keep this 10-year record in mind. The cow who made it is an ordinary, good grade cow, such as you have in your own herd. What she has done your cows can do on the same good feeding.

Start today to feed BUFFALO in your ration—a pound of it to 2½ lbs. of other feeds. Keep records of milk receipts and feed bills. In about six months the figures will have a story for you that will tie you up to BUFFALO for life.

Association Notes by Testers

Bitter Root Valley, Mont.: One member completed his milk room equipment last month by installing a steam boiler and washing vat. One separator which was losing $20 was adjusted so that it is now losing less than $5. In August the cheese factory paid 34 cents per pound for fat, the creamery 37 cents. Milk retailed for 10 cents per quart.—R. Gaalaas.

Floyd County No. 1, Iowa: Few improvements have been made during August due to the busy season. Threshing is now nearly completed showing a very good grain crop. Ten farmers fed grain and the average production per cow of these ten herds was 34.5 lbs. fat compared with the average of 19.4 lbs. fat of the other 16 herds. The high herd consisting of 11 grade Holsteins, owned by J. Binger, produced an average of 37.2 lbs. fat. Market milk sold in August for $2.25 per cwt. The condensery paid $1.70, the ice cream plant $2.25. Milk retailed at 10 cents per quart.—J. B. Day.

Davenport, Iowa: August was unusually cool and pastures good, consequently production has not dropped much this month. Grain is high and all patrons are feeding it except five. Corn is $1.10 per bushel, oats 45 cents, bran $28.00 per ton, oil meal $45.00. Feed cost of producing 100 lbs. milk was 83 cents and 19 cents for one pound butterfat. Market milk sold for $2.20 per cwt. in August and retailed for 11 cents per quart.—T. E. Hotchkiss.

St. Joseph County, Indiana: A registered Guernsey two-year-old heifer, owned by John Roush, made 1,003 lbs. milk, 55.1 lbs. fat in August. Market milk sold for $2.65 per cwt. in August and retailed for 12 cents per quart.—E. E. Weiss.

Clark—Scott, Ind.: Nine herds averaged over 31 lbs. fat last month. Guy Daily had the high herd of 39.6 lbs. fat for 7 pure-bred Jerseys. The average of the 345 cows tested in this association was 539 lbs. milk, 27.6 lbs. fat; average feed cost $4.44; average profit, $8.46. Market milk sold for $2.39 per cwt. last month and retailed for 12 cents per quart. Fat brought 36 cents per pound in sour cream and 41 cents in sweet cream.—W. W. Barnett.

West Hamilton County, Ind.: Two separators were checked and found to be running at a loss. The condensery paid $1.70 per cwt. for 4 per cent milk, the creamery $2.00 in August.—T. D. Barclay.

Delta County, Mich.: In the county-wide T. B. eradication campaign being carried on in this county, four more association herds were tested last month. One herd was found clean. Three reactors were found and disposed of.—C. R. Olson.

Monroe County, Mich.: Most dairymen in this association send milk to the Detroit and Melrose creameries. The milk market is very dull at present. The creameries are giving the producers a heavy surplus. Market milk sold for $2.70 per cwt. in August. The creamery paid $1.85 per cwt. for milk. Milk retailed at 10 to 12 cents per quart.—L. A. Dexter.

Huron—Ubly, Mich.: Seven separators were tested. Two members started to weigh milk and ten fed grain on pasture. A fly spray mixture was made by the tester and distributed to the members. Market milk sold for $1.60 per cwt. in August. The creamery paid 37 to 40 cents per pound for fat.—C. M. Wagner.

North Allegan, Mich.: A total of 292 cows, 47 being dry, were tested last month. Bert Ter Haar's herd of 18 Holsteins, including one dry cow, was high for both milk and fat production, having an average of 1,217 lbs. milk, 44.4 lbs. fat. Owing to the exceedingly high price of grain during August, eleven out of 27 members did not feed grain with pasture. Those who did feed grain with pasture realized an average of $1.81 more per cow above feed cost than those who did not feed grain, even with pasture better than it has been for years. One faulty separator was found. Market milk sold for $2.00 to $2.60 per cwt. last month.—C. L. Fleming.

Spring Green, Wis.: Since the reorganization of this association in March, six herds have been tuberculin tested and no reactors found. Cheese factories in this section paid $1.45 per cwt. for milk and 42c per pound for fat in August.—A. F. Clump.

Central Monroe, Wis.: Many members are feeding minerals. One member seeded 8 acres to sweet clover for pasture. The creamery paid 44c per pound for fat last month.—V. Sorenson.

Mt. Hope—Lancaster, Wis.: A cow testing association exhibit being shown at the county fair features one high and one comparatively low producer. Twelve members fed grain to cows on pasture. In August the cheese factory paid 34 to 40 cents per pound for fat; the creamery 40c. Milk retailed for 10c per quart.—B. J. Paulson.

Medford, Wis.: The average production of 313 cows which finished a full year's work in this association was 6,343 lbs. milk, 250.2 lbs. fat. One hundred seven cows produced over 300 lbs. fat. Otto Lueck has highest producer for the year. His Holstein cow produced 13,371 lbs. milk, 501.2 lbs. fat. Wm. Nihiba has the highest herd record for the year of 9,832 lbs. milk, 388.6 lbs. fat.—N. Hansen.

Centre Co., Pa.: During the past year there were 21 members in this association with 291 cows, the average return per cow was 6,257 lbs. milk, 244.6 lbs. fat. The high cow, a registered Holstein owned by J. J. Markle, has a year's production of 10,616 lbs. milk, 523 lbs. fat. The highest producing herd, with an average of 9.58 cows, owned by A. C. Hartle & Bros., produced an average of 10,447 lbs. milk, 344.2 lbs. fat. A close second in average fat production was the herd owned by W. E. Weight. This herd with 12.67 cows

produced an average of 9,263 lbs. milk, 344 lbs. fat. Williard Straw was the tester.—I. O. Sidelmann.

July Testing in Virginia

During July there were thirteen active cow testing associations with 246 herds and 6,064 cows reported on test. Of this total 489 cows produced over 40 lbs. butterfat, and 125 over 50 lbs. of butterfat.

The high cow for the month was Aris Pietje Burke Lass, a 6-year-old pure-bred Holstein that freshened April 26, 1924, owned by Miniborya Farm, a member of the Henrico Association. Her record for the month was 2,373 lbs. of milk and 80.6 lbs. of butterfat. Of the ten high cows six were pure-bred or grade Holsteins, three were pure-bred or grade Guernseys, and one was a grade Jersey.

The high herd for the month was the herd of ten pure-bred Holsteins owned by H. L. Butler and Sons, members of the Culpeper Association. This herd averaged 969 lbs. of milk and 38.3 lbs. of butterfat. Of the ten high herds, six were Holsteins, three were Jerseys, and one was a Guernsey herd.

The average production of all cows, including 694 dry cows, was 574 lbs. of milk and 23.3 lbs. of butterfat. The Orange County Association had the highest production in both milk and butterfat. The 487 cows in this association, including 26 dry cows, averaged 620 lbs. of milk and 26.5 lbs. of butterfat.

There was considerable decrease in the average production of all cows, in the production of the high herds, and the number of Honor Roll cows for the month. This was largely due to the fact that a very large number of the association cows in this state freshen in the fall, and are starting to dry off. Pastures are also getting short and dry in most sections of the state.

There were 57 cows sold during the month as unprofitable. Five pure-bred bulls and nine pure-bred cows were bought during the month.—L. P. Emerick.

Another Year's Work

HOARD'S DAIRYMAN:—During the past year in the Plover, Wis., C. T. A., 415 cows were tested in 33 herds, 13 cows produced over 400 pounds of butterfat, 106 over 300 pounds, 32 cows in Register of Production, and 11 herds averaged over 300 pounds fat. The association average for 33 herds is 6,837 pounds milk and 265.6 pounds fat.

Josie, a grade Holstein owned by Oley R. Wincentsen, takes high cow honors; her production is 11,633 pounds milk and 444.7 pounds fat.

Russell Archer takes herd honors with his herd of eight grade Holsteins that averaged 8,549 pounds milk and 354.1 pounds fat.

Fifteen herds were T. B. tested and 12 reactors were found. Seven members installed drinking cups, ten barns whitewashed, five silos built, four members use milking machines, four pure-bred sires bought, six members grow alfalfa.

A. G. ELBERT, Tester.

Minnesota Has Forty Associations

The following data is obtained from the report of E. A. Hansen, supervisor of cow testing associations in Minnesota:

Out of 40 associations in operation, 29 submitted an annual report for the year ending December 31, 1923. There were 32 new associations formed during the year, and five associations failed to reorganize.

Of the 9,568 cows on whom a report was secured, 8.5% were disposed of as unprofitable. Pure-bred sires were in use in 97% of the herds. Silage was fed by 86% of the members and legume hay was fed by 59%.

The average production of 9,568 cows was 6,637 lbs. milk, testing 3.89% fat and containing 258.7 lbs. fat. The average cost of feed was $42.27, leaving a profit over feed cost of $82.13.

High herd consists 20 pure-bred and grade Holsteins owned by Ed. Oliver that averaged 15,700 lbs. milk containing 530 lbs. fat. Highest producing grade cow was also in the Oliver herd and she had a record of 17,314 lbs. milk containing 612 lbs. fat. The highest pure-bred cow (also on A. R. test) was a Brown Swiss owned by F. P. Minnette and Son. Her record was 25,848 lbs. milk containing 1,002.6 lbs. fat.

A Pennsylvania Association

The York Valley, Pennsylvania, Association finished the year with 23 members and 371 cows. The average production per cow was 8,344 lbs. milk and 314 lbs. fat. There were 42 cows producing over 400 lbs. fat, first place being taken by a registered Holstein, owned by H. E. Robertson, that produced 22,323 lbs. milk and 706.3 lbs. fat. Twelve herds averaged over 300 pounds fat, the Robertson herd of 14 pure-bred Holsteins heading the list with an average of 13,309 lbs. milk and 449.7 lbs. fat.

When you choose a car, buy

POWER — The automatically lubricated Buick Valve-in-Head six-cylinder engine is recognized the world over as the most powerful type of engine that has ever been developed.

COMFORT — The Buick spring suspension, low-pressure tires and even balance provide a comfort that has yet to be surpassed.

BEAUTY — A single glance at any Buick is sure to show its extraordinary grace and power. Closer inspection reveals that this beauty goes through and through. Upholstery, interior appointments and body finish are conspicuous examples.

SAFETY — The greater safety of Buick four-wheel brakes goes without saying. The mechanical perfection that characterizes Buick's braking system provides a driving safety that is endorsed by motorists everywhere.

SERVICE — Wherever you may travel, Buick authorized service is close at hand. This service is on a flat-rate basis and according to rigid Buick factory standards.

Buick has them all!

THE CIRCUIT RIDER

Experiences of a Kansas Cow Tester

J. C. WALLACE, KANSAS

I HAVE been a cow tester. How matter of fact, prosiac, and simple that sounds! And so I thought the life and duties of a cow tester to be when I engaged in that occupation some six months ago. It all sounded easy enough as outlined to me—just a few straightforward tasks and duties—I was to operate the Babcock test, keep cost of production records on bovine matrons of doubtful disposition and pedigree in some twenty herds or more—also to give members of the association advice regarding matters of feeding, breeding, and sundry other details related to the operation of a dairy farm. These duties were all fully outlined by a member of the extension department, a supposedly honorable and competent man. It has since occurred to me that the thing he was most expert in was keeping the rosy side of things uppermost and in withholding some of the details of life before a prospective cow tester.

Of course the expert told me no deliberate falsehoods, but there is a deceit which puts the veriest falsehood to pale shame; I refer to the omission of certain details—and in that art the expert had no peer.

The duties he outlined to me I have performed, but only in an automatic sort of way. My concentrated thought is wrestling with more entertaining and gymnastical feats of grey matter. Yet, verily, I wonder if that extension specialist has ever blushed in the seclusion of his chamber at the multitude of "minor" details which he so thoughtlessly omitted when he imparted his instructions to me—for listen, if you will, to an incomplete and meager list of the details he forgot to mention.

I spend my evenings adding milk sheets while the daughter of the house plays the piano and sings her favorite songs. I figure rations while I hear the long, sorrowful tale of the awfulness of the neighbor's children. I write in herd books while Mrs. chats long and uninterruptedly over the party line. Often I am obliged to keep the baby's teething ring in place and watch the beans from boiling over.

I tutor high school pupils in English and algebra; I write chemistry equations and pronounce such words for them as xprhynax and zrnxhyhr, etc., and next month on my return am greeted with reproaches: "Say, you worked all of my problems wrong!" "Teacher said that theme you corrected and rewrote for me had twenty-four errors in it!" And I am supposed to look sad and repentent and strive to do better next time.

I try to keep the family posted on fashions at least once a month. If I fail to be able to tell Mrs. Swenson how much Mrs. McGuire's fall hat cost, I am frowned upon and given a small piece of pie for supper.

I have taken care of the baby and criticized the herd sire all in the same half hour. Many a weary mile have I walked to see the promising young heifer just bought. I have developed a set speech for all such occasions, as well as for the member who tells me what a wonderful cow old Brindle is and how I am not seeing her at her best.

I know the first name of every lad's sweetheart and I always ask the boys how things are. I know when to ask daughter how she ever found such a wonderful new hat and frock. I know which ones like to sit on the back porch in the evenings and I am never partial to any, no matter how lovely or homely they are.

I learn one new joke each month and relate it to each member. I am a walking dictionary of harmless gossip. I carry more family secrets than a private detective, a village gossip, or a telephone girl, but I must keep them locked in my breast or I would be hanged before morning while all of the members of the association smiled.

I have taken invalids riding in my Ford and given sick chickens castor oil, prescribed for ill critters of all sorts, and tried to be happily on my way before they died. I have given much advice of doubtful volume on subjects that I have never heard of because it seemed that I was expected to know. I have chosen wall paper and the color of paint for the house.

I am supposed to sleep but five hours each night because I come only once a month and the folks like to entertain me till eleven or twelve o'clock, but they always milk at four A. M. I have slept in a poor house because the farmer next door had no spare bed.

I am as welcome to the housewife as the smallpox, and all of the hired men cuss me. I can't even snore at night without being told about it and once a hired man kept me up all night to tell me his affairs of heart.

I realize that I have been woefully inefficient. My education lacks breadth and variety. I need more versatility. Outside of my dairy courses I have no background whatever for my various problems. I have often longed for a course in "Interior Decorations" or "Home Beautification". So handy to a cow tester to have little points like that to call to his aid now and then.

If a cow tester is to realize his full opportunities for service there is no question that he should be a graduate veterinarian, while a first class mechanic's certificate would be advantageous also. If he is not a born diplomat and reader of human nature, it would be best to make an exhaustive study of psychology. Courses in "Landscape Gardening" and "Clothing and Textiles" would not be amiss. A course in a barber's college would be a stroke of genius for a prospective tester—so often it is hard for a dairyman to get to a barber shop. Add to these a few courses, degrees, and arts, the patience of Job, and an indefatigable body and mind and you will make an excellent cow tester.

To digress a bit, and in conclusion I will say that a tester's life is not a soft one or a snap as perhaps the reader may guess from the few points mentioned above. Nevertheless it has its real and lasting compensations—the friendships gained and the contacts made I would not trade for money or wealth untold. One meets real men and real women among his members. Their worth and the value I place upon their regard have repaid many times the insignificant tribulations of my daily tasks.

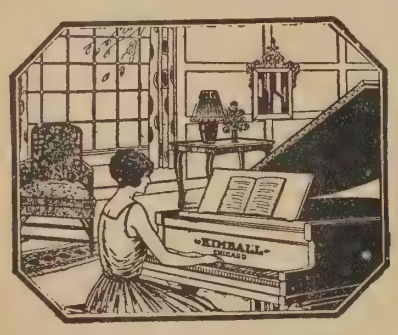
When you visit a home once a month for, say, a year it is surprising how much interest and solicitude for the well being of that little group is aroused in you. The most interesting part of my work was not testing, but people; and I do believe that there are just a few more honest to goodness folks among cow testing association members than any group of people of a like number that can be found. Altogether the tester's job is a most fascinating employment and there is nothing more exhilarating.

Milk Record Sheets

For years Hoard's Dairyman has been preaching the necessity of keeping records of the production of each cow. Only by knowing how much milk each cow actually gives is the dairy farmer able to improve his herd. Our Book Department has various sizes of milk record sheets to make it easy to keep tab on your cows. Complete samples with price list will be sent for 5 cents in stamps. Address Hoard's Dairyman, Fort Atkinson, Wis.

BOB'S ELDERON MABEL

Guernsey class leader in CC with 816 9 lbs. fat from 16,952.3 lbs. milk. She was bred by Matt Domaszek & Sons of Wisconsin in whose herd part of the record was made. She is now owned by Larsen's Fern Dell Farms of Wisconsin.



KIMBALL

for those who demand the Best

THE KIMBALL is *made* in the State of Illinois but is *sold* in every State in the Union and in many foreign countries.

The reliability of the Kimball House dates back to 1857—a continuous record of 67 years in the music industry.

Kimball Grand, Upright, Reproducing, and Player Pianos, Pipe Organs and Phonographs are *made*—not merely assembled—in the Kimball Factories, Chicago.

The Award from the World's Columbian Exposition of 1893 was granted for "superlative merit" and "highest standard of excellence." And this has been confirmed by highest awards from our greatest international expositions of 1898, 1909 and 1915.

Prices of Kimball instruments are reasonable—unquestionably the greatest value for the money.

There is variety of designs—a Kimball to suit every home.

Now for those long-delayed IMPROVEMENTS

If this new 48-page farm book cannot be obtained from your local building supply dealer, write our nearest address for a free copy.

Now for those long-needed improvements on your farm. Now for permanent structures where, through these past lean years, temporary structures have had to serve. Such improvements are tangible assets in securing a loan. They are permanent, fire-safe and repair-proof.

Today, success in farming calls for the application of modern business methods. Competition, if nothing else, makes this imperative. If the men employed on your farm—busy during harvest—should stand idle this fall and winter, you would lose money.

Valuable crops, the product of your labor and investment, must be safely stored, if they are to be marketed at a time when they will bring the highest prices.

Now, when you can most profitably devote time to the improvement of your property, you will need this new Lehigh Cement book—"Concrete Suggestions for the Farm". This 48-page book contains the latest and most simplified methods of constructing Silos, Barns, Poultry Houses, Dairy Houses, Ice Houses, Storage Cellars and other buildings—also complete information on mixing and making concrete, with special suggestions on Winter Concreting.

Get this valuable book, free, from your building supply dealer who displays the blue-and-white Lehigh sign.

The Lehigh dealer is a reliable man from whom to get practical advice on all building problems.

In all concrete work you do, you will find Lehigh, the Portland Cement, to be relied upon for quality and uniformity.

Don't store hard-won crops under leaky roofs—

Look to your roofs now—before winter rains and snows come storming across your fields. Poor thrift, isn't it, to leave expensive implements and hard-won crops stored under leaky roofs? Just as surely it's sound thrift to make every building on the farm tight and dry against the attacks of winter weather.

Replace worn-out old roofs with roofs that last — Barrett Roofs. Sixty-six years of experience have taught The Barrett Company how to make roofings that are staunchly durable.

Barrett Roofings meet every requirement of a good roof:

(1) Lastingly weathertight. No rot — no rust.

(2) Soundly economical, they're low in first cost — lowest in cost per-year-of-service.

(3) Free from maintenance expense — they need no painting or staining.

(4) Highly fire-resistant, they're a sure safeguard against flying sparks and embers. This is doubly important to the man living far from a good fire department.

Call on the nearest Barrett dealer. Ask to see Barrett Roofings. (Leading lumber, building supply and hardware merchants carry them.) There's a Barrett Roofing that's definitely right for any building on your farm.

Barrett ROOFINGS

Your Choice of Six Styles

Everlastic Smooth-Surfaced Roofing

A roll roofing of best grade roofing felt, saturated with high grade waterproofing material. Made in medium and heavy weights. Tough, pliable, elastic, durable, low in price, and easy to lay.

Everlastic Mineral-Surfaced Roofing

A beautiful and enduring roll roofing. Mineral-surfaced in red, green, or blue-black. Popular for cottages, garages, farm buildings.

Everlastic Giant Shingles

Handsome enough for the expensive home, economical enough for small farm house or cottage. Mineral-surfaced in beautiful shades of red, green, or blue-black, with extra-thick, extra-rigid base. Size 12" x 14".

Everlastic Single Shingles

Identical in shape with Giant Shingles but not quite as heavy. Mineral-surfaced in same beautiful colors. Need no painting, are fire-resisting.

Everlastic Multi-Shingles

Four shingles to a strip. Mineral-surfaced in red, green, or blue-black. Two sizes—10 or 12½ inches deep, both 32 inches long, providing two or three-ply roof when laid 4 inches to weather.

Everlastic Octagonal Strip Shingles

The newest mineral-surfaced strip shingle. Colors: red, green, or blue-black. Can be laid in novel designs by interchanging red strips with green, or red strips with blue-black.

New York's Banker-Farmer Conference

H. H. LYON, NEW YORK

CO-OPERATIVE work is well at the head in agricultural affairs. Banker-Farmer conferences are held in all sections and one was held in late August at the Cornell college of agriculture. Dr. C. E. Ladd was in charge and suggested that the financing question in relation to farming is one of the biggest problems that we have.

D. H. Otis, director of the agricultural commission of the American bankers' association, reported that bankers favor diversified farming and he selected Kansas and Wisconsin to illustrate his point. Wisconsin is better diversified and the farmers are receiving much more. Mr. Otis argues that Kansas needs many more products and Wisconsin some more, and it is the idea of the Commission to encourage such effort and among other things Kansas should have more cows. In Wisconsin it is suggested that more legumes are needed and banks are expected to encourage the diversification suggested for each locality in the country.

As a whole the Commission would favor further development of boys' and girls' clubs with further assistance from bankers. Second, they favor more diversifications; third, closer relation of bankers with farmers, with bankers to furnish credit rather than storekeepers. This he thinks will result favorably to both farmers and storekeepers. In the fourth place they favor federal appropriations for more investigation and research work in state experiment stations.

Fruit Packers' Problems

Fruit packers of western New York are having their own problems in relation to co-operation. C. S. Wilson explained one of these associations which he regards as an average. Twenty growers agreed to start and each to invest five hundred dollars. They found that they could buy a building and necessary outfit for $13,000. This necessitated a mortgage on the property of three thousand. Several of the members could not supply the cash and had to give notes, thus necessitating farther credit at the start. Soon barrels and supplies must be purchased and paid for. To get additional credit at the bank each member gave a note for five hundred dollars to be used as collateral.

Large volume of business is essential so thirty such associations federated, hired a manager, and pooled their product. Many growers needed money. At first thirty cents a barrel was advanced but later this was increased to two dollars. To get the money, warehouse receipts were used and credit obtained on them.

Mr. Wilson finds that in grading the apples there were found to be 141 varieties and three, four, or five grades of each variety. It will at once be seen what a big job developed to keep all these separate and return to each grower his proper share of the proceeds. Bank credit was essential all the way along and should there be any better methods of obtaining it they would be worth while.

Financing the Dairymen's League

The method of financing the Dairymen's League was explained by the vice-president, John D. Miller. He also explained the organization. It is a membership association with member control through directors as provided in the law. The second feature is that of principal and agent, with a contract between them, the association being the agent. This contract is frequently mentioned as the pooling contract. Mr. Miller suggests that it may be because that word does not appear in it anywhere. In the third place there is the idea of creditor and debtor, the association being the debtor.

Handling milk is somewhat different from other products because of its daily supply, its perishability, and especially because of the surplus at times necessitating manufacture. Forty per cent of it all is produced in three months' time.

There is no stock in the League, it being a membership co-operative with one vote for each member. There are no profits and any money that might in other corporations become a surplus or reserve goes back to the member in the thirteenth check. Approximate returns are made every month to members, care being taken not to allow this amount to exceed the real return for the month. Occasionally large stocks of evaporated milk are accumulated and a part of their value is returned to the producers by borrowing from this reserve fund. In case the evaporated milk sells for more than is estimated this fund is increased by the transaction, or if it sells for less the fund is of course diminished.

Then Mr. Miller explained briefly how deductions are made from members' checks as a loan for capital purposes. The first year's deductions amounted to approximately 4.3 million dollars and the second to 4.6 million. Since then the deductions have been much less, or about 2.5 millions. At present the association is engaged in buying up a certain amount of the earlier issue at a five per cent discount, that being sufficient to care for the cost of handling. The purpose of this is to bring all the yearly issues to practically the some amount when they fall due. It has not been found necessary to make use of bank credit thus far in League operations.

The Wool Pool

The state wool pool, as it is called, amounts to a business of about a quarter of a million dollars. F. E. Robertson is in charge and he rendered a report at the conference. Thirty-eight counties are in the association, these county associations being members of the state federation. The wool is sent to the warehouse in Syracuse, it is identified and graded, there being frequently six or seven grades in a single flock. May, June, and July are especially low months and but little wool is offered by the association before September first. It is then offered usually to mills, not to speculators. Financial problems are not great as advance payments are not commonly made to producers.

The important expenses are freights, insurance, labor, bookkeeping and selling. A small amount of warehouse receipts is used to pay these expenses and to pay a few men who feel that they must have the money, but most of the wool is free for shipment at any time. It would be possible to borrow up to half the value of the wool. Interest is charged the producer on advance payments to the extent of its cost to the association.

The G. L. F. Exchange

H. E. Babcock brought out very well the need of establishing the G. L. F. Exchange. It was impossible before to get the needed quality of seed and

seed dealers were making much money blending cheaper foreign seed which would not stand our climate. Fertilizer manufacturers were using filler to the amount of one-fifth to one-half. Now it is easy to get 16 units of plant food, since the public formulas of the Exchange have been published. The same story is found in the matter of dairy feeds. Quality is now available but Mr. Babcock feels that the Exchange needs to go on. He advises that it is costing all dealers too much to get orders and this is even true in the case of the Exchange. Members should do more to reduce this cost.

In discussions, one speaker objected to a co-operative like the G. L. F. operating unless it maintained a constant supply throughout the year as do the dealers. It is not fair to the local dealer. Another thought it best to allow the local dealer a chance to handle the co-operative goods and if refused them there can be no objection to car door and intermittent service.

I omitted one important statement to the effect that all co-operatives should make intelligible statements once a year or oftener. Another statement was that people observe the failures much more than the successes and say more about them.

Poor Keepers of Cows

HOARD'S DAIRYMAN:—Dairymen fail, as a rule, who do not realize that to be successful they must understand maternity. Further, it will be found that they do not like cows and do not treat them as mothers. Their ideas seem to run along these lines:

Don't weigh your milk, for then you might have to figure and think.

Feed the cows timothy hay; it is good for race horses.

Cow testing associations are needless, a useless waste of money.

Don't have any windows in the barn, the hired man might want to look out.

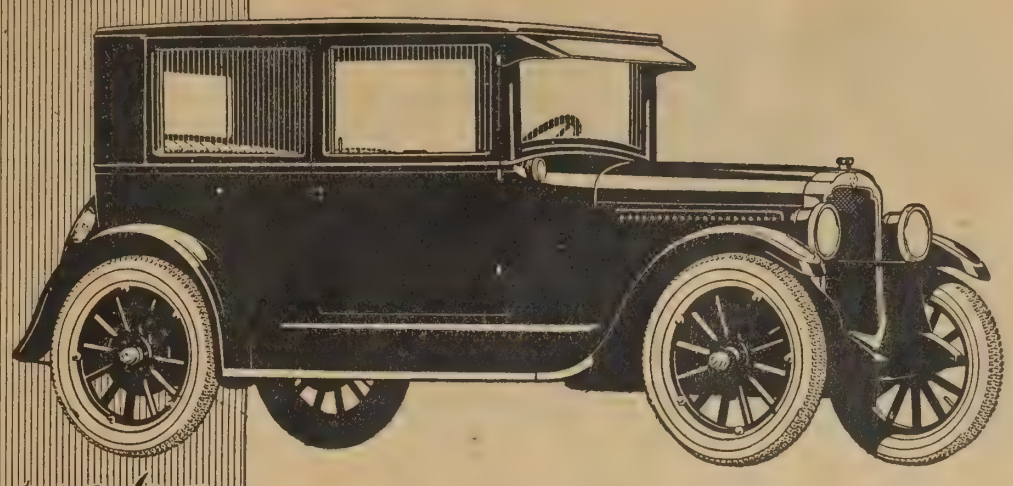
Keep the water ice cold; shivering gives the cows exercise.

Avoid heavy milkers, they consume too much time. Why, some of these cows have to be milked three and four times a day.

Former Governor W. D. Hoard, founder of Hoard's Dairyman, said, "Remember the cow is a mother and her calf a baby." I have often heard men famous in the dairy cattle world state this saying of Mr. Hoard's and in doing so their faces would light up with pleasure, and they have stated to me that this saying of the former governor gave them a new vision of the requirement of a dairy cow.

There are some dairymen who weed by guess, feed by guess, and breed by guess,—and they are continually kept guessing as to how they are going to get money to pay their bills. Some contend that the only way to get more money is to keep more cows. In a good many cases they are only milking cows for exercise and if they discarded the unprofitable cows through the use of the scales and the Babcock tester they would undoubtedly make more money, to say nothing of decreasing their labor.

My definition of a scrub cow is the kind of a cow that doesn't earn her board—the kind of a hired man we would call a scrub hired man. There are lots of both. The scrub hired man doesn't stay very long on one farm but the scrub cow does. Why? Simply because the farmer knows that the scrub hired man is no good but doesn't know the scrub cow is no good. He may have one such cow and he may have a dozen such cows in his herd. He is in need of a membership in a cow testing association.



Scrub cows are both born and made. Some farmers are not dairy farmers and never will be; they should never attempt dairy farming. In the hands of these farmers an A. R. O. soon becomes but little better than a good scrub. There are cows that are not built for producing milk in paying quantities. My experience with this class of cattle causes me to state that they are built for jumping fences and smashing down cornstalks rather than for milk production. They are built like a race horse and often with a disposition like that of a broncho.

Their owners put up with them year after year through force of habit; they keep cows by count rather than by reason. They get in the habit of keeping about so many cows and the individuality of the animals doesn't count for very much. The heifer calf is kept simply because it is a heifer calf and grows into full cowhood without the owner giving any particular thought as to whether the calf is a promising one or whether it gets the right kind of care. When IT becomes a milk producer he milks her simply because she gives milk and that is all there is to it. She stays in the herd until she is too old to chew her cud, and then she is fatted for the butcher. If she brings $30 to $40 for beef, the owner feels he has done well.

And this is what people call dairying in such a land as ours.

Illinois. C. R. BARKER.

When boasting of having "an open mind", do not mistake a vacancy for an opening.

OLDSMOBILE
Announces the
Fisher-Built Coach

BODY BY FISHER

A new Oldsmobile Coach—with "Body by Fisher"! A creation that embodies everything for which the name Fisher stands! Velour upholstered—and roomy and comfortable for five passengers! Big, wide doors give generous entrance space—the new patented one-piece windshield provides better ventilation and full driving vision.

And underneath this splendid coach body, with its Duco Satin finish, is the famous tried and proved Oldsmobile Six chassis. Only the body-building skill of Fisher, the unlimited resources of General Motors and the great manufacturing facilities of Oldsmobile could produce such a coach at $1065. Don't fail to see this coach—at your nearest dealer's.

The Measure of a Cow is by the pail

The real measure of a dairy cow is not by "hands" or body weight but the number of pails she fills monthly with milk rich in butter fat.

The ingredients in GOLD MEDAL VITAMIN DAIRY RATION are scientifically balanced, making it highly digestible and promoting growth and maximum milk production. Containing the wheat germ (embryo), it has a high vitamin content—that indispensable part of a cow's ration.

GOLD MEDAL VITAMIN DAIRY RATION is composed of Wheat Germ (Embryo), Linseed Oil Meal, Cottonseed Meal, Corn Gluten Feed, Wheat Bran, Wheat Middlings, Red Dog, Second Clear Flour, Ground Barley, Ground Corn, Ground Oats and Salt.

GOLD MEDAL HARD WHEAT MIXED FEED gives the cow a foundation for larger milk production.

NORTH STAR MOLASSES DAIRY RATION is a good, inexpensive milk producer.

The same organization mills GOLD MEDAL FLOUR and GOLD MEDAL FEEDS and unqualifiedly guarantees their quality.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets firm and active during week ending Sept. 20th. Weather conditions were favorable for quantity and quality production. Heavier demand for September-made cheese expected to develop. New York make short.

The average wholesale prices on American cheese, style Twins, for the week ending Sept. 20, 1924, for the corresponding week a year ago and for the previous week were as follows:

	Ave. for the week ending Sept. 20 1924	Sept. 13 1924	Sept. 20 1923
	Cts.	Cts.	Cts.
New York	21.9	21.1	26.0
Chicago	20.0	19.6	24.0
Boston	22.0	21.3	27.0
San Francisco	18.7	18.7	26.2
Wisconsin Boards	20.0	19.5	24.5

The receipts of cheese at these markets were 4,448,661 lbs. for the week as compared with 3,857,465 lbs. last week and 4,266,677 lbs. a year ago.

Twin City August Milk

For the month of August the Twin City, Minnesota, Milk Producers' Association paid $2.20 a hundred for 3.5 per cent milk f. o. b. St. Paul. For that portion sold as fluid milk the association received $2.50 from dealers. Almost one-third of its milk was sold in the form of butter and cheese, which at 41 cents a pound for fat brings $1.43 a hundred for milk. "Add 15 cents to this for skimmilk," says the Producers' Bulletin, "and you have $1.58. This accounts for 8 cents of our 30-cent spread. The other 22 cents is the expense of operating."

CHICAGO, Sept. 25—The butter market today was about steady on 92-score butter, but sentiment was mixed. Medium and lower scores were weak in buyers' favor. Concessions in some quarters were offered but buyers showed no interest and trade on all grades was quiet.

Fresh butter, 92 score, 35¼c; 91 score, 34½c; 90 score, 33½c; 89 score, 32½c; 88 score, 31½c; 87 score, 30½c; 86 score, 30c. Centralized carlots—90 score, 34c; 89 score, 32½c; 88 score, 30½c.

MILWAUKEE, Sept. 29—Butter, creamery, extra tubs, 35½c; standards, 34c; extra firsts, tubs, 33½@34c; firsts, 31@32c; seconds, 29@30c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 39@40c; ordinary firsts, standard cases, 37@38c; miscellaneous lots, shippers' cases returned, candled, 34@36c; seconds, dirties, 25@26c; checks, 24@25c.

Cheese—American full cream, Twins, 20@20½c. Young Americas, 20½@21c; Longhorns, 20½@21c; Daisies, single, 20@21½c; squares, 21½@22c; American, 32c; Pimento 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

FOND DU LAC, Wis., Sept. 27—Average cheese prices, majority of sales, f. o. b. shipping point: Flats, 21c; Single Daisies, 21c; Young Americas, 22c; Longhorns, 22¼c; square prints, 23c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Sept. 27: Single Daisies, 19½c. On Farmers' Call Board Sept. 26: Young Americas, 20c; Longhorns, 20½c; square prints, 21c.

NEW YORK, Sept. 29—Butter, firmer; receipts, 4,048 tubs; fresh supply, 62,472 tubs; creamery extras, 37½c; specials, 38¼@38¾c. Eggs quiet; receipts, 4,848 cases; fresh supply, 80,131 cases; white, fancy, 67@71c; fresh firsts, 40@53c; western whites, 34@66½c.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were weak and unsettled during the week ending September 20. Heavy receipts on the market contributed to lack of support of buying interests. Some storage butter is being used. Firm foreign markets favor exporting, but no real business was reported.

The average wholesale prices on 92-score butter for the week ending Sept. 20, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Sept. 20 1924	Sept. 13 1924	Sept. 20 1923
	Cts.	Cts.	Cts.
New York	37.5	38.4	46.9
Chicago	37.2	37.2	47.1
Philadelphia	38.5	39.4	47.9
Boston	38.3	38.7	47.5
San Francisco	38.2	39.6	48.2

The receipts of butter at these markets were 12,857,414 lbs. for the week as compared with 13,417,833 lbs. for last week and 12,319,438 lbs. a year ago.

Cloverdale and Silver Resign

The resignation of John W. Coverdale as secretary of the American Farm Bureau Federation and of Gray Silver, Washington representative, who have both been with the American Farm Bureau Federation since its inception in 1920, was presented to and accepted by the executive committee of the American Farm Bureau Federation in its regular session in Chicago, Sept. 15—17.

Both men stated in their resignations that they wished to devote full time to their duties with the Grain Marketing Company of which Silver is president and Coverdale secretary-treasurer. A resolution of indorsement of the Grain Marketing Company was also passed by the executive committee.

Ayrshire New Illinois Champion

Otterkill Hortence, an Ayrshire owned by F. C. Farwell, becomes the Illinois state champion producer on her 300-day yield of 14,954 lbs. of 4.36% milk, 652.16 lbs. fat; carrying a living calf 180 days of this period and thereby qualifying as the eighth highest producer in this division of the breed in the mature class, and winning one of the Ayrshire Breeders' Association's silver medals.—Ayrshire Breeders' Association.

"Wot you doin', chil'?"
"Nothing, Mammy."
"My but yoh is gettin' like yoh father."

The Ozark Stock Show

I. D. GLOBE, MISSOURI

THE dairy cow is rapidly claiming for her own the vast Ozark region of South Missouri and Northern Arkansas. That is the lesson of the sixth annual Ozark Stock Show at Springfield, Mo., Sept. 15 to 20.

When the first show was held five years ago, beef cattle and hogs claimed by far the larger share of attention, greatly outnumbering all other entries. The dairy cattle were so few as to make the lover of good milk cows almost weep with loneliness. "But the time will come when all this will be changed," said William Wiggins of Missouri, when the first show was over. "The day is coming when the visitor at this show will ask, "Where are the beef cattle?"

Wiggins, a veteran Jersey breeder who milked his way out of debt when his fruit ventures proved disastrous, was back at the show again to find his prophecy had come well nigh literally true. For at this year's show only two Shorthorn and three Hereford breeders made entries and only two breeds of hogs were shown, while the dairy cattle were the overshadowing attraction.

Twenty-six Jersey breeders from Missouri, Arkansas, and Louisiana made exhibits, while nine Holstein breeders from Oklahoma, Kansas, Nebraska, and Missouri provided the display of black and whites. Guernseys again offered an attractive exhibit, enthusiasm for this breed being a notable feature of the show.

"There were only 23 Jerseys at the first show," said Professor O. E. Reed of the Michigan College of Agriculture, who judged the dairy breeds the first year and returned again to make the awards at the show just ended. "This year we had 124, not so many as last year but of far better quality. It looked to me as if the Jerseys were 100 per cent better than I saw when I tied the ribbons here at the 1919 show. Better bulls are constantly being brought into this section and there is wonderful improvement over the animals shown here five years ago. The improvement in the young stuff is particularly gratifying. The Holsteins also are much better than formerly. As compared with last year, the Guernsey exhibit, although small, also has improved."

Reed did dairy extension work in the Ozarks a number of years ago when a cream separator was a curiosity and when believers in the dairy cow were almost as scarce as separators. Now one finds new breeders in almost every section; there are many prosperous creameries and one county looks upon its new condensery as its chief assurance of properity.

W. B. Young, Missouri, has been handling Jerseys for 20 years or more, starting with two grade cows. All this time he has been constantly endeavoring to build up his herd by the use of good bulls, having never bought any females outside those two foundation cows. This year he came to the show with a herd of Jeseys good enough to take two championships and first on everything he showed, except a heifer, and she took second. He had the junior champion female in Modeller's Oxford Fern and the junior and grand champion bull in imported Xenia's Noble Fern. Miss Alpha Durnell of Missouri showed the senior and grand champion female, Mollie's Polka Hunter. A. W. Lyon, Missouri, exhibited the senior champion bull, Rebecca's Fern Chief.

In the Holstein section A. J. King, Missouri, proved the principal winner, taking all the championships as well. His Hollyhock Sir Rhoda Korndyke was junior champion bull; Triune Ormsby Piebe 4th, the senior and grand champion. Miss Pearl Piebe was the junior champion female; Crescent Beauty Star Bell the senior and grand champion.

In the Guernsey competition W. H. Schatz & Sons, Missouri, exhibited the junior and grand champion female, Victoria of Terrell Creek; the senior champion female, Schatz's Ultra Countess, and the junior and grand champion bull, Pride of Willow Brook. The senior champion bull was Chick's Bonnie Boy of Oakwood owned by L. S. Myers of Missouri.

Much interest attached to the exhibit made by nine members of the Billings' Guernsey Association, organized at Billings, Mo., two years ago. The parish priest, the Rev. F. S. Enzweiler has been urging dairying as well as other good farming practices ever since he was stationed at Billings five years ago. The Guernsey association is one of the things he sponsored. Two years ago William H. Schatz of Billings and A. J. McDowell, dairy commissioner of the Frisco Railroad, went to Wisconsin and bought ten bred and 13 open Guernsey heifers in the district around Fort Atkinson for the association. Each member put his own money into the project and none could be found who was sorry. The association now numbers 14 members who own 40 females. All females must be bred to a bull selected by the board of directors who are required to visit each herd every three months, see to it that they are free of tuberculosis and properly handled. The bull the association now is using as head of its herd is Pride of Willow Brook, a great grandson of Ne Plus Ultra. Father Enzweiler attended the show to do what he could to further dairying, which is, he believes, the agricultural salvation of the Ozarks.

A closing event of the show was the organization of the Ozark Guernsey Breeders' Association with about 25 members to start with. W. W. Fitzpatrick of Clemson College, S. C., southern representative of the American Guernsey Cattle Club, was present to aid the breeders in organizing. Dr. C. E. Fulton, was elected president; A. J. Miller, vice-president; Joe Cologna, secretary-treasurer. The directors are L. S. Myers, Seth Libsey, W. H. Schatz, Prof. H. E. Dvorachek. Professor Dvorachek, who heads the animal husbandry department at the University of Arkansas, is an enthusiastic Guernsey breeder and believes these cattle will eventually play a leading part in the dairy development of the Ozark section.

Moldy Silage

To keep silage from molding the silo must be air-tight and the corn or other silage material firmly packed while filling the silo. Moldy silage may be caused by any one or more of a large group of fungi, commonly known as molds. These will not grow without the presence of oxygen, therefore if air is permitted to remain in the silage or to enter after the silo is filled, the molds will grow and the exposed silage will be spoiled.

Air may enter around the doors or through joints or cracks between the staves or even through porous material of poorly constructed silos. In this case the mold will be found about defects in the wall and not in the center of the silo. Repairing the defects is the remedy.

If the corn is cut too ripe or if it is frosted and becomes too dry it will not pack closely enough in the silo to exclude all air and moldy spots result. If there is not sufficient sap in the corn, water must be added to cause it to pack firmly and force out all air. Mold from this cause may appear anywhere in the silo.—Ohio Experiment Station.

His Second-Hand Car

"G-good heavens, Alfred! This second-hand car is awful!"

"Y-yes and the worst of it is, the dealer said it would last for years!"—From Everybody's Magazine.

It's the few EXTRA POUNDS that bring PROFITS

Adding linseed oil meal to each ration costs little, and it brings such good gains that you simply cannot afford to miss this source of extra profit. Any number of experiments and practical experiences will prove it. Consider these brief summaries:

Showed a profit of 300 per cent when added to a ration for cows in a Testing Association —Iowa

Was worth $85 per ton when added to a corn and tankage ration for pigs—Wisconsin.

Paid $12.79 per ton profit in fattening baby beeves—Minnesota.

Proved worth $13 per ton more than it cost in fattening lambs—Nebraska.

It's a rich, highly digestible, and slightly laxative food that raises the value of other feeds and keeps all animals in the pink of condition.

It's simply a matter of balancing what feeds you now have with this additional proteid and conditioner. The balancing need not worry you. It has been all figured out in our book—

"How to Make Money With Linseed"

By PROF. F. B. MORRISON
Asst. Director Wisconsin Agricultural Experiment Station and Professor of Animal Husbandry, University of Wisconsin. Author, with W. A. Henry, of the Recognized American Authority on Stock Feeding —"Feeds and Feeding."

Your copy is ready for you and it will cost you nothing. You will find it chock full of feeding rations which include all manner of feeds in various proportions with direct comparisons of Linseed Oil Meal with other proteids. This book is a record of actual experiences and one which you cannot afford to be without. It is free—By all means send for it. Ask for booklet T10.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Michigan Junior State Fair

"Timers ready? Get set, go!"

They were off. The race was on. At the first turn they were neck and neck. It would be a case of the best man wins. Tomorrow would probably bring its sore muscles as a result of this race. It would be a fight to the finish—the milking contest was under way.

"WE'RE TENTING TONIGHT"—CAMP GROUNDS OF MICHIGAN STATE FAIR JUNIORS

For three successive nights at the Michigan State Fair, boys and girls participated in the sixth annual milking contest. On Wednesday night fifteen girls participated. On Thursday night the boys competed. On Friday night occurred the grand champion contest in which the three winners at each of the previous contests competed.

MARK UP ANOTHER FOR HILLSDALE COUNTY—CHAMPION JERSEY GROUP

Who do you think the grand champion milker was? A boy—no, not this time. It was a girl. At each of the milking contests held during the past six years at the Michigan State Fair for boys and girls, Henrietta Rinke has been a very consistent winner. Four times she has been declared grand champion milker. The other two times she placed very close to the top. Henrietta is a girl nineteen years old and the remarkable thing about her accomplishment this year is that she has not been milking regularly this year. She stated after the contest that she had probably not milked more than fifteen cows during the entire year. Her record was to milk 20.6 pounds in eight minutes and five seconds. She had only .4 of a pound of strippings left in the cow's udder to count against her. Henrietta started milking at the age of eight years. Her father owns Holstein cows.

In second place was another girl, Lucille Helmich. In third place came a boy—a Hoard's Dairyman Junior. His name is Coe Emens. In the girl's milking contest held the first night of the three, Ethel Schoner was declared winner. In the boy's contest the next evening, John Clare Blade, milking a two-year-old Jersey cow, won out, but it so happened that neither of these winners placed in the top three in the championship contest held the last evening of the fair.

We believe you would have to go far to find an exhibit of handicraft work which would excel that shown at the Michigan State Fair in the Junior Department. Michigan boys are making many useful articles. In the same building you could see the exhibits of the club girls in canning, sewing, and other domestic art. Here, also, were held the demonstrations. Twenty-three boys' teams put on work in potato, poultry, handicraft, and dairy club work. Thirteen girls' teams competed in food and clothing work. The winning dairy demonstration team was composed of Luther Crantz and Arthur Nelson. They demonstrated upon sanitary milk production on the farm. The club department at the state fair was in charge of R. A. Turner, state club leader.

Fourteen dairy cattle judging teams composed of three members each competed in the dairy judging contest. The team winning first was from Calhoun County. The first four winners in the dairy cattle judging contest were Carlton Warner, Victor Beal, Wayne Adams, and Walter Maier. These boys represented the state of Michigan in the dairy cattle judging contest at the National Dairy Show. There was also a general live stock judging contest. Both contests were under the supervision of Nevels Pearson, assistant state club leader.

JAMES MAC TAVISH AND HIS GRAND CHAMPION HOLSTEIN CLUB HEIFER

More than three hundred head of live stock owned and fitted by Michigan boys and girls were exhibited at the State Fair. Hillsdale County featured in the exhibits and in the winnings. They brought five carloads of stock and competed for honors in the show rings. All the live stock exhibits were rather equally divided among dairy calves, pigs, and sheep. The club leader from Hillsdale County who is responsible for the large and splendid showing of that group of boys' and girls' live stock is L. H. Matthias.

There were just one hundred and six dairy calves paraded before Judge O. E. Reed of the Michigan Agricultural College in the show ring. Of these, approximately fifty were Holsteins, thirty-five Jerseys, and twenty-one Guernsey calves. Winners in the competition were as follows:

Holsteins

Bull class, 1st, William Gillis on King Cornucopia Kalmuch Houwtje; 2nd, Gerald Wells. Heifers two years old or over, 1st, Neal Brown on Johanna Beech Girl; 2nd, Gerald Wells on Model Sylvia De Kol. Senior yearling heifers, first and grand champion Holstein female, James MacTavish on Princess Irene Posch Beauty; 2nd, Robert Clement on Clement Segis Prilly. Junior yearling heifers, 1st, Ronald Craull; 2nd, Charles Monroe on Spring Valley Houwtje. Senior calf, 1st, Gerald Wells; 2nd, Coe Emens on Julet Johanna Lindenwood. Junior calf, 1st, Claude Gehringer, 2nd, Jacob Richter on Ona Stronghurst Bess. Club herd, 1st, Hillsdale County.

Guernseys

Senior yearling heifer, 1st, Keith Williams on Nivolette of Bon Ayre; 2nd, John Williams on Mirabella of Bon Ayre; Junior yearling heifer, 1st, Warren Crandell. Senior heifer calf, first and grand champion, Bernard Burden; 2nd, Orpha Patrick. Bull class over 4 months and under one year, 1st, Leta Lister; 2nd, Richard Gross on Gay Duke of Washtenaw. Club herd, 1st, Hillsdale County.

Jerseys

Senior yearling heifer, 1st, William Roose on Gambogis Clara Finance; 2nd, Roland Stein on Oxford's Idle Belle. Junior yearling heifer, 1st, Alton Hoopingarner on Golden Baron's Lady 2nd; 2nd, Floyd Anderson. Senior heifer calf first and grand champion; 1st, Warren Goss on Dolores Oxford Charming; 2nd, Laurel Bailey. Junior heifer calf, 1st, Raymond Corey on Oxford's Victoria. Bull class over four months and under one year, 1st, Edmund Shuart on Emmiento Minerva's Raleigh; 2nd, Vernon Shilling.

HILLSDALE COUNTY SHOWED THE BEST GROUP OF CALF CLUB HOLSTEINS—SEVEN COUNTIES COMPETING

Danny Solves a Problem

Foreword—In this chapter of the "Adventures of Daniel Dare" we find our little hero struggling with another phase of the corn subject—silage. Using Danny's formula, can you determine the capacity of the silo on your farm? What is your answer to the second problem given at the end of this chapter?

"Dad, how big is our silo?"

It was evening in the Dare household. The chores were done and the family was gathered around the table in the dining room. Mr. Dare was reading the latest copy of Hoard's Dairyman. Mrs. Dare was mending stockings. Danny's two sisters were playing checkers. But Danny was studying his lessons.

Mr. Dare looked over the edge of his paper. "Fourteen by thirty, son. Why?"

"Oh nothin'," replied Danny, "only teacher gave us a problem to work at home tonight. We have to find out how much silage our silo will hold. Then we have to find out some other things about silage."

Mr. Dare said, "Oh," and went on reading.

"Seven squared equals forty-nine," Danny figured out loud to himself. "Times 3.1416 equals 153.9384. Multiply that by thirty and you get 4,618.152. That's the number of cubic feet. The formula is radius squared times pi times height. Now to find the number of pounds of silage....

"Teacher said there are between 40 and 50 lbs. of silage in a cubic foot. So I'm going to multiply this first by forty, then by fifty. That gives me somewhere between 184,726 and 230,907 lbs. of silage. Divide that by 2,000 lbs. and I'll have the approximate number of tons...."

"Danny, when you talk so much, I can't think how to move," one of his sisters broke in.

"Never mind, girlie," Mrs. Dare spoke up, "Danny is getting his lessons."

"How much will she hold, son? I never figured it up, but I should judge about 85 tons." Mr. Dare, having finished the article he was reading became interested in Danny's problem.

"That's a pretty close guess, dad. The way I've figured it the answer is 92 to 115 tons. Say, father, what kind of corn do you grow for silage? Does it make any particular difference?"

"Well, I generally grow Silver King. It has nice big ears and matures fairly early. You remember

Do you know how much silage your silo holds? Danny Dare figured out that his father's 14'x30' silo holds between 92 and 115 tons.

we drilled in that piece we cut for silage. But the piece we grew for corn was check rowed. Do you know why that was?"

"Wasn't it because you got more stalks and leaves by drilling and you didn't care about whether you got such a big yield of corn or not?"

"Exactly, Danny." .....

The next afternoon when the class in agriculture was called to recite, it fell to Danny's lot to put his problem on the blackboard. Miss Edsel had him explain each step to the class. When he had finished she said, "You have done very well with your problem, Danny. I wish all of my pupils took as much interest in their work as you do."

Then to the class she said, "Who knows how many kinds of silos there are?"

A hand went up. "Ours is a cement silo, Miss Edsel. Our neighbor's got one made of wooden staves. Once I saw one made of tile."

"That's three different kinds right there. Good enough for you, John. Did any of you ever see a silo made of stone?"

"I did teacher. There's one down near our place. It's an awful old silo." Mark Mason had spoken his piece.

"Who can tell me why silos are round?" Miss Edsel challenged. There was a silence, then Danny came to the rescue.

"When they're round the silage can't stick in the corners and spoil."

"Very good. What does a silo make you think of?" This question was for Mark Mason.

"Work," promptly answered Mark. The class laughed.

"It makes me think of a giant preserve jar." Miss Edsel went on. "I'll

tell you why I think of it like this. Because in the first place it's cylindrical. So is the jar in which your mother puts up fruit. Second, it's the place where the corn will keep in a green condition for a long time. Your mother cans fruit so it will keep for you to eat in the winter.

"Now the silo and the fruit jar work a good deal on the same principle. The silage is packed in tight so that the air will be kept out. When there is no air, molds and harmful germs cannot work and spoil the silage. Your mother puts a cap and a rubber onto her fruit jar for this very same reason—to keep the air out. There is one more question we ought to settle this afternoon. When is the proper time to make silage?"

Danny was ready with the answer. "Dad cuts the corn when the majority of ears are dented."

"Good—here's another problem for you all to solve. You have found the capacity of your silos at home. It is said that a producing cow eats on the average a cubic foot of silage a day. How many cows might your father feed in six months if he were to feed out all of his silage in this time?"

Minnesota Calf Club Show

Minnesota had its biggest and best calf club show at the 1924 State Fair. The work of more than 2,000 young people in 4H club work was represented. The calf club barn was not large enough to house the splendid exhibits. Twenty juniors had to take their Holstein heifers over to the main barn.

Several Hoard's Dairyman Juniors were named winners, among them our good friend, Myrtle Himrum, whose story and picture appeared last winter on the Junior page. The yearling heifer class brought out eleven competitors this year. This class is encouraging boys and girls in the right direction. A very interesting contest was the competition by counties. Mower County with five Holsteins placed first.

Fifteen demonstration and judging teams represented dairying in the Junior arena. In addition all these dairy calf club members were given instructions from eight to ten each morning in a short course, one of the new features in the club department at the Minnesota State Fair.

Coleman Quick-Lite
TRADE MARK REGISTERED
"The Light of a Thousand Uses"

CARRY IT ANYWHERE!

YOU'LL have a lot of uses every night for this handy Quick-Lite Lantern. Carry it anywhere any night, in any weather. Hang it up, set it down—take it wherever you need light.

—Use it around your milking sheds.
—Use it for night hauling and auto touring.
—Use it around your barn and feed lots.
—Use it for night plowing and cultivating.
—Use it during harvesting for "rush" night work.
—Use it for all kinds of repair jobs and chores.
—Use it for fruit picking and packing.
—Use it in your tool shed, cellar, garage, granary.
—Use it for building jobs and road work.

The Quick-Lite is a regular man's size helper. Gives *good* light and plenty of it. Makes it *easy* to do any job *quicker*.

—300 Candle Power; more light than 20 old style oil lanterns. Shines steadily—no glare, no flicker.
—Lights with Matches; no torch needed.
—Won't Blow Out in Wildest Gale. Has wind-proof and rain-proof mica chimney.
—Can't spill fuel even if tipped over.
—Economical; over 40 hours brilliant service per gallon of fuel. Cost-to-use less than 2 cents a night.
—Solidly built of brass *and steel*. Good for a lifetime of helpful service.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

You will find a more complete discussion of the following questions in the September 26 issue of Hoard's Dairyman.

Tell about the record of Glenwood's Miss Greta. At the age of thirteen years she made a world's record for the Guernsey breed in producing 12,121 lbs. milk containing 642 lbs. butterfat. In the past nine years she has had twenty-nine descendants bred and raised at Shoreland Farm, Waukesha County, Wisconsin. Eleven records made by her descendants average 544 lbs. butterfat, the best record being 823 lbs. fat produced by her daughter, Guinan's Beauty.

Compare the feeding value of skimmilk and corn with corn and water for growing pigs. In experiments conducted at the Michigan Agricultural College, four Yorkshire pigs from the same litter were divided into two lots. Lot one was fed for a period of five months on shelled corn, yellow corn, and skimmilk. Lot two was fed on shelled yellow corn and water for the same length of time. At the end of five months the skimmilk pigs had made an average total gain in weight of 221 lbs., while the pigs getting shelled corn and water had made an average total gain of only 9.5 lbs. Skimmilk made the difference.

Will skimmilk develop stunted pigs? A pig was stunted up to the age of one year, at which time he weighed only 76 lbs. Skimmilk was then substituted for the water. Five months later he weighed 350 lbs. Skimmilk brought about a complete recovery of growth. (See article entitled "Food Value of Skimmilk".)

Name one way to increase farm profits. "Reduce the cost," says Wilber J. Fraser in his thirteenth article on "Ever Failing or Never Failing Pasture".

Give the best feed combination for a dairy feed. Sweet clover pasture for the summer six months at the rate of three-fourths acre per cow; one-third of an acre of corn for silage, and one-half acre of alfalfa hay per cow for the winter six months.

Junior Letter

Starting a Flock of Sheep

Hoard's Dairyman Juniors:—The boys and girls are very ambitious out here. But the people around here are trying to get up a canning club for the girls and a calf club for the boys, but things haven't gone very far.

On March 28th my old sheep gave birth to two little lambs, a buck and a ewe. The little buck won't nurse so I have to use a bottle. They are getting on fine now.

Well here I am talking about club work again. My brother has a registered Jersey cow and calf and a sheep to start on. But I've only got a sheep, two lambs, and some chickens. My father gave me ten bushels of seed potatoes, a third interest in an acre of cucumbers, and a vegetable garden to make money on. I'm going to high school so I need the money. My brother and I are going to start a flock of sheep from what we've got. My sheep's name is Daisy and her lambs are Pet and Billy. They haven't learned to come at my call yet.

Ohio. Florence E. Cooley.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

It will keep you warm and comfortable because

Reg. U. S. Pat. Off.

Brown's Beach Jacket

is made of warm, wool-fleece lined, knit cloth, cut to fit the body snugly without binding—a comfortable garment to work in. Then too, the cloth is very strong, will not rip, ravel or tear, and frequent washing will not harm it. The old reliable Brown's Beach Jacket is the most useful cold weather garment for farmers and all others who work or play outdoors. Three styles—coat with or without collar and vest. *Ask your dealer*

Position Wanted—Middle aged man, experienced, feeding, milking test cows. A 1 milker; after Oct. 5. Address BOX 307, care Hoard's Dairyman.

Storage Bin for Lime

The use of limestone on the farm land of much of Ohio has become so essential, says E. E. Barnes, soils specialist at the college of agriculture, that farmers in some sections have built limestone storage bins at their railway stations, so that the lime may be available at all times.

The value of the bins is largely that they allow the farmers to haul limestone when it is most convenient for them to haul. The ground limestone may be shipped from the quarry any time during the year, loaded from car into the bin immediately upon its arrival and hauled by the farmer when he wants it. The use of the bins, therefore, is a convenience for the farmers, the limestone producing companies, and the railroads.

Agricultural engineers have estimated that, where 500 tons of ground limestone are used during a year by a community served by one bin, the total cost per ton for the use of the bin is $1.08 and only 75 cents per ton if 1,000 tons are handled during a year. This cost includes interest in the investment (cost of the bin), depreciation on the bin, labor, manager's fee, and the necessary supplies.

Plans for bins to meet the need of a community may be secured from the Agricultural Engineering Department of the Ohio State University, Columbus, Ohio.

New Texas Record Set by A. & M. Cows

The Holstein production record of Texas was broken twice by animals in the College dairy herd the past year.

The mature cow record was first broken by Maude Posch Queen 2nd with a production of 21,916.6 pounds milk and 665.36 pounds fat, and soon after this record was bettered by another cow in the herd, Abbie Cornucopia Colantha Tinta, that set the state record at 22,733.7 pounds milk and 690.53 pounds fat.

In the same period of time a Jersey cow in the A. & M College herd bettered the record of the college animals by producing 749.83 pounds fat which is nearly 60 pounds fat more than that produced by the Holstein making the state record. This cow was Kelberg's Jacoba Pogetta.

Texas. GEO. P. GROUT.

Wayside Musings — MEETING THE TRUTH

JOSEPH S. MORRIS, WISCONSIN

TRUTH—how appealing it is! It is our proud boast that we favor the truth. We imagine that we always face the truth and act on what the truth yields up. But how easy it is to yield just a little. Facing the truth may mean the loss of a friend; some pet idea of ours may receive a jolt; facing truth may cost us a price we are not willing to pay. We are so human and it is so easy to go along accepting untruth or half-truth. We do not wish to have our pet habits upset.

Suppose we use a common experience of life to illustrate what we are driving at. Walking along the road or street it is quite a simple matter to slip up a side street or take a by-road to avoid meeting someone we do not especially care to meet. To use an expression which has become common since the coming of the automobile, we detour.

If you and I were to meet a new truth or a new expression of truth along the road of life tomorrow, how would we act? Would we go right up and extending the hand in friendly fashion say, "I am glad to know you?" Or would we detour to avoid the meeting and cling to half-truth or untruth?

This is really quite a searching question and much depends upon the answer we get. The great Master Truth Teacher once said: "And ye shall know the truth and the truth shall make you free." And that is just what knowledge of truth does—it sets us free. One of the happiest feelings that ever comes to men and women in our human affairs is to gain some new grip upon truth. It is sometimes attended with discomfort. It may mean the change of habits and set ways of thinking and doing, but in the end life is so much better and finer. We know that our children are going to get some hard knocks from life as they struggle to discover truth but we do not, if we are wise, try to prevent their learning wholesome truths. Nor should we, as men and women, seek to avoid the truth. Every mastery of truth, like the tedious toil up a mountain, leads us to a higher point and a broader view.

There are so many ways in which we might discuss this matter. How often we find that there is some person we hold to be unfriendly to us. We carry the thought of their enmity around with us and as we think about it it grows upon us. What is the truth of the matter? Have we gone and had a heart to heart talk with the person? Have we tried to work with him in some good cause? It may be that the very person we are thinking of as an enemy may be shy, timid, wondering how he can get acquainted with us. Put any two persons to working together in some good cause and it is remarkable what unsuspected good qualities they will discover in each other. It comes because they learn the real truth about each other. After all, we are all of us made up of a number of differing qualities.

I once saw some wax figures of great persons. They were likenesses of those great persons, dressed in the characteristic garb of the men and women they were portraying. There was Lincoln, and Bismarck, and Gladstone, and Disraeli, and Garibaldi, and many others. Now these figures did not help me to know these great personages. I had to know how they lived and what they thought, the truths they loved, the work they did before I could really know the truth about them, and it was a long and tedious process because there were men of differing viewpoints who had written about them.

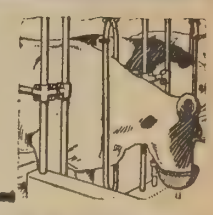
The quest of truth is a life-long process. We cannot suddenly turn a corner and come face to face with all the truth. We shall only know so much of truth as we make an honest effort to get hold of and apply. Happy are those who are always facing the sunlight, eager to know the fullest truth. Your life is such a wonderful thing. There is so much that is wise and good and beautiful and true, if only you will walk the road of life with open mind and heart.

Kansas Dairy Congress

HOARD'S DAIRYMAN:—New officers, the first permanent staff, were chosen at the closing session of the Kansas Dairy Congress, held during the Kansas Free Fair at Topeka. They were president, I. D. Graham, assistant secretary of the Kansas State Board of Agriculture; vice-president, Ira Romig, a Topeka dairyman and prominent in the state as a Holstein cattle breeder; secretary, H. T. Morrison of Topeka.

GUERNSEY COW, GALAXY'S FAWN
Circle W Farm in Ohio, owned by Walter C. White, and managed by Robert S. Martin, has produced another class leader record on their extensive breeding plant up in the Chagrin Valley. Galaxy's Fawn takes eighth place in class D, with her production of 14,457.5 pounds milk and 787.65 pounds fat. Her average test was 5.45 per cent. That she was a persistent producer is evidenced by the fact that she produced between sixty and seventy-one pounds fat during each of the eleven full months of her test period.—The American Guernsey Cattle Club.

The new "Dairy Congress", although operating under only temporary organization until this meeting, proved itself of value by bringing to the state some of the best thinkers on farm matters to study conditions and give the benefit of their observations and conclusions to the thousands who heard or read them in connection with the Free Fair. The shortcomings of the state, as well as its advantages, were pointed out in no uncertain way by one of the speakers and the tenor of all discussion was constructive and toward some definite objective.



Hon. Frank O. Lowden, president of the Holstein-Friesian Ass'n of America, was the leading speaker on the opening day. Following him during the three midday programs were such other men of agricultural prominence as Hon. M. D. Munn, president of the National Dairy Council; Dr. C. W. Larson, head of the newly created Bureau of Dairying of the U. S. Dep't. of Agriculture; Pres. William Jardin of the Kansas Agricultural College; Hon. E. T. Meredith, formerly secretary of the U. S. Dep't of Agriculture; Senator Arthur Capper, head of the "Farm Bloc" in Congress; Jos. H. Mercer, live stock sanitary commissioner of Kansas and Gov. J. M. Davis, the first real farmer governor Kansas has had in over a quarter of a century.

Kansas. THEO. W. MORSE.

WM. LOUDEN
Exhibited in 1907 the first all steel stall ever displayed at a National Dairy Show.

Louden Water Bowls increase milk flow within 24 hours. Lengthen the lactation period. Quickly pay big profits.

Keep Cows Comfortable—Increase Milk Flow

Good dairymen realize that the capacity of a cow to produce milk is governed very largely by her state of health and condition of comfort. Many an apparently mediocre dairy cow has been revealed as a high producer by a change of ownership, presenting the cow with more comfortable conditions under which to work and make milk.

From Ocean to Ocean and from Lakes to Gulf, thousands of practical dairymen are making extra milk profits from their cows, every year, as a result of installing Louden Steel Stalls and Stanchions. Their cows at the same time have a greater measure of protection against disease while much less time is required to take care of them.

Louden Manure Carrier—head and shoulders above any other carrier made.

The Louden Line also includes Hay Unloading Tools, Barn and Garage Door Hangers, Cupolas, Hog House Equipment, "Everything for the Barn."

Get the Most Out of YOUR Cows

Maximum comfort—"pasture comfort"—in the barn can be obtained only with Louden Steel Stalls and Stanchions.

Louden Swinging Stanchion holds the cow in her place yet allows her to get up and lie down comfortably, without lunging and struggling, without jamming her knees or bruising her shoulders. She can easily turn her head and card herself or lie with her head comfortably at her side. And the Louden is the only stanchion permitting the use of the High Built-Up Manger Curb, which prevents cows from nosing feed back onto the stall floor and wasting it in the bedding—a saving that counts up to many dollars in a short time.

Louden Stalls stand severe shocks and strains—do not get wobbly—outlast the barn. Made of Open-Hearth high carbon steel—strongest and best. Built with the famous Louden Interlocking Dust-Proof Coupling—a thoroughly patented Louden feature—smooth on top with no open crack to catch and hold dirt or disease germs.

Louden Steel Stalls and Stanchions were the first on the market and have been standard ever since. Selected by the U. S. Government. Write for illustrated printed matter and full details. Check the coupon.

Get Barn Plan Book—112 pages of practical facts that save money on barn building or remodeling. Illustrates 50 barns with floor plans. Check and mail coupon today.

CONSIGNED TO NATIONAL SALE

Proven son of 37th out of a 25 lb. dam with a 786 lb. year record made in 1911 in the Wisconsin Dairy Cow Competition. The dam of the bull we are consigning has three 30 lb. daughters including one who made 1,171 lbs. butter in one year and 36 lbs. in 7 days. This bull sires production and individuality. He has 7 daughters that average 20.23 lbs. butter and 408.3 lbs. milk in 7 days at an average age of two years and eight months. His offspring has won several prizes at both local and State Fairs. We are also consigning a 28 lb. daughter and a 21 lb. granddaughter of Terracelawn Hengerveld Segis, both with yearly records and good individuals.

D. W. HUENINK, Cedar Grove, Wis. WILL LOHUIS, Oostburg, Wis.

Horns Can't Grow!

After using TOMELLEM PASTE on calves up to 2 months old. An easy and safe way to do away with dangerous horns. One application enough. No bleeding, soreness or scars. Endorsed by county agents. Keeps indefinitely. Bottle sufficient for 50 calves. $1.00 Postpaid. At dealers or direct by mail from TOMELLEM CO., Dept. R, CALICO ROCK, ARKANSAS.

LUCY THOMPSON

Some Fire Don'ts

When I was only about six years old our barn burned down and in the fire we lost some stock. The money loss would not have meant much to some farmers but to us it was a tragedy and I can still see the haunted look on my father's face.

This incident, more than anything else, has always made me very careful about fires and I want to pass on to you some don'ts that I have recently seen. They are particularly appropriate now that we must be starting up the fires.

1. Don't put ashes in wooden containers.
2. Don't leave oily or greasy rags about.
3. Don't have accumulations of inflammable material in your cellar or attic.
4. Don't overload your electric light system.
5. Don't leave electric irons with the current on.
6. Keep matches away from children.
7. Avoid, as far as possible, the use of gasoline, etc.
8. Don't leave an open fire unscreened.
9. Never take a lighted lamp, match, or candle into a cellar where there is a smell of gas. This latter reminds me of a limerick which I thought very amusing:

"There was an old lady of Antrim
Who looked for a leak with a glim.
Alack and alas
The leak it was gas.
Let us now sing the fifty-fourth hymn."

Grape Juice

Grape juice is so useful a thing to have in the cellar that I hope you all have a good crop to put up, or that you will not find them too expensive to buy.

Of course we are all familiar with grape juice as a drink and there are many ways of changing it to make it attractive to a sick person who soon tires of having the same thing.

Another way of using it that I like even better is with ham. I take a whole ham or just a piece of one, parboil it in cold water to freshen it, and then put it in a pan for baking. I stick in the cloves on the fat side as usual (you can make these look interesting by sticking them in to make a pattern of some sort such as stars or crescents, or on the occasion of a birthday the initials of a person).

Then I pour over the ham about a pint of grape juice and let it bake slowly, covered, in this. A smaller amount will do and you can keep basting it. Pineapple juice is delicious for this purpose, too.

Here is a grape juice recipe that I like:

Wash and pick grapes off stems. Crush slightly and add water almost to cover. Heat slowly until it simmers, then strain through a double thickness of cheese cloth. Add one cup of sugar to one gallon of juice, scald bottles and corks, fill with hot juice, put corks in lightly, and heat with water at 180 degrees for 30 minutes. Tighten corks and when cool, dip in paraffin. I have often canned this successfully simply by sealing the boiling juice in well sterilized jars.

Indifference

There is something about a garden in late fall that is painfully lovely. It is shaggy looking, most always, and the weeds are there, and only a few things have retained their summer beauty. But there is a smell to the air that tells us to make the most of it for at best only a few weeks are left.

I was picking some cosmos only a few days ago when an airplane came flying and swooping over my head. Of course, I stopped and stared as long as I could see it and when I came in I hunted up this poem by Louise Driscoll. Several readers have asked for more poetry in the home section and I hope those will like this one called

Indifference

Over my garden
An airplane flew.
But nothing there
Either cared or knew.
Cabbage butterflies
Chased each other.
A young wren cried
Seeking his mother.
Gay zinnias
With heavy heads
Flaunted yellows
And mauves and reds.
A hummingbird
On late larkspur
Never knew
What went over her.
Crickets chirped
And a blinking toad
Watched for flies
On the gravel road.
They dont' care
How smart men are—
To go through heaven
In a flying car!
To a yellow bee
On a marigold
The adventure seems
A trifle old.

A Compliment to Our Women

I cannot tell you how pleased I have been with all the letters you have been writing to me lately. You said nice things—of course you would be too polite to do otherwise—but it was not that which pleased me most. It was the sincere wish you showed to get the best in life for your children for most of the letters lately have had to do with how to instruct children in the facts of life.

So pathetically many of the letters said, "I was not told anything and I do not want my children to have the experiences I had." In nearly every letter there was a note of apprehension that I longed to set at rest. We can only do our best, no matter how big or how serious the problem, and having done that let us be happy. Good spirits are so contagious and it is not the happy, bubbling child that is the child in mischief. So let us do what we can and then forget the worries.

I am proud of you for your intelligent interest in your children and your letters have made me feel much better acquainted with you. Write again.

It would not be fair to omit saying that the very first letter I got on this subject was from a man, presumably a Kansas father. I only wish that more men felt interested enough to co-operate in such problems.

Convenient Containers

I save all match boxes. These I cover with the more beautiful and artistic wall papers or with bright enameled paper, and sometimes put a little brass ring in the front of the sliding drawer. I cover the front and back of the little drawer. When I want the boxes for buttons or tape or hooks and eyes, I have the paper white and put ornamental lettering on, indicating the contents.

I find these boxes hold just about enough home-made candy to make a nice little present for a child. I find them immensely valuable for holding flower seeds of which I have so many kinds, and bulbs, etc.

They are handy for sending little things by mail, and are very pretty when daintily covered. One year I covered a lot of them and tied around them bright colored ribbons to match the paper. This ribbon, of course, remains a permanent ornament.

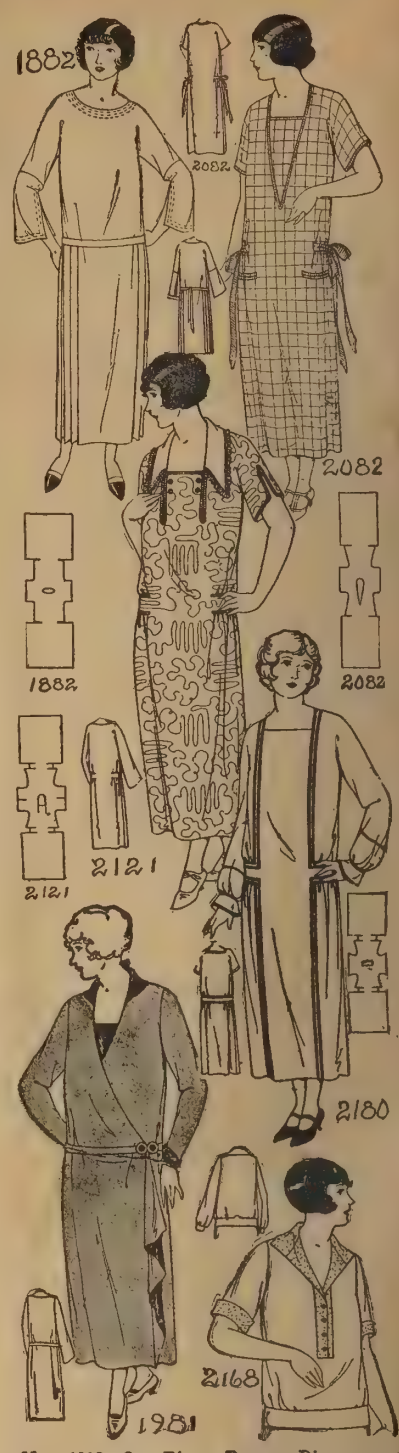
I also wash out at once, and keep, the paper containers in which the Dairymen's League ice cream is sold here. The little round containers, cylindrical in shape, vary in capacity from a half pint to a quart.

They are nice to pack cookies in for a lunch or to send away. They are strong and sanitary and are most convenient for holding all sorts of things. With holes punched in the top they make good flour sprinklers for pies. The edges should be gummed down with adhesive paper. They contain all kinds of spices (labeled of course, else you may do as I did the other day and liberally be-sprinkle a nice apple pie with black pepper instead of allspice) and as they are uniform, the shelf looks nice with them on it. Ornamental or plainly printed large labels can be cut from papers or soaked off from the paper containers.
—ELLEN DE GRAFF.

One Yard

Rastus was sporting proudly a new shirt when a friend asked: "Boy, how many yards does it takes for a shirt like that?"

Rastus replied: "Say, man, Ah got three shirts like this outa one yard last night."—Everybody's Magazine.



One housewife uses a piece of glass the size of her opened cook book to keep it open and protect it from being soiled.

A good wife is not a wife only, but a mountain of wealth; who possesses her is rich with her alone.—Proverbs of Spain.

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

No. 1882—One-Piece Dress. Diagram explains simple construction. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3¼ yards 40-inch material.

No. 2082—Becoming Morning Frock. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3⅜ yards 36-inch material. Diagram shows how simple this dress is to make.

No. 2168—Popular Slip-on Blouse. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 1½ yards 40-inch material with ⅝ yard 27-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

The stove that has last year's soot still in its stove pipe has got a right to kick and refuse to draw.

WINSLOW
MILK BOTTLES

WINSLOW BOTTLES have big national distribution because they offer distinct advantages to milk bottle users.

They're built for Strength. The Winslow truss-shaped bottom is neither too heavy nor too light. Every point on any circumference of the bottle is uniform in thickness. And the Winslow annealing process insures maximum resistance to breakage.

Winslow bottles are crystal-clear and unblemished. They give you full credit for cleanliness, purity and richness of your product, and help to hold trade. **Write for a sample bottle and prices.**

Friendly Talks for Farm Folks

We can't resist quoting the following from a classified honest-to-goodness ad: FOR SALE—One halter, one collar, and a dang good mare thrown in.

⚜

An old Chinese problem says that a tree blown down by the wind has more branches than roots. Think that over, you discouraged farmers.

⚜

To illustrate the fact that it is an ill wind which doesn't blow somebody good, it is reported that during the industrial depression in the East at present, with thousands of men in the towns and cities out of work, the fish-line factories are doing a land-office business night and day to keep up with orders. It seems that men go fishing when work is scarce, to keep themselves busy and not so blue, I suppose. And the folks with stock in the fish-line factories are reaping inflated dividends while the rest of the country is more or less down and out. Just one of those interesting cases of cause and effect with which this country is full.

⚜

Over at Richfield Four Corners at the approach of a sharp curve and open railroad crossing, there is a large sign which reads thusly: "If you make this curve and crossing safely, we congratulate you; if you fail to make it, telephone R123." A party of joy-riders one inopportune day became out of luck and managed to turn over on the curve and spill themselves all over the track in front of the Grand Limited. When the pieces had been swept up and the crowd had bethought themselves to get help, someone rushed to phone the ambulance, the doctor, the coroner, the undertaker and the garage. A little store adjoining the wreck had a phone, so several of the crowd rushed in there and demanded the numbers of the foregoing first aids. "Just call R123," said the store's lanky proprietor with entire freedom from excitement, "and you'll git Hen Bowers' ambulance; also Doctor Bowers; also Doc Henry Bowers which is our coroner on the Democratic ticket; also Bowers and Goodson, our leading funeral directors; and again H. B. Bowers, who runs the best garage and service station 'twixt here and Richfield." "You don't mean to say," said the motorists on 'phoning bent, "that this Bowers man will take entire care of this accident from A to Z?" "Yes, I do," answered the storekeeper tolerantly, "and into the bargain Hen is our postmaster, florist, and telephone exchange. Hen came here five years ago dead broke, but when he laid eyes on that crossing and curve out there, says he, 'This is the place for a live guy like me to settle. That crossing ought to be worth ten thousand dollars a year to the right person, if all competition is eliminated.' So Hen, he went to work and landed one office and then another, and he already had a doctor's diploma and had also undertaken more or less when younger, so take it altogether it ain't suprising that Hen is a rich man today as accidents seem to increase with gratifying frequency. Yes, sir—Hen is expecting to build a nice hotel over there by his garage if the curve and crossing accidents will give him time to 'phone to a contractor. You say five persons was killed and another probably done for? That's the way it goes. But you won't make no mistake in getting Hen to service 'em. He's the doggone best wart doctor and hoss trader and tire mender I ever knew. Just ring R123."

New York. HELEN S. K. WILLCOX.

Eastern States Exposition

(Continued from page 325)

This heifer possesses a good many admirable points but could not win over the older cow for the premier honors.

The awards are as follows:

Holsteins

Judge: W. S. Moscrip, Minnesota.

Bull 3 yrs. old or over—Connecticut Reformatory on Fair Oaks Sir Homestead Darkness. Bull 2 yrs., under 3—W. S. Kellogg, Connecticut, on King Pietertje Ormsby Piebe 36th. Bull 1 yr., under 2—Hargrove & Arnold, Iowa, on Triune Ormsby Piebe 27th. Bull calf under 1 yr.—Hargrove & Arnold on King Piebe 28th.

Cow 5 yrs. or over—A. D. Bridges & Sons, Connecticut, on Maggie Ormsby Butter Girl. Cow 4 yrs., under 5— Mt. Hermon School, Massachusetts, on Mt. Hermon Colantha Phyllis. Cow 3 yrs., under 4—Hargrove & Arnold on Dorothy Ormsby Piebe. Heifer 2 yrs., under 3, in milk—F. P. Knowles, Massachusetts, on Sylvia Rosewood. Heifer 2 yrs., under 3, dry—Hargrove & Arnold on Siebe Artis Burke. Senior heifer 1 yr., under 2—C. P. Farrand, Connecticut, on Bell Hill Mugget. Junior heifer 1 yr., under 2—Mt. Hermon School on Mt. Hermon Clarissa. Heifer calf—F. P. Knowles on Pearl of Highlawn. A. R. cow—Pinery Farms, Ohio, on Ormsby Halinger Mechthilde. Cow 4 yrs. or over which has produced in official test of 300 days or over, fat exceeding by 25% the requirement to A. R. or R. of M.—Pinery Farms on Kismet Fayne of Valley View.

Graded herd and young herd—Hargrove & Arnold. Dairy herd—Mt. Hermon School. Get of sire—Hargrove & Arnold on get of King Pietertje Ormsby Piebe. Produce of Cow—Mt. Hermon School on produce of Miss Gladice Butter Boy.

Senior and grand champion bull—Fair Oaks Sir Homestead Darkness. Junior champion bull—Triune Ormsby Piebe 27th.

Senior and grand champion cow—Dorothy Ormsby Piebe. Junior champion cow—Pearl of Highlawn.

Jerseys

Judge: W. W. Yapp, Illinois.

Bull 3 yrs. or over—Twin Oaks Farm, New Jersey, on Fern's Wexford Noble. Bull 2 yrs., under 3—Twin Oaks Farm on East Lynne Prince. Bull 1 yr., under 2—Twin Oaks on Counterstroke. Bull calf under 1 yr.—Twin Oaks on Oxford's Wexford Noble.

Cow 5 yrs. or over—Twin Oaks on Fern's Oxford Diana. Cow 4 yrs., under 5—Elm Hill Farm, Massachusetts, on Xenia's Surprise. Cow 3 yrs., under 4—Rockclyffe Farm New York, on Toffee. Heifer 2 yrs., under 3, in milk—Elm Hill Farm on Spy Girl's Surprise. Heifer 2 yrs., under 3, dry—Hempstead Farms, New York, on Fern's Highcliff's Xenia. Senior heifer 1 yr., under 2—Twin Oaks on Fern's Oxford Columbia. Junior heifer 1 yr., under 2—Twin Oaks on Fern's Oxford Silver Thread. Heifer calf—Twin Oaks on Fern's Oxford Melodant. A. R. cow 4 yrs., or under—Pinnaclerox Farm, Connecticut, on Xenia Secret. A. R. cow 4 yrs. or over—Inderkill Farm, New York, on Sociable Sybil.

Graded herd, young herd, dairy herd—Twin Oaks Farm. Get of sire—Twin Oaks on get of Imp. Fern's Oxford Noble. Produce of cow—Twin Oaks on Produce of Fontaine's Crown Princess.

Senior and grand champion bull—Fern's Wexford Noble. Junior champion bull—Counterstroke.

Senior and grand champion cow—Toffee. Junior champion cow—Fern's Oxford Silver Thread.

Ayrshires

Judge: Lester Ortiz, New Jersey.

Bull 3 yrs. or over—Middlesex Meadows Farm, Massachusetts, on Imp. Auchenbrain Toreador. Bull 2 yrs., under 3—Middlesex Meadows Farm on Imp. Grange Gentleman. Bull 1 yr., under 2—Barclay Farms, Pennsylvania, on Strathglass Roamer. Bull calf under 1 yr.—Alta Crest Farms, Massachusetts, on Alta Crest Weather Vane.

Cow 5 yrs. or over—Alta Crest Farms on Imp. Holehouse Buttercup. Cow 4 yrs., under 5—Alta Crest Farms on Imp. Netherton Carmen. Cow 3 yrs., under 4—Alta Crest Farms on Alta Crest Spicy Queen. Heifer 2 yrs., under 3, in milk—Monstone Farm, Massachusetts, on Monstone September Morn. Heifer 2 yrs., under 3, dry—Barclay Farms on Barclay's Carnation. Senior heifer 1 yr., under 2—Barclay Farms on Barclay's Brown Betty. Junior heifer 1 yr., under 2—Barclay Farms on Barclay's White Flower. Heifer calf—Alta Crest Farms on Alta Crest Hillbrow. A. R. cows 4 yrs. or younger—Pennsylvania State College on Penshurst Marion. A. R.

Breed Character as Illustrated in the Herd Sires at

EMMADINE FARM

RESOLUTE 71989

Our bull calves are the result of carefully selected crosses of the breed's best blood. We have built up our herd with careful attention to individuality and production. Emmadine Farm, with its famous herd and sires, will be working for you long after you have made your purchase. Write us for descriptions and prices if you are looking for a bull calf.

Our Successor Berkshires well merit the attention of every farmer interested in breeding profitable hogs.

Senior and grand champion bull—Shorewood Resolute. Junior champion bull—Valiant's King.

Senior and grand champion cow—Mixter May Princess. Junior champion cow—Gayhead's Clematis.

Manure Makes Potatoes

The great value of farm manure in potato culture was demonstrated perhaps as never before in Minnesota by a ten-year trial. Stable manure proved profitable in every case, reducing the growing cost per bushel. The growing cost in the course of the experiments was 69 cents a bushel of marketable potatoes when no manure was used; 30½ cents a bushel with 5 tons of manure to the acre; 27½ cents with 10 tons to the acre, and 22½ cents with 20 tons.

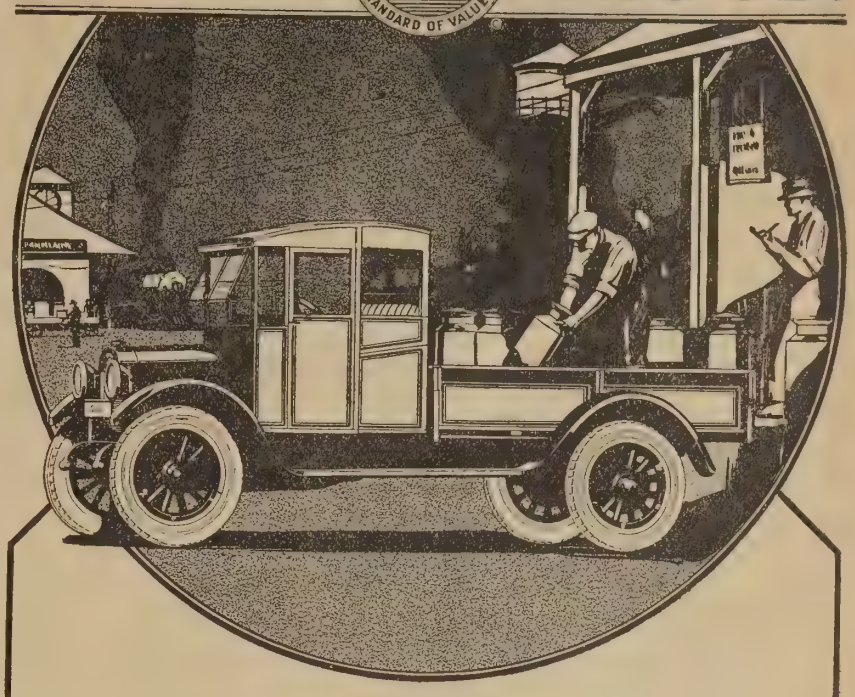
Where 5 tons of manure were applied each third year for nine years, the yield of potatoes in 1923 was increased 18.9 bushels for each ton applied; manure applied at the rate of 10 tons per acre gave an increase of 13.3 bushels for each ton, and at 20 tons an acre the increase was 10.9 bushels for each ton.

Among the other facts disclosed or emphasized by the investigations are the following:

That Green Mountain potatoes can be recommended as one of the best late varieties for north central Minnesota, and that Irish Cobblers out-yield all early varieties.

That immature seed has given fully as good results as mature seed and that seed grown on peat land has been fully as satisfactory as seed from mineral soil.

That the yield varies directly with the size of the pieces planted, whole tubers producing a larger yield than either halves or quarters.



That in north central Minnesota the best time for planting is from about May 20 to June 10, early varieties for the summer market to be planted as early as weather and soil conditions will permit.

That net profit from potatoes must be sought in large yields to the acre rather than in large acreage with average yields.

That farmers growing seed potatoes for spring delivery should provide an outdoor cellar with ample ventilation and protection from frost; basement cellars usually being unfit on account of uneven temperatures.

Copies of Bulletin 212 that report the result of this ten-year experiment may be secured by writing the College of Agriculture, University Farm, St. Paul, Minnesota.

SPEED WAGON
THE GOLD STANDARD OF VALUES

Master of Rural Transport

TIME-SAVING travel combines with sureness of performance to make the Speed Wagon most faithfully serve the rural owner.

Keen understanding of the farmer's haulage needs shows in every phase of Speed Wagon design and manufacture. Mighty power, brute endurance, pneumatic tires, moderate chassis weight, driving simplicity, load capacity,—

All are embodied so that stall-free operation—anywhere, anytime and with any load—becomes a fact.

Only the Speed Wagon has the Speed Wagon's combination of economy-making features,—moderate price, remarkably low operating costs and long lasting qualities. However figured, the Speed Wagon saves more and earns more than any other commercial car built.

Capacity, 500 to 2500 pounds. Twelve standard bodies—open and closed cabs. Chassis price $1185 at Lansing. More than 100,000 in operation. Designed and manufactured in the big Reo shops,—not assembled.

REO MOTOR CAR COMPANY, Lansing, Michigan

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

HOARD'S DAIRYMAN
Fort Atkinson Wisconsin

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

The most important development since the cord tire itself—that's what they're saying of SUPERTWIST, the remarkable new cord fabric perfected by Goodyear! The superiority of this enduring material lies in its greater elasticity—it far *o-u-t-s-t-r-e-t-c-h-e-s* the breaking point of standard cord fabric. Hence it affords Goodyear Tires extreme protection against stone bruise and like injuries. SUPERTWIST is used *only* by Goodyear, and is built into Goodyear balloon tires of *both* kinds—to fit new wheels, or the wheels now on your car.

He Recommends E-B Spreader to His Neighbors

If you are not quite convinced that the E-B Spreader is your best investment read this letter from H. S. Garman, Adeline, Ill., mailed under date of Jan. 5, 1923.

"I purchased an E-B No. 1 Spreader three years ago, and I am more than pleased with the work of the machine. The machine has cost nothing for repairs, and I have recommended it to many of my neighbors. I think your Spreader is a first class machine and away ahead of other makes in shifting gears and loading capacity. The straight hitch of horses is a great factor in pulling the machine. I will recommend E-B Goods to any one—they are O. K. all around."

Breeding to the Breeders

(Continued from page 323)

ing process practiced so persistently has reduced our herd to descendants of three old cows which finally measured up to our requirements, and now when we are passing on to the sixth generation, we rarely find a cull."

"But, Mr. Dickson," I protested, "suppose your are able to choose your females for breeding in this manner, is it not possible to select an inferior bull and thereby, to a large extent, defeat or at least retard your plans for improved breeding?"

"Yes, and in this very thing many amateur breeders fail. There are three ways to select a bull. First, by his looks, or conformation; second, by his pedigree, or, in other words, by the character of his ancestry and relatives; and third, by his proven ability to sire daughters that are superior to their dams, and such a bull usually has both breeding type and pedigree.

"The fact that a sire displays good type does not prove that he has in his blood that quality that begets better daughters. The second method of selecting by pedigree and production records of ancestors and relatives is more dependable but not always certain. The third method of selecting a bull that has sired superior daughters *is sure.*

"If we find the bull's daughters to be uniformly better in production, vigor, and type than their dams, as determined in our herd, or on cattle of similar type and breeding we at once make him a herd sire, for we feel sure that this power to transmit these qualities is in his blood and he will exert this same influence on all of his daughters. Should he fail in this, no sentiment is spared in discarding him and his progeny.

"When this strong breeding power is brought together in both male and female for a number of generations, it becomes well fixed in the blood and our experience shows that it does not take long to greatly reduce the number of culls. And, on the other hand, each generation makes a surprising average gain in quality and production over the preceding generation.

"Breeding to the breeders who have a tendency to pull up is, therefore, our motto with the males as well as with the females, even though this method of selection is expensive and requires a great deal of time to wait and watch. By following this method there is no guesswork and this is why each generation of our herd is superior to the preceding generation."

The correctness of Mr. Dickson's theory on the selection of bulls is confirmed by actual results, as we note in the Jersey Bulletin of November 7, 1923, in a scientific study made by Professors C. W. Turner and A. C. Ragsdale of Misssouri Agricultural College, on the "Register of Merit of Jersey Sires Compared". This survey shows that the last two of Mr. Dickson's proven bulls stand fourth and seventh, in a list of 354 Register of Merit bulls, and these represent practically all of the last ten years' work of the herd. However, not contented with mere assertions, I said, "Mr. Dickson, can you provide me with records that will substantiate your last statement?"

"Yes, but I want you to understand definitely first of all that we have not sought for extremely high records. We are breeders and not feeders. Our cows get no particular petting beyond that received in the ordinary herd and the two world's record cows in our own herd have each done better afterward on common hard work. The records beginning with the highest record of the three old foundation cows and their offspring for five generations which I present here are made by the American Jersey Cattle Club under the supervision of the Oregon Agricultural College, and some of them are from animals sold to others who were eager for breeding power. They follow:

Generation	Age Yrs.	Age Mos.	Lbs. butterfat in 12 months
I	10	2	459.30
II	2	0	513.95
III	3	2	547.94
IV	4	2	729.97
V	1	10	860.08
V	5	10	844.64*

*In 305 days, Class AAA.

"While these figures are for the tops of each generation, this same proportional increase has been kept up throughout the entire herd and at present there is hardly a mature animal that will not produce 700 pounds fat in twelve months if given the same feed and care that officially tested cows usually get."

I asked a dairyman of national repute, who is acquainted with all the breeders of the country, in what respect Dickson differed from most other breeders. His reply is worthy the consideration of every embryonic dairyman. He said, "Dickson has a definite goal in mind, aiming at a development of a high uniform average for the whole herd instead of a few outstanding individuals. He is marshalling all natural forces and making use of all scientific information to accomplish this end and is ever moving to higher levels. While some breeders occasionally hit the right combination in producing a high record animal, Dickson is obtaining his in increasing numbers by having laid his foundation with scientific accuracy.

HOLLOW TILE BLOCK MILK HOUSE ON FARM OF EMIL ANDERSON, MICHIGAN. CONCRETE FRAME FOR HOTBED IN FOREGROUND

POULTRY On The DAIRY FARM

O. A. HANKE

Does a Farm Flock Pay?

Interest in farm poultry was never greater than at the present time. One need only drive a short distance through the country to become convinced of this fact. Colors are still mixed on some farms but a goodly number of them are now on the straight flock basis. Improvements made in scientific feeding, breeding, culling, and housing account for this great improvement.

A flock of hens is a very valuable asset to any dairy farmer. He should consider a flock of from two to five five hundred layers as one unit of a well diversified farm. The dairy farmer has the land, the soil, and the range. He is in a position to grow a great deal of his own feed. If he carries a good sized flock of laying hens as a side line, he has the added advantage of feeding his own feed upon his own place, thereby securing an additional profit from it.

Although great profits are made by small poultrymen with restricted range and purchased feed, the dairy farmer is in a more enviable position to secure profit with cheap feed secured largely by the hen herself. The hen has proven to be a great scavenger. Many farmers overestimate the hen's ability as such and do not add enough feeds to her daily diet to supply a well balanced ration which is so necessary for egg production.

Poultry makes the greatest spread of profit and quickest turnover of any branch of live stock farming. One new unit of poultry can be produced in six months while it takes more than a year to produce a new unit of any other branch of live stock. A hen consumes only seventy-five to ninety pounds of feed during a producing year while the dairy cow consumes several times that amount and perhaps not net as much profit as one hen.

The following table gives the relative feeding efficiency of farm animals. In this table the relation of feed consumption to egg production is based on the low average of 100 eggs per hen per year.

One hundred pounds of digestible matter produces:

13.9 lbs. milk worth 2c per lb.	$4.17
13.5 lbs. steer (live weight) worth 9c per lb.	1.215
13.9 lbs. sheep worth 7c per lb.	.973
30.4 lbs. swine worth 9½c per lb.	2.888
19.6 lbs. fowl worth 20c per lb.	3.92
22 lbs. eggs worth 27c per lb. (40c per doz.)	5.94

The rapidity with which the feed fed into poultry will secure a cash return, the comparatively short time in which the working units may be replaced, the slight capital involved in any one unit, and the fact that hens are the most efficient users of the feed consumed, all combine to make this branch of farming a matter of serious consideration to the dairy farmer. The rush season in poultry work comes during the winter and early spring months when the dairy farmer has little to do, other than the general chores. Chick brooding work is usually well under way when the spring work begins. During the summer the pullets will grow under hopper feeding quite well and the layers need little attention save periodic cleaning of the quarters, possibly on rainy days.

Anywhere from 200 to 500 layers is considered a fairly satisfactory unit. Any farmer who keeps poultry as a side line must consider which will be the most economical unit for him to keep. A flock of 200 ought perhaps to be a minimum. Little more equipment is needed for 200 than for 100 to 150. The farmer with a flock of 200 can ship eggs in 30 dozen cases and secure better prices at the large markets. With good organization and a 10-hour day, it is reasonable to estimate a 200-hen flock on the farm should not occupy an able-bodied person more than three hours daily the year round as a general average, while 4½ hours daily should well meet the requirements of a 400-hen flock. On a labor income of $2 per hen that would mean an annual income of $400 for a three-hour day or $800 for a 4½-hour day. Reports from demonstration farms in Missouri show that a farm flock which will average 103 to 132 eggs per hen will give a labor income from $2.44 per hen to $3.76 per hen. (From labor income had been deducted all expenses other than those of the labor.)

The poultry industry has been filled with talk of overproduction. The spring of 1924 saw more baby chicks produced than ever heretofore. Today the reports state that the pullet crop is short. The unfavorable spring weather made chick raising a serious problem to the beginner this spring.

Nineteen hundred and twenty-five promises to be a very profitable year for the poultryman. Eggs are very scarce now on the city markets and threaten to be less plentiful this fall and winter. A long, cold winter will boost egg prices to unusually high points.

Nearly every farmer today has 75 to 200 pullets growing on range whether it be the range around the farmstead or an individual range farther away. These pullets will spell profit or loss this winter. With skim-milk as a by-product of the dairy, the dairy farmer should never experience any trouble with his pullets. A fall molt is unnecessary. A little scientific attention at this time will aid materially in producing a fine pullet.

no salt crust

Meat curing results prove "there is a difference"

Salt is used in meat curing to prevent decomposition. Colonial Special Farmer's Salt dissolves, penetrates and begins its work the moment it is applied. It penetrates through every fibre. The meat is evenly cured—firm and tender—all its original color and flavor retained.

Colonial Special Farmer's Salt is porous—flaky. Unlike ordinary salt, it dissolves instantly and completely. A 70-pound bag is as big as 100 pounds of ordinary salt. The bags make good toweling.

"There is a difference"

No. 1 microphoto shows ordinary salt. The hard cube-like shapes cement together, harden and cause salt crust. No. 2 photo shows Colonial Special Farmer's Salt. Note its soft porous form; dissolves instantly—penetrates evenly—never hardens. In stock feeding, won't cause sore tongue.

GOULDS PUMPS AND WATER SYSTEMS

Electric driven water system. Two capacities. Outfit W2—180 gallons per hour. Outfit V2—360 gallons per hour.

Health and Happiness —from Running Water

Lack of running water is an unnecessary handicap on the health, comfort, good looks and happiness of any family.

A Goulds pumping system will supply all your needs for years for a few cents a week. It will pay for itself in 12 months as a time saver, and solve your water problem for once and all.

No matter how difficult you think your individual water problem, bring it to Goulds or to a Goulds dealer.

Goulds Pumps and Water Systems come in various types, sizes and capacities to meet every need of farm or suburban home.

There is a Goulds water system adaptable to all demands for kitchen, bath, laundry, stock watering, garage and grounds. First costs are surprisingly low and operating and maintenance costs are almost nil.

Write for booklet giving details of our complete line of electric and engine driven pumps and water systems for every need.

Good appetite
Good digestion

MORE MILK

GOOD HEALTH, good appetite and good digestion are the essentials of a good milker.

Every cow in your herd can be put in milking trim with a course of

Dr. Hess Stock Tonic
A Cow Tonic and Regulator

Your cow is a machine. To convert your grain, hay, silage and fodder into pails of milk is her function. The more she eats each day, if she is able to digest it, the more milk you get.

Dr. Hess Stock Tonic contains the dairyman's favorite remedy, Nux Vomica—the greatest of all nerve tonics—cow remedy, appetizer and digester. It contains Quassia, a stomach tonic; whets the appetite, promotes digestion. It contains Diuretics, to keep the kidneys active. It contains Laxatives, to keep the bowels regular, so that there is no clogging of the system during heavy feeding.

Buy it by the pail

Just regular milk giving where Dr. Hess Stock Tonic is included in the ration.

Excellent for cows at calving time. No retained afterbirth. Feed it before freshing. Good alike for all cattle.

Costs Little to Use
The price of one gallon of milk tonics a cow for two weeks.
25-lb. pail, $2.25; 100-lb. drum, $8.00
(Except in the far West, South and Canada)

Honest Goods—Honest Price. Why Pay More?

REMEMBER—*When you buy any Dr. Hess product, our responsibility does not end until you are satisfied that your investment is a profitable one. Otherwise, return the empty container to your dealer and get your money back.*

Keeps the Dairy and Stables Healthful and Clean Smelling

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Rheumatism in Cattle

Cattle are not quite so subject to rheumatism as was at one time believed, or it may be said that what was thought to be rheumatism in some cases was not that disease. We have arrived at this conclusion from "thinking back" about many a case treated in by-gone days. It pertains especially to those cases which were diagnosed as chronic rheumatism. Many of those we now believe were due to deficiency of lime salts in the system. It has been shown by nutrition chemists that a pregnant cow when not given sufficient mineral matters in feed has to borrow it from her bones. Lack of a necessary vitamin in legumes and green feed, which has the effect of increasing assimilation of lime salts, is also involved in this matter. When legumes, especially those in the green state, are fed along with a well balanced ration of other nutrients, lime deficiency does not occur and the cow and her fetus thrive normally. When lime is lacking and borrowing results, the cow may become stiff, sore, lame, sluggish, thriftless, and, in short, show symptoms often attributed, in the past, to rheumatism.

In our experience, old pregnant cows are most liable to such deficiency disease. They have difficulty in rising when down. Often they wobble when walking. In some cases they stand humped for a time on rising and owners have concluded or suspected that "urinary trouble" was the cause. In all cases of this sort we strongly advise immediate application of the tuberculin test, as tuberculosis of the bones (vertebrae) of the spinal column may be the cause and that is incurable. When tuberculosis is not found present the ration should be the next consideration and complete feeding and supply of minerals should be instituted, as well prescribed in bulletin 350 (Minerals for Live Stock) of the Wisconsin Agricultural Experiment Station, at Madison. Pregnant cows should also occupy roomy, dry, well ventilated and bedded box stalls or pens in preference to being stanchioned.

When tuberculosis is absent and the ration is adequate and complete, treatment for rheumatism may be given, "on general principles", and will be likely to succeed, if the disease actually is present. Salol, salicylic acid, and urotropin are most useful as medicinal remedies. Colchicum and catechu have also been administered with good results. The experience of the veterinarian is necessary to select the most suitable remedy and decide the appropriate dose. Often he will find it well to start treatment by giving a full dose of saline purgative. That is most often the case when the animal is fat and constipated. Thin, weak cattle on the contrary will require stimulants and tonics.

Local treatment is also necessary, especially when joints are much inflamed and intensely painful, in articular rheumatism. Chloroform liniment combined with anodyne tinctures is excellent for rubbing upon inflamed muscles. Antiphlogistine applied hot may help when the joints are inflamed. Often relief is given by covering affected parts of the legs with thick layers of cotton batting after rubbing with alcohol. Blistering may be necessary in chronic conditions following the stage of acute inflammation.

It is especially indicated to keep cows out of new stables of concrete construction until they have dried and perfectly to ventilate basement stables and to keep them as dry as possible to lessen likelihood of rheumatism.

Spoiled Quarters

I recently purchased a pure-bred Guernsey 3-year-old heifer that freshened about 2 months ago with first calf. The former owner of this heifer tells me that the heifer came fresh on pasture and that he was so busy with other work that he did not give her the attention she should have had. He thought the calf was taking all the milk and by the time he noticed it the front half of udder was badly caked and dried up and is not now giving any milk at all out of front half of udder. This heifer is a very likely looking heifer and if there is any way to bring back the front half to milk I certainly would appreciate knowing it.
Diamond, Pa. H. I. S.

There is practically no chance that the dry quarters will secrete normal milk at a subsequent "freshening" as garget has caused loss of function. In such cases the disease often returns worse than ever at calving time and eventually ruins the udder. Such a cow is a menace in that she may similarly infect other cows, mammitis, mastitis, or garget, in its worst forms being caused by invasion of pus-producing germs (streptococci). Better dry off the milk secretion and fit the animal for slaughter.

Sore Ears

I have a Guernsey heifer calf six weeks old which has little yellow pimples all over its ears, inside and outside, then they seem to dry up and form a scab. It seems to be spreading to its back and jaw; do not think it is ringworm.
Winona, Minn. L. T.

Flies may cause or greatly aggravate such a skin disease as you describe. It may be ringworm but that usually attacks the skin of the face, about the eyes, and on the neck. Scrub the parts clean and when dry rub in some strong iodine ointment and repeat the application when seen to be necessary. If flies annoy sprinkle a little iodoform powder on the affected part, or apply a mixture of one part of oil of cajuput and three parts of olive oil. Ringworm is contagious. Isolate affected calf. Cleanse, disinfect, whitewash, and properly light and ventilate the calf pen or house.

Information on Barrenness

I have a heifer which does not breed. Since this is a rather common occurrence here, I would like to have some literature about treatment of the ovaries of cattle.
St. Ignatius, Mont. O. B.

The method of manipulating the ovaries by way of the rectum for rupture of cysts or dislodgement of persistent "yellow bodies" can only be learned by practice after becoming perfectly informed relative to the anatomy of the parts. A qualified veterinarian should therefore be employed for the work. Such information relative to barrenness and its treatment will be found in book entitled "The Sterility of Cows", by Dr. J. Albrectsen of Denmark, published by Alex. Eger, (Vet. book publisher) Chicago, Ill.

Southern Hay

HOARD'S DAIRYMAN:—The hay problem in the case of the southern farmer with a few cows is different from that of the dairyman. Where there are only a few cows legumes following the oat and wheat crop provide a large part of the hay. But the dairyman with several cows is thinking of silage first and hay second.

In either case the hay crop of the cotton belt must be primarily a legume. Bermuda and lespedeza do not grow high enough, as a rule, to be harvested for hay.

Of all legumes the cowpea is most generally used for hay. Seeded as a second crop after wheat and oats, cowpeas make a fair yield of hay if there is good summer season, but if there is a shortage of rainfall then the crop is poor and the farmer who depended on it is short of feed.

The soy bean is more dependable through drouth or excess rainfall than cowpeas. Where cowpeas would die out completely under severe drouth or be drowned out by excessive rain, the soy bean will hang on, revive when the conditions change, and make a fair crop of hay. But many southern farmers have not become acquainted with these virtues of the soy bean and soy beans are grown only in a limited way. Its popularity is, however, spreading rapidly and in a few years the cowpea will be sharing its acreage largely with soy beans.

It is to be feared, however, that neither cowpeas nor soy beans sown after cereal crops are going to fully solve the hay problem of the southern farmer. While these legumes should always follow wheat and oats, there should also be some land where soy beans and cowpeas are given a full season's right of way to produce hay. If the weather fails and greatly reduces the yield of the late sown legume, it is not at all likely to have the same influence on the early sown.

Some dairymen in the South sow oats and vetch in the fall and cut it early for hay in the spring. This gives time to put in a summer legume early with greater certainty of a good yield. They also find after this early harvesting of oats and vetch as hay that there is time for growing a silage crop of corn on the same ground. Of course if the oats were not harvested until they were full ripe, the opportunities for a succeeding hay crop or silage crop would be reduced.

Many southern farmers have learned to cure soy bean or cowpea plants in large cocks instead of allowing them to blanch and dry out on the ground before they are handled. The new way gives the hay higher feeding value, besides it saves the great loss from shattering that characterized the old method. Stakes with cross bars at the bottom afford the ventilating frame work on which green and freshly cut plants will cure out splendidly.

In the western part of the cotton belt, hay or roughage production faces shortage of moisture and in that region sudan grass and other plants of the sorghum family are more dependable, more so than in the Southeast where the warm, moist weather develops disease on some of the sorghums. Johnson grass has its partisans for and against. It is a heavy producer of the hay but it is a soil pest when its eradication is needed, and if allowed to mature the manure of animals feeding on it is likely to sow Johnson grass where it is not needed.

Beggarweed, kudzu, napier grass and Japanese cane are popular in the gulf region though not yet extensively developed. Peanut tops and bunch velvet beans are good hay plants where they are grown.

Georgia. C. A. WHITTLE.

BROWN SWISS

ANNOUNCEMENT

KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.

The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.

The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.

MARSH FARM - - - Waterloo, Iowa

EL JANE GUERNSEYS ARCADIA, MISSOURI
(85 miles south of St. Louis)

Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.

Mr. Farmer, Dairyman, or Breeder, anywhere, take notice!

BULL SALE — Since our last dispersal of bulls we have accumulated 7 that are now ready for any kind of service. We also have 6 calves. These animals are from high producing dams with records. Ten of these animals will go well in show ring. You will want one for fall service. We want to dispose of them NOW. Tell us the age you want, what you want to pay. We will send you pedigree and price list. Our proposition is 25% discount next thirty days on serviceable bulls, and 20% discount on calves. Also have several well bred young cows. Let us both make some money by buying NOW at the right price.

50 GRADE HEIFERS—Priced to Sell!

REGISTERED COWS and BULLS FOR SALE

We have at Larsen's Fern-Dell Farm a herd of 100 pure-bred and 200 high grade Guernseys. This is a herd where cows must be profitable producers,—one grade produced 17,555 lbs. milk, 887 lbs. fat in a year.

We now have for sale 50 grade heifers, many bred for early fall freshening, all from good producing dams. Will also price a few pure-bred females of milking age. The bulls we offer are from a few weeks to 14 months old and from A. R. dams. Wire us before you come so we can meet you.

LARSEN'S FERN-DELL DAIRY FARM, A. W. FOX, Mgr., ONEIDA, WIS.

ANTON'S KING CONFIDENCE 4351

Traces six times to Claremont May Rose, the foundation cow of the great May Rose family, and his dam has a junior four-year-old record of 764 lbs. of butterfat.

Have we ever sent you a description of the bull calves we are now offering for sale? They sell very rapidly because our prices are within the reach of every dairy farmer.

A son of A. K. C. or a son of Bonanza out of a daughter of A. K. C. will build up your herd. Write for prices. Herd Federal Accredited.

Wabeek Farm Holsteins
Foundation Females For Sale
We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

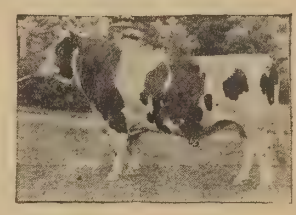
WABEEK FARM, Harry Mather, Mgr.
R. 3, PONTIAC MICHIGAN

Prince Echo Rauwerd 353211
Is being used in the Traverse City State Hospital herd on the daughters of his half-brother, ECHO SYLVIA KING MODEL.

Both of these bulls are sired by CHAMPION ECHO SYLVIA PONTIAC, best son of MAY ECHO SYLVIA, and sire of 14 daughters from 30 to 37.5 lbs.

The dam of PRINCE ECHO RAUWERD produced 34.05 lbs. butter and 688.6 lbs. milk as a Sr. 3-year-old.

His sire has ten daughters from 30 to 37.69 and her dam is a 30-lb. cow with a 365-day record of 1113.25 lbs. butter and 29,000 lbs. milk.



We are counting on the tremendous production back of him to show results.

His 6 nearest dams average 35.22 lbs. butter and 709 lbs. milk in 7 days.

Send for our list of bulls from Michigan State Herds.

Mention Hoard's Dairyman When Calling On Your Dealers or Writing Advertisers

Sweet Clover for Hay

HOARD'S DAIRYMAN:—In order to raise sweet clover more successfully where rank growths are so common, it is advisable to seed more to the acre. It has been a custom of seeding 8 to 12 lbs. to the acre, depending on the nature of the soil. If twice this amount is used, it will prevent the plants from rank growths. The stems will be fine and tall, making it very good hay. There will also be a greater yield, and this will somewhat offset the extra cost for seed.

This method of heavy planting is also beneficial in the sow thistle infected areas. The early cutting of the fields not only keep the thistles from setting seeds, but the thick growth will tend to smother and crowd out the thistles.

Observations throughout the northwestern part of the state of Minnesota clearly indicate that sweet clover should be seeded more heavily and, where it is seeded from 16 to 24 lbs. to the acre, a finer hay is produced and it will greatly check the sow thistle.

Minnesota. A. H. OLESBERG.

Select Seed Corn for Vigor

According to Minnesota Bulletin 210, "Methods of Corn Breeding", seed corn should be selected on the basis of vigor, without close attention to score card ear-type.

In "suggestions to farmers" at the close of the bulletin are the following statements:

"Corn seed should be selected from perfect stand hills and from vigorous, healthy stalks. Plants which are green when the ear approaches maturity insure normal maturity of the ear.

"Close selection for ear type leads to a reduction in yielding ability. For this reason no close selection to ear type should be made.

"Proper storing of seed ears is fully as important as methods of seed selection."

CHAPIN IOWA

Every female in the herd except one, has been bred on the farm.

FOUR DAUGHTERS OF SIR SADIE CORNUCOPIA

Positively the greatest group of daughters of one sire ever offered in an Iowa sale. Their records average practically 1,000 lbs. butter and their average weight is 1,850 lbs. From left to right they are—Sadie Fobes of H. F.., Sadie Whitebird of H. F., Sadie Cornucopia Whitebird and Sadie Gerben of H. F. They are the four highest record daughters of their sire.

SADIE CORNUCOPIA WHITEBIRD IS THE HIGHEST YEARLY RECORD COW EVER OFFERED IN AN IOWA SALE

IN THIS SALE
An 1100-lb. cow
A 1,000-lb. cow
Four others over 900 lbs.
Milk records from 20,000 lbs at 2 yrs. to 26,000 lbs. at full age.
A 36-lb. cow and her son.
Two sons of 1,000-lb. cows.
Four daughters of 30-lb. cows
Two daughters of a 1,000-lb. cow.

SOME OF THE FEATURES

SADIE CORNUCOPIA WHITEBIRD—1,109 lbs. butter, 26,000 lbs. milk, with her yearling daughter. Due soon after sale.

SADIE FOBES OF HOME FARM—1,016 lbs. butter, 24,240 lbs. milk, also 933 lbs at 4 yrs. A son and a daughter selling.

QUOQUE KORNDYKE SADIE VALE—35.96 lbs. in 7 days, 958 lbs. in a year. State champion for milk in sr. 3-yr.-old class. A son and daughter in the sale.

SADIE GERBEN OF HOME FARM finishing a record of about 930 lbs. butter. Dam of H. F. S. V. Empress. A baby daughter and seven heifers by her son selling.

SADIE WHITEBIRD OF HOME FARM—903 lbs. butter. 3 daughters on sale, one making a large 3 year old record.

HOME FARM SADIE VALE EMPRESS—805 lbs butter at 3 years. Now on test. 2 daughters in sale.

SOME OF THE BULLS

King Korndyke Sadie Vale 24th—the best transmitting son of K. K. S. V. for yearly and short time daughters combined. Home Farm Prince Fobes, a son of Sadie Fobes of H. F.-1,016 lbs. butter, sired by Woodcrest Sir Clyde. A son of Quoque Korndyke Sadie Vale—35.96. A son of H. F. S. V. Lorelia—her two heifer records averaging over 800 lbs butter and 21,000 lbs. milk.

Sir Sadie Cornucopia—with 4 daughters in the sale, is the best son of the first 30-lb. cow, Sadie Vale Concordia and is the sire of our four with 8 records from 30 to 36 lbs.. Woodcrest Sir Clyde, with 20 daughters in the sale, is the best son of Alma Clyde (33-lb. and 970 lbs. in 1912) and his 44 tested daughters include a 36-lb. heifer and several others above 30 lbs. with year records up to 1,000 lbs. butter and 25,000 lbs. milk. King Korndyke Sadie Vale 24th has two daughters averaging 34 lbs. and his first four to finish year records averaged 805 lbs. butter from 21,000 lbs. milk. Twelve of his beautiful daughters and 24 granddaughters in the sale.

QUOQUE KORNDYKE SADIE VALE
(To Be Sold)
a 35.96 lb. daughter of K. K. S. V. 24th with 958 lbs. in a year.

Chapin is located seven miles north of Hampton and 23 miles south of Mason City on the C. R. I. and M. & St. L. railroads; the Red Ball bus runs by the farm on the Glacier Trail and Jefferson Highway. Trains will be met and transportation furnished from Hampton the morning of the sale.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 13 Fort Atkinson, Wisconsin October 10, 1924

Hand Milking will soon be as Old Fashioned as Hand Harvesting

The De Laval Milker

is rapidly eliminating hand milking and has already done so on thousands of farms not only in the United States and Canada but in every dairy country of the world.

No one would think of harvesting grain in this day and age with a cradle, and yet a De Laval Milker will save more time in the course of a year than a grain binder or any other labor-saving machine on the farm. A De Laval Milker not only saves time twice a day, 730 times a year, but because of its stimulating and soothing action almost invariably causes cows to produce more milk than by any other method—either hand or machine—and in addition produces cleaner milk.

The Better Way of Milking

The De Laval Separator Company

NEW YORK
165 Broadway

CHICAGO
29 East Madison Street

SAN FRANCISCO
61 Beale Street

EASY TERMS: If you are milking 10 or more cows by hand you can soon pay for a De Laval Milker through the time it will save and extra milk of better quality it will produce. Sold on such easy terms that you can use it while it pays for itself.

FROM SCRUBS TO PURE-BREDS IN CANADA

A. H. WHITE, Department of Agriculture, Canada

SOME time back, I had the opportunity and the pleasure of visiting the excellent herd of the Wicklow Stock Farm, owned by J. G. Wait of Ontario. Mr. Wait's farm comprises about 175 acres and is pleasantly situated on the north shore of Lake Ontario about 80 miles east of Toronto and in the heart of one of the best apple growing districts in the province. There is a good apple orchard of considerable size that produces a nice income, but the dairy herd is the main revenue producer.

The most interesting feature of the herd is its history and transition from a common grade herd of low average production to one composed entirely of pure-bred animals with a fairly high average production. This fact is the more interesting because Mr. Wait has built up his herd by breeding and not by buying. The making over of this herd really started in the year 1911, when Mr. Wait became interested in keeping dairy records and checking upon each individual cow. Since that date a complete daily milk record has been kept of every cow that has been in the herd. This was before there was any kind of a cow test association in the community. In 1918, a cow testing association was formed and Mr. Wait has been an enthusiastic member every year.

If anyone had called at the Wait farm in 1911, they would have found just a common, ordinary bunch of grade cows of no particular breeding. Some of them were just cows and that's all. Today on this farm is a small but select herd of well bred Holsteins that are making fairly good profits in spite of the fact that milk prices are considerably lower than in the United States.

Keeping Records Did It

The change from a lot of nondescript grades with an average production of about 5000 lbs. milk to pure-breds averaging over 10,000 lbs. milk was not accomplished in one year or in two. Nor did it happen accidentally. In the dairy business it doesn't work out that way. It did come about, however, after a few years of careful weeding out of the poor cows, the use of good pure-bred sires, and attention to the main principles of good feeding. These better practices were made possible by having accurate information about each cow. As Mr. Wait said, "I would soon go out of dairying if I did not keep records." Naturally he is a booster for cow testing associations of any kind.

When Mr. Wait first started to build his herd he was a comparatively young man with no special advantages, except a vision of what he would like to have in the matter of cows, his determination and perseverance to that end, and a store of good common sense. The farm was no better than other farms in the community. His cows were on the same average plane as those of his neighbors and probably not as good, and he was not blessed with a lot of money with which to go out and buy high priced sires or cows of known high production. The herd has had to pay for itself as it went along, and as it improved Mr. Wait was able to buy better sires and spend more money on feeding.

The first year that milk records were kept, there were 14 cows in the herd. When the year's production for each cow had been totaled, Mr. Wait found that he had been keeping three cows under the 4,000-lb. mark. The average for the whole herd was 5,438 lbs., with a high individual production of 7,150 lbs. The net result of the first year's testing was the sale of seven of the original herd and the inclusion of four new animals.

This change brought the average production over the 6,000-lb. mark with an increase of nearly 800 lbs. per cow, but there were some boarders among the new cows. These in turn were disposed of immediately when they were found out and replaced by others. At the end of the third year of testing, the average of the herd jumped another 700 lbs. per cow, and during the year of 1914 the average of eleven head was 8,241 lbs. milk, including the records of three young heifers that were in the herd for less than eight months. This increased production of nearly 3,000 lbs. milk per cow was the result of weeding out the poor cows together with a little better feeding. It amply justified the extra time and trouble it took to weigh the milk morning and night.

The highest average production was reached in 1918 when there were only 8 mature cows in the milking herd. The average in that year was 12,559 lbs. of milk and 439.0 lbs. fat. Four of these cows were pure-breds and the others were grades. Since 1918, there has always been a number of young heifers in the herd but Mr. Wait has managed to keep the average production over the 10,000 lbs. per cow. This is a difficult thing to do, as most dairymen know, for the higher the production the harder it is to increase production, and the sires must be better if any improvement is to take place.

DELLA OF WHITE GABLES, THE FIRST PURE-BRED COW PURCHASED BY MR. WAIT IN 1913

In ten years she has produced over 100,000 lbs. milk.

The Start in Pure-breds

After the first two years Mr. Wait thought that anything worth doing was worth doing right, so he purchased his first pure-bred cow, Della of White Gables. The old cow is still in the herd after eleven years of service and seems to be going as strong as ever. In her first eight years she produced over 100,000 lbs. milk in spite of the fact that in 1920 she had garget trouble that left two quarters of her udder practically useless. In 1917, another foundation cow was purchased and her total production for the first four years was 54,656 lbs. milk and 2,073.8 lbs. fat. At the present time the milking herd of about 17 cows is composed of these two cows and thirteen of their daughters and granddaughters.

When the time finally came to change entirely to a pure-bred herd a few real good grades had to be sold. Two or three had produced on an average of over 11,000 lbs. per year over a period of five to eight years, and were living examples of the value of the pure-bred sire.

During these years a few good daughters of the first foundation cow had come along. Her first daughter, Kate of Roselawn, started out with a record of 14,258 lbs. milk and 487.3 lbs. fat, and for her first four years had an average production of over 14,000 lbs. milk and 500 lbs. fat. Another daughter, a full sister of Kate, made 10,700 lbs. milk and 403.9 lbs. fat in her first year and 15,290 lbs. milk and 569.0 lbs. fat the second year. And hereby hangs a tale of a good bull sent to the butcher before his daughters were tested and his value known. These records are based on what these cows had given in each succeeding calendar year.

Some Good Official Records Were Made

Having found that he had some cows that had possibilities for some good official records, Mr. Wait put three cows on Record of Performance test in 1921. In the 365-day division, Kate of Roselawn made 17,031 lbs. milk and 608.0 lbs. fat, while her sister made 11,183 lbs. milk and 427.0 lbs. fat in the 305-day division. The other cow in the herd made 15,000 lbs. milk and 553.0 lbs. fat in 365 days. These performances led on to the strictly official seven- and thirty-day tests.

In 1922, although only dry for a period of three weeks, Kate was put on test and she was in pretty fair shape as Mr. Wait was a good feeder. However, this was something new, as feeding for seven-day tests is quite different to feeding in the ordinary way. Mr. Wait made a good job of it in spite of inexperience and he had the pleasure and great satisfaction of seeing this cow make a record of 741.7 lbs. milk and 32.89 lbs. butter in seven days. Her high milk production for one day was 112 lbs. milk. This record attracted the attention of a breeder who had made a specialty of these short time tests and Kate was immediately sold for a pretty good figure. Under more experienced hands she went right on and made a record of 855.4 lbs. milk and 37.02 lbs.

IT is difficult to appreciate how rapidly tuberculosis eradication work has developed in this country. Prior to 1918 and before there was adopted a uniform plan for tuberculin testing of cattle, the work of tuberculosis eradication moved forward rather slowly. During the twenty or more years that tuberculin testing was being carried on by a few breeders and stock raisers, the necessary knowledge for laying systematic plans of handling herds suffering from tuberculosis and methods of tuberculin testing were being learned. The tuberculin testing of herds here and there did not produce the results comparable to area testing, but it laid a foundation for the plan now under operation and which is meeting with approval and success.

When the plan was adopted for carrying on tuberculosis eradication work under the supervision of the state and federal governments, there were many who wondered just how rapidly the stock raisers of this country would desire to place their herds under governmental supervision. The illustrations on this page showing the growth of the work since 1918 to 1923, inclusive, visualizes, to some extent, how rapidly the sentiment in favor of the tuberculin testing has developed. It does not tell the whole story.

The number of herds which have been tuberculin tested are 585,522 containing 5,222,047 head. Thte total number of accredited herds are 51,-262 containing 956,178 head of cattle. The total number of herds under supervision are 775,758 containing a total of 8,047,645 head. The total number of herds on the waiting list are 246,602 and contain 2,659,320 head.

More work would have been done and a great deal more accomplished if the state and federal governments, had been given larger appropriations. We rather favored moving forward slowly in this splendid work, for we fully appreciate adopting sound methods of procedure, the necessity of well-trained men being in charge, and the development of public opinion in favor of tuberculosis eradication. We do believe we have developed a sound system of handling herds containing diseased animals and have well-trained men to carry on the work. In view of this, larger appropriations can be made by the state and federal governments and the money will be economically expended. Those in charge of tuberculosis eradication work, both in the federal and state governments, should be congratulated upon what they have been able to accomplish. The live stock raisers are to be commended also for the splendid co-operation they have given in carrying on plans for eradicating tuberculosis from their herds and flocks.

Langwater Ultimas and Five of His Daughters

WESTVIEW SUZETTE
Record: 11,144.7 lbs. milk, 652.86 lbs. fat—Class G.

GUERNSEY BULL, LANGWATER ULTIMAS
Purchased by F. J. Reuping, Wisconsin, for $10,000 at the Westview Farm Dispersion Sale.

WESTVIEW BUTTERCUP
Record: 10,814.9 lbs. milk, 605.97 lbs. fat.

WESTVIEW EULALIE
Record: 12,058.5 lbs. milk, 684.41 lbs. fat—Class FF.

WESTVIEW YVETTE
Record: 11,631.6 lbs. milk, 649.17 lbs. fat—Class F.

WESTVIEW BERNICE
Record: 12,515.7 lbs. milk, 607.92 lbs. fat—Class G.

The first six daughters of Langwater Ultimas to be tested, all with first calf, averaged 11,514 lbs. milk, 626.5 lbs. fat, a record for the breed. All of his tested daughters—ten—averaged 587.9 lbs. fat as first calf heifers. These same ten sold for an average of $1,237. Twenty-four of his get sold at the Westview dispersion for an average of $893.

A Tarheel Co-operative Creamery

F. H. JETER, NORTH CAROLINA

A SINGLE co-operative enterprise within the town of Mooresville in Iredell County, North Carolina, has taught the entire community the value of co-operation. This is the Mooresville co-operative creamery owned and operated by 198 stockholders, mostly farmers of the surrounding territory. The plant converts into rich, yellow butter the cream from 1085 farmer patrons, paying out to them last year $134,494.52 for the butterfat bought. There are 208 shares of stock in this co-operative enterprise which sold originally for $25 per share. A shareholder is not so greatly favored except that he controls the policies of the creamery. He gets only one cent per pound more for his butterfat than that paid to an ordinary patron. In case he owns a large number of producing cows this one cent premiums means much to him, otherwise not.

This co-operative enterprise, according to an audit of its business for the fiscal year ending June 30 of this year, did a volume of business amounting to $160,403.96. This was the amount received for the butter and buttermilk sold.

The creamery was hard pushed once or twice during the year to supply its trade, making it necessary to buy 7,767 pounds butter from outside sources. The total amount of butter sold during the year was 353,383 pounds—all of it a high class, fine quality product made by an experienced and well trained buttermaker and shipped in modern containers to the ultimate consumer.

The average price paid by the creamery to its patrons for butterfat was 48.2 cents per pound as against 45.2 cents for the year before. The average selling price of the butter was 45.2 cents per pound as against 42.7 cents for the previous year. The increase in production over the previous year amounted to something over 8,000 pounds.

"But we had a hard time getting fully established," said the grizzled secretary-treasurer, Mr. J. A. Stewart, himself a farmer and generally recognized by those who know as the man who has done most to make the enterprise successful. "Yes, we had a hard time. I put my own money into it time and time again during the first few years to keep it under way. We first began as a small group selling cream to a creamery located in another town. This group we used as a nucleus and in 1914 we organized the present creamery.

"It didn't look like it does today either. Of course we began on limited equipment. We had the brick building located on this excellent lot, but we didn't have much inside. The ceiling wasn't in, nor was much of the equipment that you see here today. But we have built gradually and surely, adding to our equipment and staff as we could and always playing fair and square with our patrons and stockholders. Now we are established. Except for a small surplus of butter early in the spring when the pastures come in, we are hardly ever able to fill all orders sent us, but we never lower our quality or standards to simply fill orders.

"Here about us is a good farming country with good farmers and fertile lands. We have good pure-bred cows from which to draw our butterfat supply and these cows graze on clover and excellent pastures which when supplemented with plenty of other feed, help to make good butter."

A SUCCESSFUL CREAMERY IN NORTH CAROLINA

The creamery is located at an advantageous place near the railroad in the business section of Mooresville. The lot next door belongs to the organization and will permit of expansion whenever conditions justify. The building is of red brick, the floor of concrete, and the walls and ceiling are painted a spotless white.. Screens keep out the unwelcome flies and a steam boiler furnishes live steam to destroy any malignant germ that may have designs on the health of some one who eats the butter. There is a cooler room with two power machines ready to keep the temperature at any low degree desired. Two tremendous churns are at one side and a battery of pasteurizers, ripeners, and coolers are to another side. On a concrete table at the receiving door are the scales for weighing each patron's cream as it comes in from the route. Here also are the sampling bottles and the other small paraphernalia needed in any modern up-to-date plant. The stock of containers for shipping the finished product is kept in a small room at the back and a clean table in front furnishes a packing place as the fresh, firm butter is brought from the refrigerating room to be packed for shipment.

Nearly everything is done by machinery except the actual packing of the butter into the little pound boxes. But even then it is wrapped in wax paper and the hand hardly touches the finished product. Two clean-cut young men cut the butter with the patented contrivance that

ANY one who has anything to do with the management of fairs or cattle shows can learn a lesson from the Dairy Cattle Congress. Established in a country that is far from being a good dairy section and without paying large premiums, Manager Estel and the other men responsible for the management of the show have made it one of the most successful held anywhere.

Every year finds an improvement over the previous one. It was so this year. The 1924 show held Sept. 22—28 had more cattle than in 1923, more commercial exhibits, and a very much better attendance. Increased barn space has been provided for the cattle and while this will no doubt have to be further increased in the future, the great need now is for a larger exhibit building that will better accommodate the commercial exhibits and the crowd that is there to see them. Another year as successful as 1924 should make this possible.

One of the good educational features this year, and possibly it is one that many missed because it was in a building just a little away from many of the others, was the cow test association and government exhibits. The latter, quite similar to that put out by the Department of Agriculture every year, occupied about a third of one of the new barns and any one who studied the lessons it pictured could not but learn something of the do's and don'ts of dairy farming.

The cow test exhibit featured a scrub bull, in a box stall, labeled "A cow freshener, not a bull", and over it an axe and a placard with the admonition "Use the axe and avoid financial suicide". Proof of the necessity of this was found in a group of cows nearby. One was a typical scrub with no record and nothing about her to indicate that it would be possible for her to make even a poor one. Next was one that was fed at a loss and beside her one typical of the average cow of Iowa. She produced 135 lbs. of fat at a net profit of $8.12, a fine return for investment and labor. Above her were three *dairy cows* with records from 318 lbs. to 508 lbs. of butterfat. These cows that had made profits for their owners of as high as $170 in a year, were the best of proof that in the dairy business it pays to breed and feed intelligently.

The Junior Show

The calf club show this year was far and away the best ever seen at Waterloo and those in charge of such events tell us it was one of the very best of the year, the quality of calves shown being especially good.

There were 77 Holsteins, 23 Guernseys, 15 Jerseys, 6 Ayrshires, and 6 Brown Swiss, and when they were out for judging on Wednesday it made quite as interesting a show as any of the week. John Wilcox of Jones Co., Iowa, showing a yearling Holstein heifer, was awarded grand champion showman honors.

Students' Judging Contest

With twelve teams competing, Wisconsin, tenth in last year's contest, showed a complete reversal of form and finished in first place with 1,548 points, 47 points ahead of Ohio in second place. Below them were the teams from Illinois, Nebraska, Minnesota, Texas, Ames, Kansas, North Dakota, Missouri, Purdue, and South Dakota placing in the order named.

The Wisconsin boys piled up their lead of points by finishing first as Holstein, Guernsey, and Ayrshire judges. Texas did best with Jerseys and Ohio won on the Swiss.

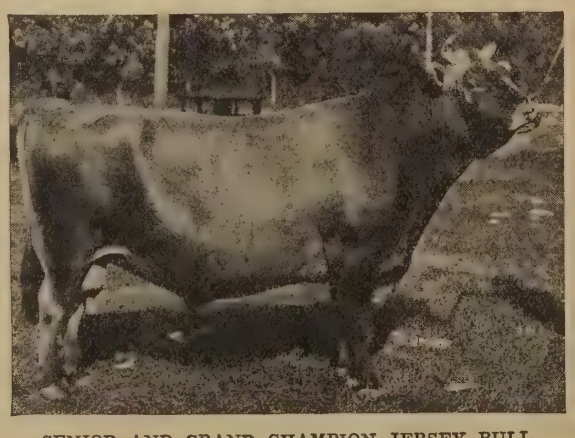
Geo. Kloser of Wisconsin was the best individual judge with a 560 score. He rated as the best judge of both Holsteins and Ayrshires, took second place in judging Jerseys, and third with Guernseys. J. B. Ball of Illinois and Geo. A. Mark of Iowa went to second and third places in the individual scoring.

FARCEUR'S CIVETTE, JUNIOR AND GRAND CHAMPION MARE
OWNED BY C. G. GOOD & SON, IOWA

Junior Judging Contest

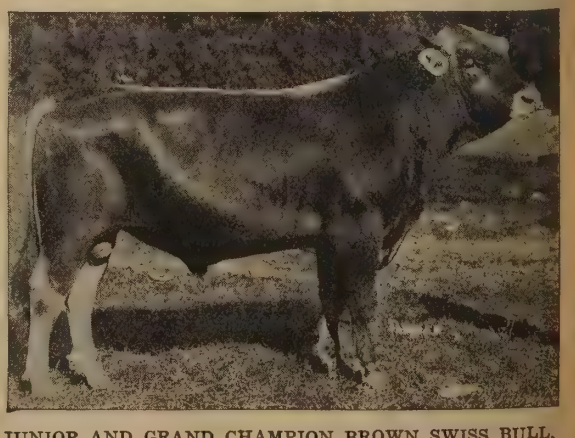
The junior judging contest this year was a winner. Twenty-one teams representing Iowa counties competed for state honors with Franklin first, Fayette second, and Clayton third.

Robt. Stewart was the best judge of all and next to him were Harlon Leonard and Gertrude Kaiser in second and third places respectively.



The Dairy Cattle

The cattle show at Waterloo was larger than that of a year ago and with most of the breeds it was of fully as good quality if not better. Two new cattle barns have been added since last year, which, together with those built earlier and the old, main barn, took care of the entire 775 head nicely. The only disadvantage is the long lead from some of them to the arena and the fact that being a little scattered, as they are, does not make it so convenient for show visitors to see them all.



The show included herds from South Dakota, North Dakota, Iowa, Minnesota, Wisconsin, Illinois, Indi-

New "Z" Engine prices 19% below 1913 level

"Z" engine prices are lower than farm product prices *today*. Horsepower for horsepower, you can buy the famous "Z" with fewer bushels of wheat, fewer pounds of cotton, fewer hogs—than were required to buy the Fairbanks-Morse engine of 1913.

Remember, this is a genuine "Z", famous for its dependability — its economy. More than 1,250,000 horsepower now in farm service. Quantity production, engineering skill and careful manufacture have been combined to give you a better engine at a lower price. Investigate—See the Fairbanks-Morse dealer in your town.

TODAY'S PRICES:

1½ h. p. Battery Equipt $48.50	3 h. p. Magneto Equipt Uses Kerosene $98.50
3 h. p. Battery Equipt $83.50	6 h. p. Magneto Equipt Uses Kerosene $153.50
1½ h. p. Magneto Equipt Uses Kerosene $58.50

"The best show that I've seen this season," was the way the judge characterized the Holstein showing and every one present agreed with him. More than that it was the best we have ever seen at Waterloo. There were 201 head from six different states and in a majority of the classes practically all of the ribbon winners were good ones, with plenty of close decisions to be made. In that connection it is worthy of note that regardless of the closeness of the decision, when the reasons for such a decision were given, there was a noticeable lack of criticism of the judge. His work was, we think, very acceptable to both exhibitors and audience.

Twenty-five aged cows made one of the best classes of the show with Zwingara Segis Clothilde, owned by the Modern Woodmen Sanatorium, the outstanding member of the class. She is a true dairy cow with the top, rump, veining, and udder that would catch every breeder's eye. She is very good as it is and with just a little more size would be very hard to beat in any ring.

Of the four-year-olds perhaps the less said the better—it was not a good class. The three-year-olds were much better, with three that every one recognized as entitled to the top places—Madam Artis Wayne Denver owned by the Jefferson County Asylum, Maudline Ollie Homestead from the Minnesota Holstein Co. herd, and Mankato O. K. L. Blanche entered by Marlow and Randall. While any or all of them may, before this appears, be beaten at the National, they are undoubtedly the three best that have appeared in any ring thus far this season. The first heifer is altogether too heavy at the shoulders and carries a little too much flesh elsewhere, but she has an advantage in udder capacity and rump that kept her at the top. The Minnesota Holstein Co. entry, while she appeared to have the poorest udder of the three, was considerably better than

EDITORIAL COMMENT

THE U. S. Dept. of Agriculture states the last case of foot and mouth disease reported in California was disposed of August 23rd, making an entire month of no new outbreaks of this disease. The government is still watching very closely the premises on which foot and mouth disease occurred; also the range country and forest sections.

The elapse of one month without any new outbreaks of foot and mouth disease is encouraging, but it is well the government officials should be alert for any infection which may have escaped them.

ACCORDING to the U. S. Department of Agriculture, the per capita consumption of milk and cream has increased about 12 per cent during the past ten years, and the per capita consumption of butter more than 6 per cent. This condition has undoubtedly been brought about by educational campaigns advising the consumer of the food value and necessity of milk and its products. The results of investigations to determine the part that milk plays in the human diet for growth, health, and development have caused people to modify their diet and to use more dairy products. We would be a healthier and stronger people if the consumption of dairy products were doubled.

THE EROSION PROBLEM

Many farmers fail to recognize they have an erosion problem unless their fields are gullied. It is quite possible that sheet erosion, which takes place all over the hill, may carry away more fertility even than where the water gullies out the field.

The Illinois College of Agriculture recommends terracing as the most effective method of controlling this erosion. The type of terracing it suggests checks the flow of the surface water, thereby preventing soil washing and assists in the maintenance of the productive capacity of the soil. Such terraces after being built are not difficult to maintain and their cost should not exceed two dollars an acre even where the labor must be hired to do the work. It is said that these terraces do not interfere with the usual farming practice.

For those who are interested in this problem, it would be well to write the College of Agriculture, Urbana, Illinois, for a copy of Circular No. 290, entitled, "Saving Soil by Use of Mangum Terraces".

WORK DEVELOPS MEN

Whenever a census is made to determine the birthplace of the leaders in industry, in statesmanship, and in various other activities of the city, it is invariably found that a large majority of them were born on the farm. There is nothing in the inheritance of farm-born men to make this difference. The people of the city and of the country have a common ancestry. It is quite possible the city has a higher percentage of shiftless and ne'er-do-wells than the country. The city life is simpler and easier. The factor which contributes so much to a successful man lies, we believe, in having an early experience with work. The boy at a very early age is taught to do some useful thing and is given a responsibility. This early training, to us, is of immeasurable value because it develops tenacity, determination, and initiative, which are all essential in directing any worthwhile enterprise.

Mr. T. H. Beacom, receiver of the Denver & Rio Grande Western Railway, recently stated in an address: "I was fortunate in having spent my youth on the farm, and while my opportunities for schooling were limited, taken between crops, I learned one thing that I have never forgotten; I learned how to work hard and from early dawn to late at night, and I sometimes think that we would fare better if our youngsters of today worked more and played less."

NATURE'S PERSISTENCY

We have been much interested for several years in watching the persistency with which certain grasses in lawns modify their form and habits to accommodate themselves to changed conditions and environments in order to accomplish their purpose. The grass on these lawns is cut frequently, thus preventing it from attaining the usual growth preparatory to flowering and seeding, but nature, strong and unyielding in its purpose, which in the case of plants is to produce seed, has developed a form, particularly in Kentucky bluegrass and less markedly as yet in timothy, which defies the lawn mower; the little seed heads are so close to the ground.

We realize, of course, that this is only another manifestation of the general law that plants observe in becoming acclimated, but its occurrence under our own observation and in so brief a time has had the effect to strengthen and confirm our belief in its wider application. If the plant, in successive generations, develops a habit of growth and takes on a form in harmony with its environments and the new demands made upon it, why is it not reasonable to expect that the animal will do the same? There is a much closer correspondence between the laws which govern vegetable life and animal life than we are accustomed to realize, and the points in common in animals of various species probably far outnumber those in which they differ.

If, then, the grasses of the lawns and fields, no less than the beasts of the forests and farms, when subjected to the demands which man makes upon them for his profit or his pleasure, can and do so materially modify and change their original forms and habits, why is it that so many of us continue to insist upon rearing thistles when we want grapes; that is to say, upon breeding for beef when we want milk? Why not accept the teachings of nature and aid, rather than attempt to thwart, her efforts to adapt form to purpose?

A POOR FARMER

All summer long we have been watching a corn field being taken care of by a certain farmer. We have studied his methods of cultivation, the time he spent in the field, and are led to the conclusion that if corn were to sell at $5 a bushel, this farmer would not get a return of 25c an hour for his labor.

This particular incident is one of the best examples of poor methods of farming, inefficient understanding of how to handle a corn field, we have ever observed. We have seen men plant corn and neglect to cultivate it. This man did not do that. He has worked hard—so hard that he is dull. He hasn't time to read. He is too busy trying to hoe and cultivate his poor crop of corn. He cultivates, and he hoes and still the weeds are nearly as vigorous and strong as the corn. There is no great lesson in this particular field of corn or this farmer. It does reveal, however, very emphatically that it requires skill to know how to handle a corn field or any other kind of field. It also shows that some men are not adapted to being farmers. Our sympathy always goes out to such men and we are led to wonder how they manage to hold on to their farms when they exercise so little skill in their operations.

COUNTIES PASS T. B. LAWS

Eight counties of southern California have passed a tuberculosis ordinance, the purpose of which is to assist in the eradication of bovine tuberculosis. No cattle are permitted to be shipped into any one of these eight counties, except for immediate slaughter, without obtaining a permit from the county live stock inspector. They must be accompanied by a certificate signed by a federal, state, or county veterinarian, live stock inspector, or similar officials.

Immediately upon the arrival of cattle in any one of the counties the fact must be reported in writing to the live stock inspector. No person shall be permitted to inject tuberculin in any of the cattle brought into these counties for a period of 120 days.

An ordinance of this character should be supported by every dairy farmer who is attempting to eradicate tuberculosis from his herd. There is little use of going to the expense and labor of applying the tuberculin test and eradicating reacting animals from a county unless some provision is made to prevent the shipping in of diseased animals. We can not exercise too much care in handling territories attempting to get rid of tuberculosis.

OLEOMARGARINE PREMIUMS

To induce the dairy farmer to use oleomargarine, a manufacturer of oleo offers an extra heavy, twelve-quart milk pail as a premium. This pail can be obtained by saving the cartons from twenty pounds of oleomargarine. The offer reads as follows:

"To induce you to become a user of —— —— margarine, we will give free of all cost to you one 12-Quart Dairy Pail.

"All you have to do is to *Save The Empty Cartons* from 20 pounds of —— —— margarine.

"Bring them to our store and we will give *Free* one of these useful *Pails*. If purchased in the regular way it will cost $1.00."

We presume some dairymen will accept this offer and will milk their cows this winter in the milk pail offered as an inducement to dairy farmers to eat oleomargarine.

From such farmers we will hear the greatest complaint regarding the prices of dairy products although by their action they have helped to reduce the price of butter. It is their privilege, of course, to eat oleomargarine if they desire to do so, and it is also their privilege to complain. But it is likewise the privilege of others to condemn their folly and to point out their inconsistency. If a dairy farmer will not consume his own product he has no just basis for complaining about the prices of dairy products.

THE RADIO AND ITS OPPORTUNITY

No invention has meant more to farmers from the standpoint of entertainment, recreation, and contact with the affairs of the world than the radio. Since it has been perfected and various radio stations established for sending out programs of entertainment, news, and information, farmers have purchased radios by the thousands. It is estimated by the United States Department of Agriculture that more than 370,000 radio sets are in use on farms, as compared with 145,000 a year ago. This indicates the farmer appreciates the radio and the service it renders him. It brings him in contact daily with the world affairs, providing him with entertainment and interesting news.

It has been pointed out that the radio will be a large factor in correcting erroneous reports which are made by so many of our daily papers. There is much false propaganda being disseminated among the people of this country and if those who have established radio stations will be careful to distribute useful and accurate news and information, as well as entertaining programs, the radio will have one of the largest influences in developing this country that has ever been discovered. The American people inherently desire to be right and they can be trusted upon all issues if they can only get a proper understanding of them. We are living in a time when a great many newspapers and various other agencies and independent individuals are appealing to the prejudice of the public mind rather than to reason. It is our sincere desire that those providing the programs for the radio will exercise the greatest care to disseminate accurate and useful information. This country cannot survive if prejudice takes the place of reason.

Bran Would Improve Ration

Kindly give me a ration for good production from the following: Alfalfa, soy bean hay, clover hay, corn silage, corn and cob meal, oats, oil meal, and cottonseed meal. I have a mill for grinding my own grain and hay. If necessary, I can get bran in addition to the above.

Port Deposit, Md. J. T. C. H.

It is an easy matter to make a good ration of the feedstuffs on hand. When the roughage is made up of legume hay and corn silage, it is rather difficult to make a ration that would not be very satisfactory and produce good results. It would be our suggestion that every cow be given daily 30 pounds of corn silage, or about three pounds per 100 pounds live weight, and all the alfalfa, soy bean, or clover hay she will consume.

A mixture consisting of 400 pounds corn and cob meal, 300 pounds ground oats, 50 pounds oil meal, and 50 pounds cottonseed meal will supplement the roughage well. It will require about one pound of this mixture for each three and one-half pounds of milk produced. The addition of 100 pounds bran to the mixture we have suggested would improve it to some extent. Whether it should be added would depend almost entirely upon the price of bran.

Sweet Clover on Low Land

My farm consists of rather low land and in wet weather with cows tramping it up it would not be long before the field would be much more than mud. Would sweet clover survive under these conditions? Then, too, I understand a fresh pasture or a fresh seeding must be prepared each year. Is it possible to sow seed each year in an old pasture so as to make it a little more permanent?

Western Springs, Ill. S. G. M.

Sweet clover will stand much more wet than will alfalfa; in fact, in the western part of the country you see it growing on the banks of the irrigating ditches close to the water's edge. It will not be successful in a real slough pasture that is wet a good part of the season, but I have known it to be a success in a low pasture in McHenry County that is so wet it has never been plowed.

If your pasture is like the latter and you once get a good stand two successive years and then allow some of it to go to seed each year, you should have a continuous pasture.

If you do not wish to raise any kind of small grain to get a sweet clover pasture started, I would suggest that you sow the sweet clover alone; or, perhaps better still, with a thin nurse crop of oats, and turn the cows on when this is about a foot high. It is usually two months after sweet clover is sown in the spring before it should be pastured. W. J. FRASER.

Illinois College of Agriculture.

Sweet Clover on Western Pastures

We are milking fifty cows. Our pasture, containing about 100 acres is poor and gives us very poor results. As near as we can tell, it contains simply native grasses and weeds. There is good growth all summer but the cows do not relish it. They fill up on it, however, and keep in fairly good condition but the milk production is very low.

We plan to plow and reseed at least 50 acres of our pasture this fall. Do you recommend the exclusive use of sweet clover?

Cockeville, Wyo. N. & T.

Much of the old prairie grass in the western great plains is losing its original grazing capacity because of the encroachment of weeds. Overgrazing has undoubtedly contributed to much of this weed encroachment.

During the past month I have seen many fields, in the western Dakotas, badly infested with gumweed and similar pests. A good sweet clover pasture can be established on this kind of land. Eight to ten pounds per acre of biennial sweet clover seed seems to be about the right amount to use. If seeded alone, it should establish itself well, provided the seed bed is firm and reasonably clean. Sweet clover, however, has a greater ability to fight weeds and establish itself on weedy land than any other type of pasture crop.

Some prefer the biennial yellow sweet clover. It has the advantage of earliness in the spring, but it is distinctly earlier maturing in the fall; so much so that the white blossom sweet clover would seem to be preferable because of the greater length of grazing season thus obtained.

In order to have pasture land available all the time, there needs to be at least two pastures—one of the biennial sweet clover in its second year of growth during which year it will furnish the greatest amount of pasture but which will become rather short in the late fall. There should then be available a new seeding of sweet clover for this late fall pasture. Sweet clover is a biennial so that time must be allowed for it to grow up large enough so that it is safe to graze without material injury to the plant.

Where rainfall is less than 15 inches, sweet clover will ordinarily establish itself better without the use of a nurse crop than where a nurse or companion crop is used. H. L. WALSTER.

North Dakota College of Agriculture.

Silo Bacteria

We find in agricultural papers that the use of silo bacteria is recommended in filling silos. If you have any literature dealing with this subject, and from which we could secure some information on silo bacteria, we would be pleased to have you send us same.

Philadelphia, Pa. S. W. E.

So far as our present information goes, there is no advantage in using the so-called silage bacteria for the preservation of silage, particularly where corn is ensiled. It is our opinion that farmers will do much better to see that their silos are in good condition and that the silage is well packed than to spend time and money in adding lactic acid forming bacteria to the corn. The corn already carries a large number of the bacteria and they will increase in sufficient amount for preservation purposes if the silage is properly put into the silo. In addition to bacterial action, there are also physical and chemical changes in the plant cells that play an important part in silage preservation.

The claims sometimes made that the lactic acid bacteria fermentation will inhibit or prevent the formation of alcohol in corn silage is not well founded. In addition, in the ordinary changes that go on in silage, not over one-half of one per cent of alcohol is formed. Even if the formation of this amount of alcohol could be prevented, the nutritive value of the silage would not be materially changed.

Semi-solid Buttermilk

We wish you would advise us what is the process of manufacture of semi-solid buttermilk and what is the equipment required?

Muskogee, Okla. W. N.

Semi-solid buttermilk, also called concentrated buttermilk, may be made in one of two principal ways, namely, by mechanically removing some of its liquid portion, or by evaporating a portion of its water.

Concentrating buttermilk by removing a portion of the whey: This is accomplished by permitting the curd in the buttermilk to settle by gravity and then drawing off and rejecting the whey. In this case the fluid buttermilk is conveyed into a wooden tank, either a horizontal vat or a vertical stave tank. The tanks usually contain several outlets or gates located at different heights so as to facilitate the removal of the whey as fast as the curd settles. The tank is usually equipped with a steam pipe for heating. The buttermilk is heated to the boiling point in these tanks, either by blowing live steam into it or by running steam through the pipes installed into the tank. The heat is maintained for several hours. This causes the curd to contract, become heavier, and settle to the bottom in the form of fine particles, leaving a clear whey on top. This whey is drawn off through the gates located above the stratum of the curd. The residue, consisting largely of casein, albumen, lactic acid, mineral matter, and a small amount of milk sugar and water, represents the condensed buttermilk. The concentration or, more correctly speaking, the reduction in volume thus accomplished is at the ratio of about 4 to 5 parts of fluid buttermilk to one part of condensed or semi-solid buttermilk.

It is obvious that in this form of concentration all of the valuable food elements contained in the original buttermilk are not reclaimed. Most of the milk sugar and much of the lactic acid escapes in the whey and are lost. However, the equipment required for this process is simple and inexpensive and the process requires no special knowledge on the part of the creamery personnel. Unless previously ripened to a high acidity, this type of semi-solid buttermilk does not keep well at ordinary temperatures. If stored at all, it must be stored in the cold.

For many years, efforts have been made to remove the whey from the buttermilk by centrifugal separation. Machines are now on the market and in use in which the curd of the buttermilk collects on the walls of the revolving bowl or basket while the whey is centrifuged out. These machines are similar in principal to the well-known laundry centrifuge. They have been successfully used by creameries that are engaged in the manufacture of buttermilk cheese. Their operation, however, is intermittent only. When the basket fills up with curd, the machine must be stopped and the curd removed.

For the purpose of handling large volumes of buttermilk daily, these centrifuges are obviously not well adapted. They are too limited in capacity and in speed and volume of performance. Efforts to devise a centrifuge for continuous operation, similar to the cream separator, have so far failed. The specific gravity of the curd in the buttermilk is so nearly like that of the whey that the centrifugal separator refuses to discharge a liquid rich in curd through one spout and a liquid of practically clear whey through a second spout.

Condensing buttermilk by evaporation of water: In this case none of the valuable solids of the original buttermilk are lost. The only ingredient removed is the water of the buttermilk. This can be done either by atmospheric condensers or by vacuum condensers. The great bulk of semi-solid buttermilk that reaches the market today is manufactured by evaporating a portion of the water from the buttermilk in the vacuum pan, and the buttermilk is concentrated until its solids content amounts to about 28 to 30 per cent. In order to make the semi-solid buttermilk keep, it is necessary to ripen it sufficiently to have the finished product contain not less than 3.5 per cent acid. This ripening is usually done at a temperature from 80 to 90 degrees F. and it is facilitated by blowing air through the buttermilk. The ripened buttermilk is heated to the boiling point and then drawn into the vacuum pan where it is condensed to a semi-solid fluid, after which it is filled into barrels.

The equipment needed for this work consists of one or more buttermilk storage tanks, a vacuum pump and vacuum pan, one or more hot wells, a steam supply at the rate of 150 H. P. boiler capacity, for condensing about 5,000 lbs. of buttermilk per hour, and a water supply for the same volume of buttermilk of about 125 gallons per minute.

The manufacture of semi-solid buttermilk by evaporating a portion of its water in a vacuum pan must be done on a fairly large scale in order to be fairly economical and profitable. It is estimated that a creamery should have an output of from two to three million pounds of butter a year in order to make it worth while to install and operate a buttermilk condensing outfit.

Illinois. O. F. HUNZIKER.

Cows Don't Give Down Milk

We have a dairy farm of 360 acres and milking 65 cows. We want to, and expect to, be milking 100 by this time next year. We use a milking machine and have a lot of trouble with the cows holding up their milk. We wanted to ask you if other people had the same trouble and is there anything we could do to prevent this? We have been using the milking machine three years and seems as though we have had more trouble this year with them holding up their milk. We began feeding about one-half to a gallon bran to each cow just as we would put the milker on. That helped some for awhile but didn't last long. Do you think it a good idea to rub their udders or fool with them in any way when we put the milker on to try to get them to give their milk down?

Fort Scott, Kans. B. L.

The difficulty mentioned is not at all uncommon. It is especially common for cows to hold up their milk in the latter part of the lactation period, or when they are giving only a small quantity of milk. It is at this time that a little care and a little patience will make machine milking a success while if the machine is put on the cow and operated as though the cows were inanimate, the cows may hold up their milk and, therefore, dry up earlier than they should. Some may even get swollen and diseased udders.

The milker should always see that the milk is given down before the milking machine is attached, and the idea stated by the correspondent "to rub the udders and fondle with them" is excellent. It should always be practiced before the machine is attached, especially with cows that are inclined to hold up their milk.

Heavy milkers as a rule give down their milk immediately when preparations for milking are being made. Some give down their milk when they hear the milking machine start. But a cow that is not a full milker does not give down her milk so readily. No milking machine, nor any other artificial force, can draw the milk from a cow if she "wills" to hold her milk, and there is no need of attaching the machine if the cow does not give down her milk. C. LARSEN.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Nebraska's Dairy Program

HOARD'S DAIRYMAN:—Presidential candidates travel in special trains throughout the country, but out in Nebraska pure-bred dairy cattle are considered of even greater importance despite the fact that the vice-presidential candidates of the two leading parties are claimed by the state. This is no ordinary freight train to haul cattle from one place to another, but a real special with complete equipment and a special crew.

The idea of the train goes back to the time Nebraska was suffering from the post-war depression. Business was depressed because agriculture was not prosperous. Agricultural leaders sought ways and means of relief and also means of preventing further troubles of this kind. Chief among these was a plan for more diversified farming. This included greater interest in dairying or, as it is sometimes expressed, in milking cows. Nebraska farmers need a steady income week by week that will bring in a little cash to at least pay grocery bills and that will not be affected by dry weather, hot winds, hail, or hog cholera. The cream check furnishes that ready cash and nearly every farmer has a few cows which can be milked.

Business men took up the idea and the Omaha Chamber of Commerce became interested. Largely through the efforts of Mr. Carl Gray of the Union Pacific, Mr. Walter Head at that time president of the American Bankers' Association, and Frank Farrington of the John Deere Company, a state wide organization, called the Nebraska Dairy Development Society, was formed. Unlike many such plans, it was started with a five-year program and memberships of $10.00 per year were for the entire period. All kinds and conditions of people joined in this movement to build a better agriculture. The board of directors is truly a cosmopolitan group. There sit, side by side, the railroad president, the banker, the manufacturer, and the farmer all thinking for the best for agriculture.

Shortly the society started functioning with a well known and capable dairyman as manager. Its program was not extravagant. It proposed to encourage the keeping of a few good cows on Nebraska farms, to eliminate the unprofitable cows, and provide for breeding better ones. This last was vitally important since the average dairy cow in the state only produced about 100 lbs. of butterfat or but little more than enough to pay for her feed. Labor, housing, and all incidental expenses can not be charged to the average cow or she shows red figures on the ledger. The remedy might have been to buy better cows, but buying good dairy cows from Wisconsin farmers is costly. Buying means shipping, credit from the bank, etc. Breeding better cows at home by using good sires is more logical, more practical, and less expensive.

The idea was good, but to sell it to the 100,000 farmers of the state was much harder. Here the agricultural officials of the Chicago, Burlington, & Quincy Railroad offered their services and those of their railroad in demonstrating the idea to the state. The replacement of the scrub sire was the real purpose. Through the cooperation of the College of Agriculture, the Nebraska Dairy Development Society, the State Dairymen's Association, the state dairy breed associations, various public spirited companies, and breeders of 31 pure-bred dairy bulls, the plan became a reality. The C. B. & Q. Railroad offered the train fully equipped. Everything was donated. The breeders, public spiritedly presented the young pure-bred sires which conservatively are valued at $5,000.00. This was done in some instances at considerable sacrifice on the part of the young breeder whose income was none too large.

After the bulls were assured the next thing was to survey the state to select 31 stopping places. Perhaps forty towns were visited and conferences held with the local committees before the selections were made. Each town agreed to provide a certain amount of advertising of the event and to have no conflicting attraction. After the towns were chosen, then a careful survey in each community was made to determine who was to make the exchange of a scrub sire for a pure-bred one. The bringing of a good pure-bred sire into the different communities in exchange for scrubs which were to be sold to the packing houses would furnish a striking object lesson of the differences between good and poor stock. The recipient must agree to take proper care of the bull received and with the eyes of the community upon him he will hardly fail to keep his promise. In some cases, the boys' and girls' dairy calf club will receive the sire and in one county a blind man is to have the bull.

The train that carries these bulls is to run as a special for the three weeks of the trip, making two stops a day in most cases. A stock car for unruly scrubs, a feed car, two baggage cars fitted with compartments for the young sires, a good representative cow of the Ayrshire, Guernsey, Holstein, and Jersey breeds and "Miss Mystery" about whom little can be learned. Next in line will be two passenger coaches fitted up with exhibits and a radio broadcasting and receiving station, then a sleeping car, and a business car. Such is the make-up of the "Pure Bred Sire Special" that bids fair to make agricultural history in Nebraska.

Nebraska. H. P. DAVIS.

ABBEKERK ADIRONDAC DAIRY MAID

California's new champion Holstein cow for ten months' production as a senior three-year-old is Abbekerk Adirondac Dairy Maid, owned by the Bridgford Holstein Company. In 305 consecutive days she produced 22,389 pounds milk containing 743.71 pounds butterfat, equivalent to 929.6 pounds butter, according to the Advanced Registry Department of The Holstein-Friesian Association of America. In addition to her state honors this cow is also the second highest milk producer in the United States for her class, as well as the third highest in America for butterfat production. She is the daughter of Adirondac Wietske Dairy Maid, the only cow in the world to produce 1,000 pounds butterfat in three different yearly test periods.—Extension Service, Holstein-Friesian Association of America.

U. S. Movie Truck Wins Support for Tick Eradication

HOARD'S DAIRYMAN:—A better public understanding of tick eradication and the many benefits which will result from the more economical production and wider use of milk, are the "gospel" which a one-ton truck carrying a complete movie outfit is spreading through Florida. This outfit, which is operated by a representative of the Bureau of Animal Industry, United States Department of Agriculture, has presented 80 showings in schoolhouses, churches, and four out of-door audiences since January 1. The pictures used are all educational films produced by the Department and they are shown before audiences in the more outlying rural localities. Many attending the meetings had not previously seen motion pictures.

A unique situation regarding this method of preliminary tick-eradication work, according to John F. Fahey, who has charge of the outfit, is the enthusiasm of the audiences. Even those who appeared at first indifferent to the advantage of better live stock and dairying, have become greatly interested after seeing the pictures. A short talk is a supplementary feature.

Mr. Fahey has made a careful study of the tick and dairy situation in Florida, and estimates that the state is losing each year more than $5,000,000 worth of milk in feeding cattle ticks. This estimate is based on a 42 per cent reduction of milk flow due to the tick, and a short lactation period of only 200 milking days in the year. The estimated loss per cow is $60 annually, or more than $5,000,000 for the 97,000 dairy cows in the state. The meetings are held without charge nor are collections permitted. The audiences are made up in part by women and children who show particular interest in the food value of milk, which is one of the important reasons for eradicating cattle ticks. "Too many of us," Dr. Fahey states in his lectures, "think of bone and teeth as permanent structures, whereas they change in character from day to day and from year to year as do other sets of cells in the body. In addition to other constituents of milk the mineral salts contained are indispensable to sound teeth, which are in turn indispensable to good health, energy, and endurance.

The truck has toured Madison, Gadsden, Leon, and Jackson Counties, Florida, and early in May was working in Holmes County. The next counties to be visited are Washington, Bay, and Calhoun.

The principal motion picture used in connection with the outfit is "Mollie of Pine Grove Vat", a three-reel production.

This picture tells in story form how the people of a community where cattle were infested with the blood-sucking cattle ticks, got rid of these pests largely through a local public sentiment and the heroism of a young woman. S. R. WINTERS.

The Dairy Cattle Congress

(Continued from page 365)

the one owned by Marlow that did not have the scale or capacity of either of the others.

The two-year-olds were a close class pretty well down the line and the judge took some time to get them placed, with May Pietertje Homestead Ormsby first and a good Carnation Stock Farm entry second.

The aged cow was a popular senior and grand champion with Mudcura Farms' junior yearling, junior champion.

In most of the senior bull classes, the tops were outstanding and only in the senior championship lineup was there much difference of opinion. Hoesley's aged bull, North Star Joe Homestead, is a mighty good type of Holstein, but he doesn't have the top nor quite the dairy quality of Johanna Rag Apple Pabst, owned by J. E. Piek, and the latter went up as he has at several earlier fairs. He was also grand champion.

Among the juniors, the Minnesota Holstein Co. showed a very flashy junior yearling that most of the ringside favored, but the judge selected a calf from the Jefferson County herd because of a better head and neck and somewhat better stretch.

The awards follow:

Bull 4 yrs. or over—1, Baaltz Hoesley on North Star Joe Homestead; 2, So. Dak. State College on Sir Aaggie Colantha Korndyke; 3, Jefferson County Asylum on Maple Row Sarcastic Lad; 4, J. E. Mack on King Canary Oak De Kol Fobes. Bull 3 yrs. and under 4—1, J. E. Piek on Johanna Rag Apple Pabst; 2, Modern W. O. A. San. on Corwin Wimple D. K. Ormsby; 3, Mudcura Farm on Duke Pietertje Korndyke Ormsby 31st; 4, Brace & Sons on Dodge County Homestead Boy. Bull 2 yrs. and under 3—1, Hanson, Gilley, Knief on Forum Ormsby Perfection; 2, Iowana Farms on Tritomia Pietertje Ormsby Lad; 3, Taylor & Christgau on Duke Ormsby Piebe De Kol; 4, Carnation on Sandy Segis Walker Mat. Bull 18 mos., under 2 yrs.—1, Carnation on Harvest Jewel Matador; 2, Modern W. O. A. San. on Woodcraft Pontiac Champion Star, 3, H. Umlandt on Ormsby Mechthilde Lad; 4, Hanson, Sauerbry, McLawry on Tritomia Pietertje Ormsby Buckeye. Bull 1 yr., under 18 mos.—1, Minnesota Holstein Co. on Sir Inka May; 2, Jefferson Co. Asylum on King Mutual Fan; 3, Webster County Calf Club on Tritomia Veeman Ormsby; 4, Emil Funk on King Homestead Fobes Gewina. Bull calf under 1 yr., bred by exhibitor—1, Christ & Hackbarth on King Richmond Pontiac; 2, Brace & Sons on General Homestead Mercedes; 3, Modern W. O. A. San. on Woodcraft Segis De Kol Champion; 4, Carnation on Alfred George Matador.

Cow 5 yrs. or over—1, Modern W. O. A. San. on Zwingara Segis Clothilde; 2, Carnation on Hazelwood Heilo Ormsby Mercedes; 3, Mudcura on Aaggie Mechthilde Mudcura Girl; 4, Uni. Nebr. on Clothilde Topsy King. Cow 4 yrs., under 5—1, Marlow & Randall on Mankato Segis Ormsby Bess; 2, Fred Waldman on Dolly De Kol Tirania Fayne; 3, Carnation on Carnation Matador Addie Segis; 4, Fred Gurr on Blue Eye Lady Johanna. Cow 3 yrs., under 4—1, Jefferson Co. Asylum on Madam Artis Wayne Denver; 2, Minn. Holstein Co. on Maudline Ollie Homestead; 3, Marlow & Randall on Mankato O. K. L. Blanche; 4, Carnation on Lady Bracelet Matador. Heifer 2 yrs., under 3—1, 3 and 4, Minn. Holstein Co. on May Pietertje Homestead Ormsby, Star Segis Homestead and Miss Inka Segis; 2, Carnation on Carnation Matador Mercedes Selah. Heifer 18 mos., under 2 yrs.—1, Jefferson Co. Asylum on Johanna Wayne Rue 3d; 2 and 3, Carnation on Carnation Pauline Matador and Carnation Matador Adelina Segis; 4, Dorothy Hanson on Fannie Macduff Janzen. Heifer not in milk, 1 yr., under 18 mos.—1, Mudcura Farm on Oakwood Piebe Allie; 2, Carnation on Carnation Matador Aaggie Col.; 3, Bryant & Thompson on Jessie Pet Pontiac Homestead; 4, Iowana Farms on Iowana Homestead Segis. Heifer under 1 yr., bred by exhibitor—1, Jefferson Co. Asylum on Clothilde Marguerite Albina; 2, University of Nebraska on Ormsby La Vie of U. of Nebr.; 3, Marlow & Randall on Mankato Lassie Ormsby 2d; 4, Carnation Milk Farms on Carnation Matador Lulu Walker. Cow having official yearly record begun at 5 yrs. or over—1, University of Nebr. on Clothilde Topsy King; 2, Iowana Farms on Lady Johanna Aaggie Fayne; 3, Minnesota Holstein Co. on King Korndyke Pontiac Lass Arlene; 4, Marlow & Randall on Dakota Dutchland Alice Brookings 2d. Cow having official yearly record begun under the age of 5 yrs.—1, Mudcura Farm on Aaggie Mechthilde Mudcura Girl; 2, Marlow & Randall on Mankato Segis Ormsby Bess; 3, Union College; 4, Iowana Farms on Iowana Ona Homestead De Cola.

Exhibitor's herd—1, Jefferson Co. Asylum; 2, Carnation Milk Farms; 3, Mudcura Farm; 4, Minnesota Holstein Co. Breeder's young herd—1, Carnation Milk Farms; 2, Modern W. O. A. San.; 3, Minn. Holstein Co.; 4, Marlow & Randall. Breeder's calf herd—1, Marlow & Randall; 2, Carnation Milk Farms; 3, Brace & Sons; 4, Jefferson Co. Asylum. Get of sire—1 and 2, Minn. Holstein Co. on get of Piebe Laura Ollie Homestead King and Sir Inka Superior Segis; 3, Jefferson Co. Asylum on get of Dutchland Creamelle Denver Prince; 4, Carnation on get of Matador Segis Walker. Produce of cow—1, Minn. Holstein Co. on produce of May Walker Ollie Homestead; 2, Carnation on produce of Hazelwood Bracelet Mercedes; 3, Univ. of Nebr. on produce of Varsity Derby La Vinnie; 4, Marlow & Randall on produce of Mankato Lassie Ormsby. A. R. cow—1, Minn. Holstein Co. on May Walker Ollie Homestead; 2, Carnation on Tillamook Lola May De Kol; 3, Iowana Farms on Iowana De Cola Ollie. Dairy herd—1, Carnation; 2 and 3, Minn. Holstein Co.; 4, Mudcura Farms.

Senior and grand champion bull—Johanna Rag Apple Pabst. Junior champion bull—King Richmond Pontiac.

Senior and grand champion cow—Zwingara Segis Clothilde. Junior champion heifer—Oakwood Piebe Allie.

Jerseys

Judge: F. W. Barber, Tennessee.

Exhibitors: The Oaklands, Michigan; Pebble Hill Plantation, Georgia; Sam F. Crabbe, North Dakota; South Dakota State College; S. S. Carroll, Meredith Jersey Farm, Hallie Fletcher, Dwight Harvey, Merle Stroud, Donald Hansaker, Mary Way, Ethyl Fletcher, Harry Crouch, Duane Bingamon, Josephine Crouch, Dorothy Stroud, Havard Hedrick, Waterloo Jersey Farm, Gletty & Noltensmeier, Harry S. Stein, Campbell Jersey Farm, W. F. Parrott, Iowa.

There were only 125 Jerseys on the grounds this year and 15 of these were entrants at the calf club show, but if the number shown was less than 1923, the quality was not. The entries were very good and the tops in almost every class were exceptionally desirable.

When the aged bull class started the ball rolling in the morning it was necessary to call in L. V. Wilson of Minnesota to place E. T. Meredith's Fashionable Fern's Lad that was at one time owned by Longview Farms when Mr. Barber had charge of the Jerseys there. Mr. Wilson put him up and below him was the ten-year-old Financial Beauty's King, showing as good now as he did a half dozen years ago, a remarkably good bull in many ways.

The three-year-old bulls brought out another very good top in Adelina's Sultan, owned by the Pebble Hill Plantation of Georgia. As it turned out, the close contest for senior championship was between this one and the Meredith aged entry with no odds either way. The two bulls had met three times previously this season and twice the older bull won, going down for the first time at Springfield a week earlier. This time it was two all, and the Georgia bull took both senior and grand championships. Wilson placed him up on his stretch, length of rump, and smoothness at the tail head. The outstanding junior bull, an easy junior champion, was Noble's Financial Modeller owned by Sam F. Crabbe of North Dakota.

You seldom, if ever, see a poor ring of Jersey cows at a show like Waterloo. Even those pretty well down the line are usually close to the desired type. This year there were thirteen aged cows to make up one of the good rings of the entire show, and as they lined up, two from the Pebble Hill herd were outstanding. Fern's Oxford Anemone caught everyone's eye and when she stood ahead before the milk-out it seemed as though she was a good winner. She had the lines, the spring of rib, the depth, and an exceptionally well shaped udder with good teat placement. Next to her was Financial Simple Interest, longer but not so deep nor so well fitted, and with not quite so well balanced an udder.

After the milk-out, however, the first cow showed an udder as large and almost as heavy as before, due partly perhaps to her recent freshening, while the Financial cow's udder was quite the opposite and because of that Mr. Barber switched the two for his final placing. Brampton Morna Primrose, owned by The Oaklands, Michigan, a winner at several fairs this fall, was a good third.

Tops among the four-year-olds and three-year-olds placed easier with Imp. Indispensable's Juanita and Gilberta's Victoria, both stablemates of the aged winner, taking their respective blues.

The Pebble Hill winning streak was broken when it came to two-year-olds and Xenia's Bowlina from The Oaklands, Michigan, went up and a Meredith entry, Successful Golden Cowslip, was so close a second that many of the ringside were doubtful which way they would place.

The aged cow was senior and grand champion. Financial Super Marjorie, owned by the Waterloo Jersey Farm, a senior yearling showing in milk, was junior champion.

The awards follow:

Bull 4 yrs. or over—1 and 2, Meredith Jersey Farm on Fashionable Fern Lad and Financial Beauty King; 3, Waterloo Jersey Farm on Financial Superior. Bull 3 yrs., and under 4—1, Pebble Hill Plantation on Adelina's Sultan; 2, Waterloo Jersey Farm on Financial Master; 3, Meredith Jersey Farm on Financial Successful King; 4, Campbell Jersey Farm on You'll Do's Eminent Laddie. Bull 2 yrs. and under 3—1, The Oaklands on Blond's Xenia Sultan; 2, Meredith Jersey Farm on Successful Laddie; 3, H. S. Stein on Iowa's Jolly Prince; 4, Waterloo Jersey Farm on Financial King the Great. Bull 18 mos., under 2 yrs.—1, Waterloo Jersey Farm on Financial Beauty King Mark; 2, Sam F. Crabbe on Super Noble Jolly; 3, Harry S. Stein on Iowa's Jolly Lois; 4, Gletty & Noltensmeier on Morn King of J. C. F. Bull 1 yr., under 18 mos.—1, W. S. Dixon on Jap's Giltedge Chief; 2, Pebble Hill on Bright Volunteer; 3, S. S. Carroll on Financial Duke of J. C. F.; 4, Crabbe on Models Financial Fern. Bull calf under 1 yr., bred by exhibitor—1, Crabbe on Noble's Financial Modeller; 2, Meredith Jersey Farm on Successful Cowslip King; 3 and 4, Waterloo Jersey Farm on Financial May's Master and Financial Super Raleigh.

Cow 5 yrs. or over—1 and 2, Pebble Hill on Financial Simple Interest and Fern's Oxford Anemone; 3 and 4, The Oaklands on Brampton Morna Primrose and Sleeper's Maid. Cow 4 yrs., under 5—1, Pebble Hill on Imp. Indispensable's Juanita; 2, The Oaklands on Armine's Sultana; 3, Crabbe on Financial Fontaine Pansy; 4, Waterloo Jersey Farm on Financial Lalla Rookh. Cow 3 yrs., under 4—1, Pebble Hill on Gilberta's Victoria; 2, The Oaklands on Buttercup's Lily Sultana; 3, So. Dak. State College on Gipsy's Golden Fairy;

Lead goes out in every rainstorm

EVERY time you put on a rubber raincoat and overshoes you don some lead. When rain beats upon your shoulders and puddles of water lie in wait for your feet, lead helps to keep you dry.

More than 10,000,000 pairs of rubber boots, 68,000,000 pairs of rubber shoes and overshoes, and more than 20,000,000 pairs of canvas shoes with rubber soles are made annually.

In making your rubber footwear and clothing, the manufacturer uses from 5% to 15% of lead in some form.

Litharge, basic lead sulphate, and white-lead, all obtained from the metal, lead, are used in rubber to obtain a uniform cure and great toughness. Today more than 19,000,000 pounds of lead are used annually by the rubber industry in rubber goods such as rubber bath mats, rubber aprons, rubber jar rings, hot water bottles,

This man is giving the farm house white-lead protection against the attacks of the weather.

hard and soft rubber electric insulation, hard rubber combs and pipe stems.

Lead's most general use

No matter to what extent lead is used in the rubber industry, its most nearly universal use is as paint. On every hand you see houses covered with white-lead to protect them from rot and deterioration and eventual destruction. Nearly 350,000,000 pounds of white-lead are used in this country on wooden and non-metallic surfaces annually.

Whenever you see a house, barn or silo scarred and weather-beaten or actually crumbling away, you can assume that the owner has neglected to give his property adequate paint protection. Such property first loses its freshness and attractiveness. Then it decays. In both cases, its value in the real-estate market drops.

Save the surface with white-lead

Wise farmers are today cutting down property repair costs and protecting their investments by more careful adherence to the watchword, "Save the surface and you save all." They have learned from experience that it is more economical to save the surface with white-lead paint than to repair or rebuild property that has rotted beyond repair. White-lead paint is cheaper than wood.

What the painter prescribes

Ask the professional painter what gives the greatest protection to surfaces such as wood. He will tell you pure white-lead mixed with pure linseed oil for exterior painting and white-lead and flatting oil to give a beautiful finish to interior jobs.

Painting facts by the score

How to save the surface of wood, masonry or metal on your farm with paint—that's what our "*Handy Book on Painting*" tells you. In this book are over a hundred pages filled to the limit with essential paint facts and formulas. We will gladly send this book free at your request.

Producers of lead products

Dutch Boy white-lead is the name of the pure white-lead made and sold by National Lead Company. On every keg of Dutch Boy white-lead is reproduced the picture of the Dutch Boy Painter shown below. This trade-mark guarantees a product of the highest quality.

Dutch Boy products also include red-lead, linseed oil, flatting oil, babbitt metals, and solder.

National Lead Company also makes lead products for practically every purpose to which lead can be put in art, industry and daily life. If you want information regarding any particular use of lead, write to us.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Peterson Vs. McKnight

HOARD'S DAIRYMAN:—It was with no little pleasure that I read in your August 29 issue the able article from the trenchant pen of our friend, Mr. McKnight. He complained recently of not being a rhetorician, and look ye now how he lays about him! This is as it should be; when the steel rings true we admire the skillful thrust no less than the adroit parry. It is only unfortunate that Mr. McKnight and the writer could not have met long ago. What unalloyed pleasure might have been theirs, could they have carried on this discussion uninterruptedly for the past 30 years!

Mr. McKnight has a perfect right to think that "economic demand" is the demand made by humans on the raw materials of nature, although it might be furtively interjected that most writers on economics take the view that it is the commercial demand for things ready to use. The distinction is important. Demand is certainly greatly stimulated, if not in many cases almost wholly created by the display of goods. Thus the automobile industry which, next to bootlegging, is the greatest industry of our country, was not created by a universal demand for automobiles before these contraptions were invented; but when Henry Ford made his first gasoline driven buggy, after the first terror incident to its appearance had subsided, an increasing desire to get the "kick" out of a like adventure created the demand. Manufacturers have tried their best to do the rest.

No, Mr. McKnight's castle in Spain (or on the highlands of Centerville) would have no economic value, except as it made him a better producer by reason of his having a good home. Neither would it gain such value, no matter how many of his fellow citizens sought to flatter him by living in close proximity to him, unless it were put upon the market. (You do not speak of the rental value of Buckingham palace or of our own White House).

For the sake of charity of thought and lucidity of expression, it might be well to observe the ethics of debate and not try to make an opponent say something which he did not say, nor base an argument on a plain misinterpretation of what he did say. It will be noted, then, that I have not at any time said that there was not an increase in real estate values incident to a conflux of population. It is the unearned quality of the increase which I have denied and sought to disprove. As has been pointed out, capital must earn something or there would be no capital. If it is conceded that the seemingly phenomenal increase in value of building lots in Manhattan is in reality no greater than the amount at bank interest of the original investment, that surely does away with the whole unearned increment theory. We stress the untenableness of this premise of the single taxes because the premise is the basis of their whole philosophy. In storming the stronghold of an enemy it is but natural strategy to dynamite the foundation of his citadel.

Mr. McKnight says that the chain-stores base their offers of rent on the number of people, by actual count, who pass a given point within a given length of time. Very well; we will station the rent evaluator of the Great A. and Q. Coffee Grinders, Inc., on Market St., Philadelphia,—say at the point when the subway train comes out of the ground (like a woodchuck pops out of his hole to ascertain whether the danger from which he had fled was real or imaginery) and mounting skyward, becomes in turn an elevated train. The date is October 13. The Knights of Columbus have staged a parade, 20,000 strong, in honor of their patron saint and intrepid explorer's discovery of the Bahamas, 432 years ago. The parade passes our observation post with banners flying (like the regal Maize unfurls his luxuriant banner here at Maplewold). On the same day the Ku Klux Klan, whose white garb may not be wholly emblematic of that white robed multitude which St. John saw in the Apocalypse, parades down Market Street 30,000 strong. These march and countermarch until the green blends with the white and all make common cause against our common enemy, the lawless liquor traffic. In the afternoon of the same day the Epworth League, 3,000,000 strong, who also love their own church but love liberty of conscience even better and hate the tyranny of ecclesiastical rule, sends a delegation of 15,000 to march down Market Street. These are all there is to "mere presence" but if the rent-evaluator of the A. & Q. counts them all as potential patrons, I fear he will greatly miss the mark.

There is no such thing as permanence of residence. "We have here no continuing city." In the vernacular of the street, "We are here today and gone tomorrow." That is doubtless why landlords require advance payment of rent.

The soil of discussion has thus far been only summer fallowed. After proper tillage there will follow seed time and harvest.

New York A. N. PETERSON.

An Interested Reader

HOARD'S DAIRYMAN:—This is no attempt on my part to enter the "lists" or to side with any of the word bandiers of these columns. It is just a word in edgewise to let Timothy Viers, the New York Teat Puller, the semi-preaching Missourian, and the rest of the restless family know that they have a ready audience in one interested reader at least. Were we all to make known our convictions, there would be an appreciable jumble but as the inclination seems only to occur to a representative few, we other readers may well enjoy the amusing, though sometimes enlightening, verbal tilts.

Wisconsin. K. F. WHITSON.

Sheriff Kept Away by Black and Whites

HOARD'S DAIRYMAN:—It was strange how I first got to reading your dairy gospel and I am not much on writing long stories but if it is worth it to you, I could tell a very interesting short story about your good paper. This makes seven new members to the Hoard's family that I have sent in and I offered one man his money back if he wasn't satisfied in six months with the paper.

I have seventeen head of black and white cattle that I am as proud of as a little boy is of a new wagon.

We tried grain farming for over twenty years and I can say that the black and white cow is the thing that kept the sheriff from telling us when to move.

Nebraska. W. E. MARTIN.

Judging by Type and Production

HOARD'S DAIRYMAN:—The present system of judging dairy cattle is far from satisfactory. Beef cattle, horses, and hogs can be very accurately judged by comparison and nearness to the ideal type that every judge has in mind in placing a class of live stock. With dairy cattle it is a different proposition. Dairy cattle are bred for the milk and butterfat they produce, and this cannot be accurately determined by judging the conformation of a cow. The system of records of production of dairy cows, as now used in cow testing associations and in Advanced Registry work, is the only accurate method of judging the production value of a dairy animal. However, our whole show system is built upon type and it would be folly to disregard type altogether.

It would seem that a system of judging where both type and production were taken into consideration would be the logical method of judging dairy cattle. Outside of the Advanced Registry class at the National Dairy Show there has been little attention paid in the United States to judging both type and production as revealed in records. Denmark has for some time made allowance for production as well as type at her fairs.

A Type and Production Class for dairy cows was established for the first time in Minnesota, at the Freeborn County Fair at Albert Lea, Minn. A class was made for Jerseys, Guernseys, Holsteins, and grade Guernseys, and all ages competed. The difference in age of the cows was equalized by making an allowance for cows under five years according to age at which record was made. The following table was used which is the difference allowed by the different breed associations in computing the requirements for entry in the Advanced Registry:

Age	Guernsey	Holstein	Jersey	Milking Shorthorn
	%	%	%	%
2 yrs.	70	60	65	62
3 yrs.	80	75	75	76
4 yrs.	90	86	87	88
5 yrs.	100	100	100	100

In calculating the score on production, 1,000 lbs. of butterfat were used as 100 per cent. The score on type was placed by the judges in the usual manner, and the final score is the average of the type and production scores.

It is interesting to note that the Holstein cow, De Kol, received a score of 90 on type which placed her first in type score, while her production score of 59.8 brought her down to 6th place. In the open class this cow received first place. In the pure-bred Guernsey class the highest scoring cows on type were second and third while the cow winning in this class did so on her superior production.

The prizes for the Type and Production Class were $15, $12, and $8.

It is a little unfair to have cows that are milked four times a day, as is done in making Advanced Registry records, compete with cows that are milked but twice a day in cow testing associations. The difference in these two kinds of records is also in the conditions under which they are produced. It is impossible to get the cows exactly on an equal basis. If the two-time milking records were calculated as 60 per cent of the four-time milking records, it would place the cows on more nearly an equal basis according to their opportunity and ability of making records.

Axel Hanson judged the Holsteins; L. V. Wilson, the Guernseys; and Roy Cook, the Milking Shorthorns.

Re-roof for the last time

right over the old roof

Save money the Johns-Manville way

YOUR new roof—it must be permanent, fire-safe and economical always.

Naturally you want to get this kind of roof at the lowest cost possible.

We have yet to discover any method of re-roofing that can equal the Johns-Manville method in these respects. Simply lay Johns-Manville Asbestos Shingles right over the old roof of any building on your farm.

You save time and labor in application. You save the inconvenience as well as the cost of ripping off the old roof.

The job is quickly finished and you have a fire-safe, permanent shelter and one of the best looking roofs you will find anywhere.

Johns-Manville Asbestos Shingles are fire-safe, and so approved by Underwriters' Laboratories, Inc.

They cannot rot or disintegrate. They will never wear out. They do not require any maintenance expense.

When you re-roof the Johns-Manville way you save money from the start—by laying an economical roof by the most economical method. Most important of all you have re-roofed for the last time. Send coupon for details.

Asbestos and its allied products: INSULATION, BRAKE LININGS, ROOFINGS, PACKINGS, CEMENTS, FIRE PREVENTION PRODUCTS

JOHNS-MANVILLE Asbestos Shingles

Canadian Cream and Milk

More than double the quantity of fresh milk and cream was exported from Canada to the United States in the twelve months ending June 30, 1924, than for the same period last year. In the past twelve months 2,396,725 gallons of milk, valued at $472,930, were exported, compared with 1,140,073 gallons last year, valued at $244,715 according to the Canadian News Letter of August 8, 1924. There were 2,965,044 gallons of cream shipped to the United States for the twelve-month period ending June 30, 1924, valued at $4,873,226, as against 1,894,894 gallons, valued at $3,212,420 last year.

A very creditable record was made by Sayda's Violet Meridale when she produced 616.10 lbs. fat and 10,234 pounds milk in 305 days at six years of age. Milk averaged 6.04 per cent fat for the test. This very creditable performance wins for this Jersey a gold medal.

Mrs. Dora Moeller, Indiana, is the owner of Sayda's Violet Meridale.—The American Jersey Cattle Club.

BOWSHER'S HEAVY-DUTY GRINDERS

FOREMOST AMONG BETTER GRINDERS
Crush and grind all the grains that grow; **fine** for hogs or coarser for cattle feeding, **Corn** in husk, **Head Kafirs**, and all **small grains**.
Strength, Durability and **Service** radiate from every line of these Masterful Grinders. Simple, yet effective in adjustment. Last a lifetime.
LIGHT RUNNING — LONG LIFE — EXTRA CAPACITY
CONE-SHAPED BURRS
10 sizes—2 to 25 H. P. or more. Also Sweep Mills. It pays well to investigate. Catalog FREE.
The N. P. D. Bowsher Co., South Bend, Ind.

Do Your Own Shredding

with a **ROSENTHAL Corn Husker and Shredder**

Most economical and satisfactory way of handling your corn crop. No delay, no extra help. Do it in your own spare time. Two sizes for individual use, 6 to 15 h. p. Also make two larger sizes for custom work. Over 25 years in the field. Write for catalog and prices, also useful Souvenir **FREE.** State H. P. of your engine.

Sold on trial. You take no risk.

Senior and grand champion bull—Adelina's Sultan. Junior champion bull—Noble's Financial Modeller.

Senior and grand champion cow—Financial Simple Interest. Junior champion cow—Financial Super Marjorie.

Brown Swiss

Judge: J. B. Fitch, Kansas.

Exhibitors:—N. C. Schmid, Lila Schmid, Fred Reuter, Wisconsin; L. S. Marshall & Son, Michigan; E. J. Hieser, Howard Davis, A. E. Bower & Son, Illinois; F. P. Minette & Son, Joseph B. Segner, Geo. E. Segner, Minnesota; J. W. Hess, Indiana; The Hull Bros. Co., Ohio; Mooney & Larrabee, Albert Heskje, Alfred Alpers, Ivan Thelander, Leonard Thelander, Kenneth Thelander, Thelman Heskje, Earnest Alpers, Iowa.

Brown Swiss representation at the larger shows has increased remarkably during the past few years and nowhere have we seen a better show of the breed than at Waterloo this year. There were 125 entries representing herds from seven states and while they stood third in point of numbers among the breeds, it was interesting to note the number of men interested in other breeds who watched them judged and commented on their increasing midwest popularity.

Thirteen aged cows made a most interesting class and until the milk-out Judge Fitch hardly knew just where his top would be. He had Betty of Lake View first and Hull Bros.' Swiss Valley Girl 7th, second, but after they were milked, positions had to be reversed. Betty has better depth of body and perhaps a slight advantage in size and shape of udder, but she is not so well set at the pin bones and her udder does not possess the quality that is evident in that of the Hull entry.

Swiss Valley Girl 7th was later made senior and grand champion, her nearest senior rival being Minette's winning two-year-old, Believe's Darling of Far View. This winning by the Hull entry is remarkable because the cow is 15 years old and with the exception of two seasons she has been a consistent winner since she was a yearling. She has been grand champion at three National Dairy Shows and held similar placings at the state fairs very many times.

Junior championship went to a good senior yearling heifer, Tremont Neva K., owned by Howard Davis of Illinois.

The judge found his best senior bull in the three-year-old class which included three entries and which incidentally seemed to the ringside experts (?) to give him the most trouble. There was Prince of Meadow Green owned by Marshall & Son, Blackstone from the herd of Fred Reuter, and Edgard C. owned by A. E. Bower & Son. The first and last seemed much of the same type and cleaner cut dairy bulls with the Marshall entry cleaner in the thighs and better at the pins while the Bower bull was better in front and perhaps a little better balanced. Ringside opinion was pretty well divided on these two for first with the Wisconsin bull, a little thicker fleshed kind, for third. They finally placed with Prince of Meadow Green first and the Illinois bull last with Blackstone between them.

Marshall's bull was senior champion but was beaten for final honors by the junior champion, Ursula's Stasis, an outstanding senior yearling from the same herd.

Four state herds of Brown Swiss were out, Wisconsin, Illinois, Iowa, and Minnesota. They placed in the order named.

Bull 4 years or over—1, Mooney & Larrabee on Carl The 6th; 2, Hull Bros. Co. on Carl the 13th; 3, F. P. Minette & Son on Emmett of Lake View; 4, J. W. Hess on Shillings Reuben. Bull 3 years, under 4—1, L. S. Marshall & Son on Prince of Meadow Green; 2, Fred Reuter on Blackstone; 3, A. E. Bower & Son on Edgard C. Bull 2 years, under 3—1, Fred Reuter on Happy Boy of Gladmont; 2, Hull Bros. on Dale of Lake View; 3, A. E. Bower & Son on Elsie Nick A; 4, L. S. Marshall & Son on Buster Brown of Osseo. Bull 18 months, under 2 years—1, L. S. Marshall & Son on Ursula's Stasis; 2, Hull Bros. Co. on Lottie's Prince of Lake View; 3, A. E. Bower & Son on Bonick of Bowerhome; 4, J. W. Hess on Pixey. Bull 1 year, under 18 months—1, N. C. Schmid on Maiden's Vronicka's College Boy; 2, Mooney & Larrabee on Marie Carl; 3, F. P. Minette & Son on Believe's Grandson 3rd of Farm View; 4, Hull Bros. Co. on Beaut of Lake View. Bull calf under one year bred by exhibitor—1, Hull Bros. Co. on Bob of Lake View; 2, L. S. Marshall & Son on Styx Stasis 3rd; 3, Mooney & Larrabee on Jan; 4, Lila Schmid on Maiden's Master.

Cow 5 years or over—1, 3 and 4, Hull Bros. Co. on Swiss Valley Girl 7th, Swiss Valley Girl 10th, and Swiss Valley Girl 8th; 2, A. E. Bower & Son on Betty of Lake View. Cow 4 years, under 5—1, N. C. Schmid on Molly's Nellie; 2, F. P. Minette & Son on Betty of Far View; 3, L. S. Marshall & Son on Fairview Valley M; 4, Fred Reuter on Susie's Mollie. Cow 3 years, under 4—1, L. S. Marshall & Son on Styx 2d Beauty; 2, Hull Bros. Co. on Nellie F. Beaut; 3, Fred Reuter on Carl the 14th's Butternut May; 4, A. E. Bower & Son on Nickduchess of Bower Farms. Heifer 2 years, under 3—1, F. P. Minette & Son on Believe's Darling of Far View; 2, Hull Bros. Co. on Margaret of Lake View 4th; 3, A. E. Bower & Son on September Morn of Bowerhome; 4, N. C. Schmid on Brown Ethel. Heifer 18 months, under 2 years—1, Howard Davis on Tremont Neva K; 2, Mooney & Larrabee on Carl Beauty; 3, Fred Reuter on Carl's Pride; 4, N. C. Schmid on Marvel M's 2d Hazel. Heifer not in milk, 1 year, under 18 months—1, N. C. Schmid on Mernervie of Meadow Green; 2 and 4—Hull Bros. Co. on Militor Emma of Lake View and Miss Edna of Lake View; 3, A. E. Bower & Son on Betty H of Bowerhome. Heifer under 1 year, bred by exhibitor—1, N. C. Schmid on Meadow Green Sadie; 2, Mooney & Larrabee on Schonnette; 3, Fred Reuter on Carl's Lassie; 4, Lila Schmid on Browney A's Last. Cow having official yearly record begun at 5 years or over—1, Hull Bros. Co. on Swiss Valley Girl 10th; 2, F. P. Minette & Son on Believe. Cow having official yearly record begun under the age of 5 years—1, A. E. Bower & Son on Betty of Lake View; 2, F. P. Minette & Son on Dorothy Believe of Far View.

Exhibitor's herd—1, Hull Bros. Co.; 2, L. S. Marshall & Son; 3, A. E. Bower & Son; 4, Fred Reuter. Breeder's Young Herd—1, N. C. Schmid; 2, Mooney & Larrabee; 3, The Hull Bros.; 4, Marshall & Son. Breeder's Calf Herd—1, N. C. Schmid; 2, Mooney & Larrabee; 3, Marshall & Son; 4, Hull Bros. Co. Get of sire—1, Hull Bros. Co. on get of one Sire Reuben; 2, Marshall & Son on get of Stasis Boy of Sedgley; 3, Mooney & Larrabee; 4, N. C. Schmid. Produce of cow—1, Hull Bros. Co. on produce of Swiss Valley Girl; 2, F. P. Minette & Son on produce of Calhoun Maiden; 3, J. W. Hess on produce of Valley Girl 2d; 4, Marshall & Son on produce of Styx. A. R. cow—1, F. P. Minette on Believe; 2 and 4, N. C. Schmid on Cinnamon's Maiden and Molly's Nellie; 3, Hull Bros. Co. on Nellie F. Beaut. Dairy herd—1, Hull Bros. Co.; 2, L. S. Marshall & Son; 3, A. E. Bower & Son; 4, N. C. Schmid.

Senior champion bull—Prince of Meadow Green. Junior and grand champion bull—Ursula's Stasis.

Senior and grand champion cow—Swiss Valley Girl 7th. Junior champion heifer—Tremont Neva K.

Ayrshires

Judge: Professor H. H. Kildee, Iowa.

Exhibitors: Ayrcroft Farms, Adam Seitz and Sons, Wisconsin; F. H. Baskins, J. J. Lynes and Sons, and Matt L. Frost and Son, Iowa.

The Ayrshire show this year was not as good as that of a year ago. The winners were well up to the Cattle Congress standard but there should have been a better representation there. As it was there were but 77 head from two states where a year ago there were 112 head from 4 states.

Seitz and Ayrcroft took all the blues, eighteen out of twenty-one going to the former as did all championships.

Cavalier's Ping Pong, showing in the best form we have ever seen him, was outstanding among the bulls and a very good grand champion. For a five-year-old bull he has a remarkable show record. Shown first as a junior calf he has been defeated but once in his class, has won 27 firsts and 31 championships, 15 of them grand championships. Further, the bull shows every indication of going on and should prove a serious contender at any show for some time.

S. F. Helen R., Seitz's aged cow, showed exceptionally good. She has the scale, length, depth, and udder to make her hard to beat at the National unless the competition is very unusual. She was of course senior and grand champion female.

The heifer calf, Cavalier's Lady Perfection, from the same herd, was junior champion with Simmons' Ayrcroft Show Lillie runner up.

The awards follow:

Bull 4 years or over—1, Adam Seitz & Sons on Cavalier's Ping Pong; 2, Ayrcroft Farm on Cavalier The Last; 3, F. H. Baskins on Netherhall Rising Star. Bull 3 years, under 4—1, Ayrcroft Farm on Ayrcroft Cavalier Goldfinder. Bull 2 years, under 3—1, Seitz & Sons on Cavalier Sherry Redman; 2, F. H. Baskins on Cavalier Freetrader. Bull 18 months, under 2 years—1, Seitz & Sons on Cavalier Lord Messalliance; 2, J. J. Lynes & Sons on Lynes' Choice of Penhurst; 3, F. H. Baskins on Cavalier Morning Star. Senior and grand champion cow—S. F. Helen R. Junior champion heifer—Cavalier Lady Perfection.

Guernseys

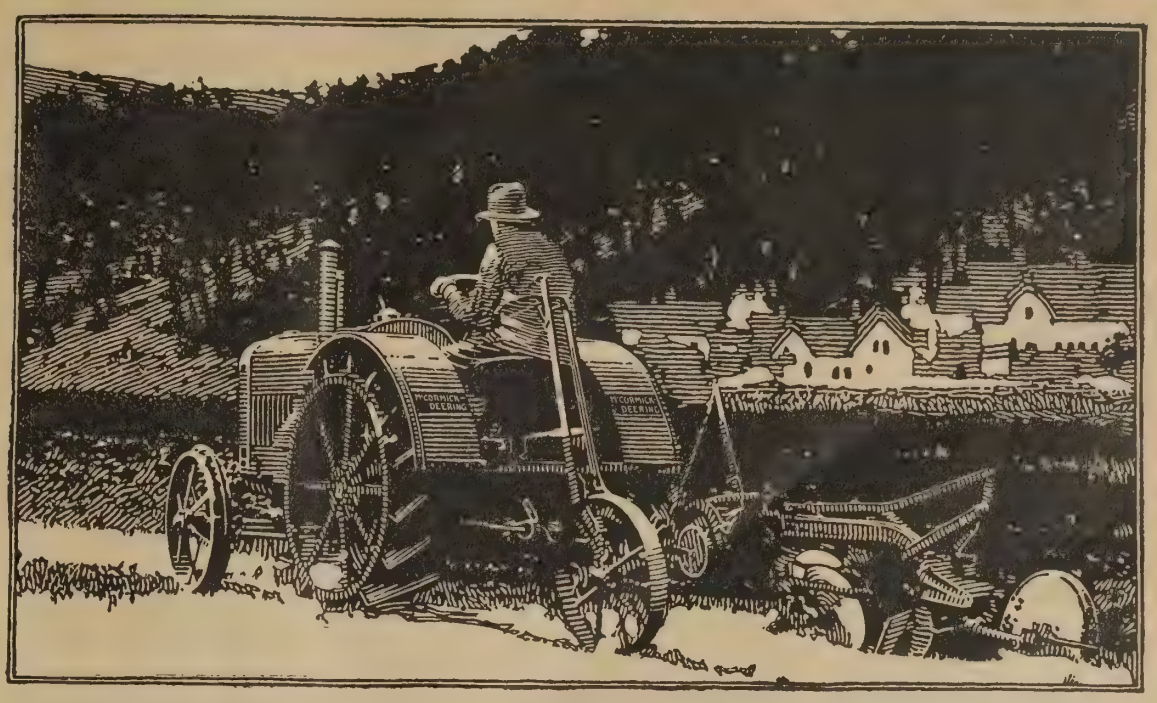
Judge: L. V. Wilson, Minnesota.

Exhibitors: L. P. Martiny, William Larsen Canning Co., Goodhand Kingston & Son, F. E. Fox, Ed. T. Williams, Geo. McKerrow & Sons Co., C. J. & W. A. Connell, J. M. Harvey, F. J. Reuping, Wisconsin; C. E. Swenson & Sons, Simon Kruse, Minnesota; Joseph Golinvaux, Mountain Bros., W. W. Marsh, Helen Lee, Robert Lee, Christian C. Hansen, Leona Hansen, Ottmar Weber, Justin R. Lund, Herbert Rowland, Elmer W. Stevenson, Marple Mountain, Iowa; E. S. Person, North Dakota.

Last year the Guernseys made the poorest show at Waterloo of any of the breeds; this year it was one of the best, with plenty of classes that were close. The bull classes were not so well filled as were those of females and in almost every one the top was outstanding. Corium Princess Carrie's Champion, F. J. Reuping's four-year-old, was easily the best of the senior bulls and a good grand champion, but when it came to the juniors it was not so easily placed. The judge put up Corium Cherub's Edgar, a junior yearling also owned by Reuping.

The 12 aged cows made a hard class to decide on. Honey Bloom of the Prairie, owned by Marsh, was a good and easy top but the next three places were close enough to permit of plenty of differences of opinion. They finally lined up with Marsh Marigold of the Prairie, a more refined but typy cow second, May Rose Clara of Minot, a heavier framed cow of a little different type and with not too good a rump, third, and Diamond of Maple Hill, second at the 1923 National, fourth. The latter has more length and is enough better behind so that many thought she might well have gone one or two places farther up.

Another hard one to decide was first and second places among the three-year-olds. Floridale Merry Maid and Peach Blossom of the Prairie, the first from Corium Farm and the second owned by Marsh, were outstanding, but it seemed to us that the latter with better depth, top, and an exceptionally well shaped udder could well go up. The judge, however, found them close enough so that better handling quality and a little better quality of udder decided him in favor of the Wisconsin entry.



Honey Bloom of the Prairie was senior and grand champion female and among the juniors, Danny's Maid of Fern Dell, a calf from the Larsen Canning Co. herd, undefeated in class this year, was the best.

The get of sire class was very interesting not only because the top get, four females in milk, was so good, but also because the top 5 places went to groups of "Cherub" breeding, representing four herds in Wisconsin and Iowa. The winners, which were Marsh entries, made as good a get of sire group as we have seen in a very long time.

Bull 4 years or over—1, C. E. Swenson & Sons on Floridale General Washington; 2, Joseph Golinvaux, on Memento of Highland Place; 3, E. S. Person on Queen's May Secret of Minot; Ed. T. Williams on Proud Prince of Edgemoor. Bull 3 years and under 4—1, F. J. Reuping on Corium Princess Carrie's Champion; 2, L. P. Martiny on Proud Prince of the Prairie; 3, Wm. Larsen Canning Co. on Golden Heir of Fern-Dell; 4, W. W. Marsh on Gold Star of the Prairie. Bull 2 years and under 3—1, Mountain Bros. on Kitchener's Cavalier of Iowanola; 2, Person on Imogene's Prince of Iowanola; 3, C. J. & W. A. Connel on Defender of Waddington; 4, Reuping on Corium Rose des Houards Superb. Bull 18 months, under 2 years—1, Wm. Larsen Canning Co. on Rose's Boy of Fern-Dell; 2, Mountain Bros. on Beey's Master of Iowanola; 3, Marsh on Cherub's Sunkist of the Prairie; 4, Person on Luetta's Emigrant of Minot. Bull 1 year, under 18 months—1, Reuping on Corium Cherub's Edgar; 2, Marsh on Cherub's Prospect Sunkist of the Prairie; 3, Mountain Bros. on Dorothy Marie's Challenger of Iowanola; 4, L. P. Martiny of Proud King of Chippewa. Bull calf under 1 year, bred by exhibitor—1, Marsh on Gay Lad Sunkist of the Prairie; 2, Reuping on Corium Ladock Prince's Forest; 3 and 4, Mountain Bros. on Lady Challenger of Iowanola and Challenger's Regent of Iowanola.

Cow 5 years or over—1, 2, and 4, Marsh on Honey Bloom of the Prairie, Marsh Marigold of the Prairie and Diamond of Maple Hill; 3, Person on May Rose Clara of Minot. Cow 4 years, under 5—1, Marsh on Honey Dew of the Prairie; 2, Person on May Rose Glory of Minot; 3, Reuping on Easter Lily of

This Outfit Is On Thousands of Fields

PUT IT ON YOURS—

Your fall work would be a lot easier and more profitable all around if you had a McCormick-Deering 2 or 3-plow tractor turning the soil and doing late summer and fall belt work.

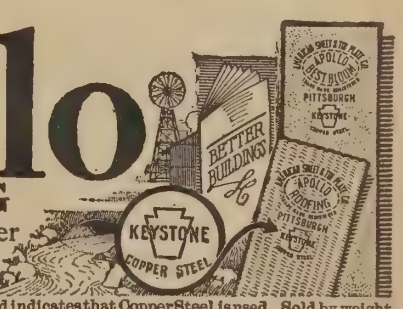
Now is as good a time as any in the year for a man to come into McCormick-Deering tractor ownership. Weeks of hard work and hot weather have been exhausting man and horse. Many weeks of trying work lie ahead. Labor is scarce and high-priced and every week's wages takes money out of pocket. Plowing, the slowest, most laborious, most expensive farm work stares every farmer in the face.

With the McCormick-Deering 15-30 tractor one man plows 12 acres a day; with a 3-horse team he averages only 3 acres. *With the tractor he does 4 days' work in 1 day.*

With the tractor he plows deeper and better, and at the right time; heat and hard ground don't stop him; he saves the moisture and gets ahead of weeds. Between-times his tractor tackles the corn harvest—runs the binder and picker, fills the silo, runs shredder or sheller—and then it finds all kinds of winter belt jobs ahead of next spring's work.

Farm product prices have taken the upgrade. Better times are on the way to the farm. Be in position to farm efficiently all the year, without yielding your profits to surplus labor costs. See the dealer about a McCormick-Deering Tractor—lasting, dependable, all-around farm power.

Some of the Good Things About
McCormick - Deering 10-20 & 15-30 Tractors



Triple Power Drawbar—Belt—Power Take-Off

Write for free "Better Buildings" booklet containing building plans and valuable information.

AMERICAN SHEET AND TIN PLATE COMPANY, General Offices: Frick Building, Pittsburgh, Pa.

LUCY THOMPSON

Your New Hat

A fine time to buy a hat is a month or so after all the rest of the women have bought theirs.

I may be mistaken but it seems to me that ten or fifteen years ago hats went out of style a lot faster than they do now and furthermore that we simply had to change hats when the season changed. We don't have to do this any more as felt hats—especially the plain sports type—are now worn the year around.

These hats began coming into the milliners' shops this year in May and especially in the lighter colors were worn through the hottest days of July, though goodness knows they are are not comfortable when the weather is warm. However, if we must be uncomfortable it is a great deal easier to be uncomfortable and in style than to be uncomfortable and out of style.

A friend of mine has a black taffeta hat—one of the small, close-fitting variety—that she has been wearing for a year and a half, both summer and winter and it always looks appropriate. She also has a straw hat for summer and a velvet for winter but this taffeta hat is a little dressier and fits in well and provides a pleasant change for her and her friends who always feel that she is well dressed because she doesn't have to wear the same hat all the time.

It doesn't cost a bit more to have two or three hats than to have one if you are foresighted about getting them and then take good care of them. Only the very well-to-do should buy hats that are extreme in shape, color, or size as these are the kind that we tire of soonest and most quickly want to replace.

Don't let a glib-tongue sales woman cajole you into buying a hat you don't want. We are all a little afraid of a smart, up-to-date looking clerk and lots of times we buy a thing because, having looked at several, we are ashamed to say that nothing suits.

I find it a good plan with a certain type of clerk to state what I want and what I can pay and I am training myself not to take a clerk's time unnecessarily but also not to buy unless I am suited. A poor purchase never brings any pleasure and is often sheer waste.

In the larger stores hats are always reduced as soon as the peak of the season is over. I was visiting in a large city once and on July 5 got a handsome sailor hat for four dollars and ninety-five cents that had been ten dollars on July 3. The clerk said that the Fourth always marked what they called the end of the season on sailors.

The hat, by the way, was white. I wore it that way for two summers, painted it green for one, and made it black for two summers more. I almost wept when the brim broke and I finally had to throw it away for with all the changes I put upon it, it always kept its shape and looked well.

This fall most of the newest hats have a high, flat-topped crown and narrow brim—sort of stove pipe effect. This comes nearest to being what is called "the style" of any one type, though plenty of others are shown so that you can get other kinds if this happens to look freakish on you. There is nothing smarter looking than this shape if it happens to be just your style but oh, woe, if it isn't!

Feather trimming is in good style though it is especially suitable to the older women. For the young nothing is better than the tailored, flat ribbon bows either plain or with a buckle in the middle.

You can easily make most of these trimmings and at a great saving. The only trouble is to know how. Just take a little time and courage when you are in town next time, examine something you admire, buy the materials and then go home and make it before the idea has time to get cold.

Some of the big pattern companies are helping us now by having hat patterns which are extremely practical. I would not advise your trying to make the frame, however. It sounds easy but I have found out that it is tricky business and anyway you can get them at the ten-cent store.

Can You Help?

I had a letter lately from one of our readers saying, "I wish I knew some way to make money. My children are growing up and there are so many things I want for them; things they really ought to have aside from just food and clothing.

"I think that one of my little girls has some musical ability but we have nothing for her to play on even if we had the money for lessons.

"Of course I am as busy as I can be all the time but I believe I could find a little extra time this winter if I only knew what to try that would make some money. Can you help me?"

If the truth were known, that letter might easily have come from any one of thousands of our readers. There are many things we all want and so few of us who have the money to get them. It is right for us to want things, too. I get mad every time I hear anyone saying, "Oh, she is always wanting something", as if it were a fault.

Whenever we women stop wanting things it is because our spirit is breaking down. Don't stop; keep on, being sure all the time that the thing you want is worth while. To be worth while it doesn't have to be fine-sounding. It is worth while to wish for nothing more than plenty of hair nets to keep your hair neater and prettier or for a yard or two of good lace to go in the neck of your dress.

An old lady said to me lately, "I guess I was just naturally born with a big wishbone. Seems as if I was always wanting something but we were always poor with our seven children and my husband no hand at making money. I heard that old saying once about some people being all wishbone and no backbone but I never was that way. I always did the best I could and kept on believing that things would come and now look at me what I've got.

"Couldn't anyone want more and besides I get a fine trip every year. Of course," she added with a twinkle, "I had to wait till I was 70 before it came but then some folks just let down and quit trying and wishing and then they never get anything, so I guess I'm pretty lucky."

Now this is what it's all about. If any of you have found ways of making money that are practicable and that the average farm woman can use, won't you write and tell me about them? I think we could have a great time swapping experiences and helping each other out. It takes time to write it down, but squeeze it in by hook or crook and maybe some day we can return the help.

Swiss Steak

One of the pleasantest memories I have of school days is the smell of something good cooking when I came home, raging hungry. Schools have started by this time and there is something almost impossible to satisfy about the late fall appetites. They are worse than those of winter, if possible.

One of the hearty meals that we like for this time of year is Swiss steak. It almost makes a meal in itself though some mashed potatoes go awfully well with it.

For this take two pounds, say, of round steak, lay it on the table after wiping it with a damp cloth and into it pound as much flour as you reasonably can. Some people use the edge of a plate for this pounding but I find the potato masher much more satisfactory. Have several spoonfuls of fat smoking hot in the frying pan and brown the meat on both sides.

From this point on you can use your own imagination and make all the changes you want to but what we like is to cover the top with a mixture of tomatoes, onions, green peppers, and seasoning. Then we pour on about a cupful of hot water and set it all to simmer either in the oven or on top of the stove. It takes about two hours for it to get well done and it must be closely covered in order to keep in the steam. Otherwise the water will evaporate and it will burn.

It is nicest to have the steak cut quite thick. You can use this method of cooking on other less expensive cuts just as satisfactorily. Flank steak is delicious if you give it enough time in the cooking.

Green Tomato Relish

Last fall we had an unexpected early freeze one night and next morning when I went to the garden I found my nice green tomatoes like balls of ice. We picked them then and there and I made them up into a pickle that, well, we liked it so well that it was gone before Thanksgiving in spite of the amount I made.

I just ground the tomatoes and an equal amount of onions through the food chopper; of course you could easily use fewer onions and have nearly the same flavor. Salt the mixture and let stand overnight. In the morning drain well and add vinegar with just enough sugar to take the sharp taste off. Heat this mixture for 15 minutes after it has come to

(Continued on page 379)

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Aunt Ada's Axioms: Life is a hard school; and hearts may be broken in old age if selfishness is not curbed in childhood.

Hanging up a broom prolongs its life but if you don't want to bother with a hook, stand it on its handle.

On the floor is shown Gold-Seal Congoleum Rug No. 516. The 6 x 9-foot size costs only $9.00.

Six new and beautiful Congoleum Rug designs—

Gold-Seal Congoleum Rugs have always been renowned for the beauty and richness of their designs. And now—six new patterns, expressing the latest trend in floor-covering artistry, are ready for your inspection.

Especially interesting are the two new Chippendale designs, shown first and fourth at the right, which reflect the latest vogue in the most expensive floor-coverings. The small all-over floral motifs, illustrated third and sixth, come in soft tones that make them admirably suited for quiet, inviting guest rooms. A fascinating antique Oriental rug now exhibited in the British Museum inspired the second and fifth designs.

Patterns for Every Room

Don't fail to see these new designs at your dealer's. He has in addition other beautiful Congoleum Art-Rug patterns for you to see in a variety of color combinations that are in perfect taste for any room.

Seamless throughout and absolutely waterproof, these rugs need only a light mopping to make them spotless. They require no fastening yet always cling tight to the floor.

All their artistic and practical qualities make Gold Seal Congoleum Art-Rugs the favorite floor-covering in thousands of homes.

Popular Sizes—Low Prices

6 x 9	ft.	$ 9.00	1½ x 3	ft.	$ .60
7½ x 9	ft.	11.25	3 x 3	ft.	1.40
9 x 9	ft.	13.50	3 x 4½	ft.	1.95
9 x 10½	ft.	15.75	3 x 6	ft.	2.50
9 x 12	ft.	18.00			

The patterns illustrated are made in the five large sizes only. The smaller rugs are made in patterns to harmonize with them.

Owing to freight rates, prices in the South and west of the Mississippi are higher than those quoted.

Beware of Substitutes

Don't be misled into buying some other material represented as *Gold-Seal* Congoleum. Insist that the Gold Seal appear on the face of the goods you buy. It is the only way by which you can be sure of getting the genuine, guaranteed, nationally advertised *Gold-Seal* Congoleum.

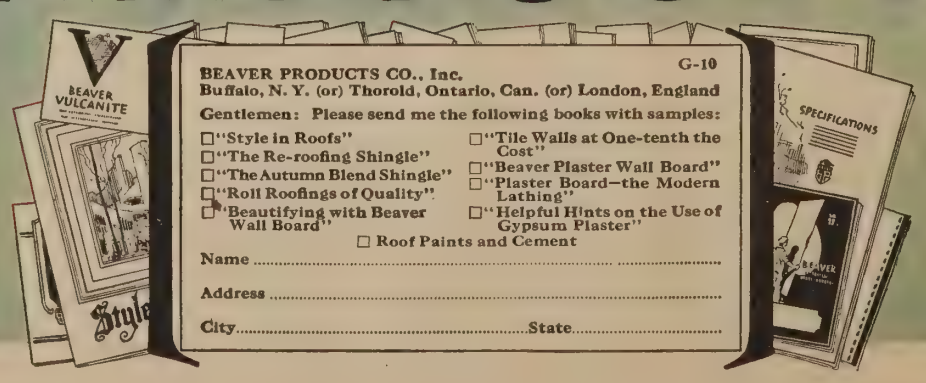
for ROOFS

test it!

—prove the quality of Vulcanite Roofing for yourself

You can be certain that Beaver Vulcanite Roofing will more than stand the tests of cold, heat, wind, rain, ice, snow, fire hazards —or any other natural strain a roof must endure. You don't need to take *anybody's* word for it. You can—and should—prove it for yourself before you spend a cent for any roof.



Write for a sample—test and compare

Let us send you a sample of Slate-Surfaced Beaver Vulcanite. Then give it these daring tests: Twist it. Bend it. Throw it on the floor. Jump on it. Kick it. Scuff it. Lay it on ice. Then pour hot water on it. Leave it on a hot radiator. Lay burning embers on it. Take it with you when you buy. Make every comparison you can. Judge for yourself whether Beaver Vulcanite is the most serviceable and the most economical roofing you can buy.

Your dealer can supply you

Any reputable dealer can supply you with this better-looking, husky, fire-safe roofing for any type of roof or building—rolls, slabs, shingles in various colors or blended shades. Don't forget the tests you've made. Depend on your own judgment. You're the one who saves if you insist on Vulcanite—the one who loses if you don't. Mail the coupon now, for your sample of Beaver Vulcanite.

Look for the Red-Striped Beaver Bag when buying plaster. It is your guarantee of highest quality. Write for Beaver plaster literature.

Beaver Plaster Wall Board

A better plaster wall board. Takes finer decoration. Approved by National Fire Underwriters' Laboratories. Mail coupon for sample and compare the quality.

Why drive a shabby car ?

A new car for $2.30!

"So little trouble to apply that it's a joy to use it!" This is the verdict of Mrs. Miller* after refinishing her Ford with Valspar-Enamel.

"I used less than a quart of black Valspar-Enamel to do the whole body, fenders and top. And it looks fine!"

Any careful man or woman can apply Valspar-Enamel—it flows freely from the brush and spreads evenly. And it costs only a trifle when you do the job yourself.

There are lots of other things and places around the house and barn that would look better for a coat of Valspar-Enamel. Household furniture, woodwork, garden implements, tractors—in fact, all wood and metal surfaces, indoors and out—are protected against the weather, rust and accidents by a coat of waterproof Valspar-Enamel. Made of Valspar Varnish plus finely ground colors, Valspar-Enamels are extremely durable. Rain, mud, gasoline, alkali — none of them dim the brilliant lustre of Valspar-Enamels or cause them to check or crack.

In 12 beautiful standard colors—Red, *light and deep;* Blue, *light, medium and deep;* Green, *medium and deep;* Ivory; Bright Yellow; Vermilion; Gray and Brown. Also White, Black, Gold, Bronze, Aluminum and Flat Black.

Send in the coupon below for samples.

**Mrs. Laura T. Miller, Oswego, Illinois*

The famous Valspar boiling water test

Postscript

If you do not care to refinish the car yourself go to an automobile painter for a professional job. In a few days and at a reasonable price he will refinish your car with Valentine's Automobile Varnishes and return it as bright and new as the day you bought it.

—and Baking Powder does the rest

After you have combined the necessary ingredients—shaped the biscuits—placed them in the pan—then it's up to the leavener. Remember, it can either make or ruin your baking.

The majority of America's housewives know this—they've learned it through actual tests on bake day. That's why they use

CALUMET

THE WORLD'S GREATEST BAKING POWDER

Profit by the experience of others and use the leavener that has given unfailing and economical satisfaction for thirty-five years.

Bakings made with Calumet are uniform, sweet and wholesome. Use it for your children's sake because perfectly raised bakings are easily digested—and that means health.

There is no Substitute for Calumet

EVERY INGREDIENT USED OFFICIALLY APPROVED BY U. S. FOOD AUTHORITIES

SALES 2½ TIMES THOSE OF ANY OTHER BRAND

the simmering point and then either seal it up or put it in glasses and cover with paraffin.

What I like best about this pickle —next to the taste—is that it takes no fancy ingredients and is so easy to make. A couple of stalks of celery ground in with the other things is nice and you may like to put in whole mustard seeds, too, but they are not needed for a good pickle.

Sterilizing a Needle

There are so many times when a mother needs to use a needle to get out the splinters. It is really not safe to take up just any needle from the workbasket in spite of the fact that in the average case no harm results. There are too many times when poisoning sets in to pay us to run any risks.

It doesn't take long to thread a needle with quite a long thread, put it in a small pan of water with the thread hanging over the edge, and boil it for a few minutes. You can then easily remove it from the boiling water without handling the needle and getting it contaminated. I might add that it is a fine thing if you have on hand a bottle of iodine with a glass rod in the cork so that you can follow up the removal of the splinter with an antiseptic. Such things seem trifling but blood poisoning is not.

Spanish Sauce

Before the final frost gets there, rescue some of your garden and make your winter meat sauces. Here is a recipe that goes well with Swiss steak, rice, spaghetti, or macaroni. These proportions were given by the state agricultural college of South Dakota but there is no hard and fast rule in regard to them: 2 lbs. tomatoes, 2 green peppers, 3 onions, 2 stalks celery. Scald tomatoes, skin, core, and chop. Blanch peppers, onions, and celery together for five minutes. Mix all together and pack in jars adding one teaspoon salt to the quart. Add boiling tomato juice to within three-eighths inch of the top of the jar. Partially seal and sterize in hot water bath for two hours or in the pressure cooker one hour at five pounds pressure.

The old fashioned open kettle method of cooking and canning may be used for this with entire success.

Figs for Health

The supply of fresh garden food is getting shorter and shorter and we must be looking to something to take its place if we are to keep well through the winter.

Prunes, of course, are the famous example of a food laxative and they are cheap and good—provided you happen to like them. Some people, however, have a great distaste for them and would almost rather be sick than eat them.

If you have any such persons in your family, try figs for a while. Buy them by the pound dried—either green or ripe—and of course a pound makes quite a good amount.

Wash them carefully. A person whose appetite has to be coaxed is not going to like these foods any better for finding a pebble in them. Soak them over night in water to cover and then simmer them gently in this same water till tender.

I use no sugar on either prunes or figs as we prefer the natural flavor and, besides, most people eat too much sugar. If you eat these fruits solely for laxative purposes, I think that you will find that a small dishful at night will do you more good than at any other time.

Friendly Talks for Farm Folks

Not all the Pool's horses
Nor all non-pooling men
Can seem to make milk
Bring its true price again.

⚜

That dairyman who is against pure-bred cows, tuberculin testing, the farm bureau, the grange, co-operative organizations and progress of any kind can also be marked down as against his own interests, first, last, and all the time.

⚜

The vacation season is once more a closed season, and as we see the thousands of disheveled joy-hunters returning to the daily grind, we wonder anew if they are any happier or richer or more rested than the poor, ploddng farmer who put in ten hours or more a day right through the summer without thought of anything but to get the work done alone.

⚜

Bug Norton says that the hundreds of folks who are trying to better the lot of the farmer have thought of everything to improve his condition except teaching him how to play golf. Which only goes to prove that these folks aren't in earnest at all about helping us hay-pitchers have a nicer, more cheerful time of it, for if they were they would surely show us how to play the game and let us give up farming every afternoon like all the business men and doctors and bankers and so on, do.

⚜

It's getting such hard times down on the farm that if the old wolf comes round to any of our kitchen doors this fall about tax time, he'll be darned lucky if we don't shoot him and make him into a succulent wolf pot-pie.

⚜

"A Farm Woman's Prayer" reads: "Keep ever in my soul a sense of the perspective, that my kettles and dishcloth may not obscure the beauty of the rose blooming outside my door, the quiver of the leaves in the summer wind, and the classic purity of the snow on the valley or hill."

⚜

Harlow Button tells the story of a young couple, neighbors of his years ago, who were so poor that they could not afford a clock during the first few years of their married life. So they would tell the time of day by the sun, work hard and long from sun-up to sunset, and go to bed with the chickens happy and contented on the farm even if they didn't have many worldly goods. This couple got into the habit of getting up mornings in the winter by seeing the light in a neighboring farmhouse. One time on waking and seeing the light across the fields they got up, the woman cooked breakfast, the man milked the two cows and did the chores and after eating they both sat down to await the sun. It did not appear. To their astonishment, the light in the farmhouse across the way suddenly went out. It was ten o'clock at night! Not long after this the clockless couple were presented with a time-piece by thoughtful neighbors. No doubt they thoroughly appreciated it.

⚜

Perhaps we are wrong, but in our opinion the young lady who encourages a husky young shiek from the farm who can handle his mettlesome tractor even better than the real article can a dapple Arab—is going to settle down into a happy wife and mother far removed from the shoddy make-believes of Hollywood. Nobody loves a shiekess, anyway.

Send No Money

FOR THIS DURO SEAMLESS SANITARY MILK PAIL

Bottom and sides are one piece. Both interior and exterior surfaces are perfectly smooth, so there are no seams or crevices to harbor bacteria. The Duro Pail is made of **heavy gauge steel** heavily tinned, and will give a lifetime of service.

The Duro Seamless Hooded Milk Pail is strongly recommended by dairy authorities, for its use prevents dust and dirt from falling into the milk pail during milking.

Duro Pails are made in 14-qt. size only, and weigh 7 lbs. each. They may be supplied without hood when so ordered.

Send your name and address today and the Duro Sanitary Seamless Hooded Milk Pail will be shipped at once. When delivered pay the postman $2.25, (and a few cents extra for postage). Money refunded if at the end of 10 days you are not thoroughly satisfied with your purchase.

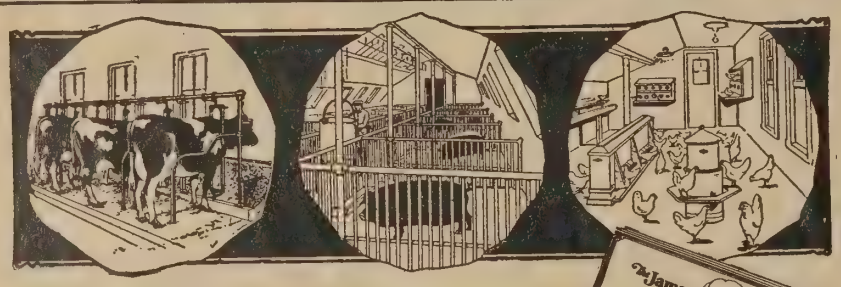
Floors Mean a Lot to Your Cows

WHEN *you* get tired, you can sit in a chair or lie on a bed. But a cow can't sit and, when she lies down, it is on the same floor she has been standing on.



Just remember that when you are wondering what to lay in your stalls. Make it a comfortable floor—easy on the feet, warm, dry, clean. It makes a lot of difference to a cow whether she is uneasy and restless on cold, hard concrete, or contented and comfortable on Circle A Cork Brick.

And it makes a difference to you, too, for cow comfort pays in milk dollars. Circle A Cork Brick floors protect your cows against chill and dampness, against strains and injury from slipping, and against garget and bunchy knees. You are practising *real economy* when you floor your stalls with Circle A Cork Brick.

Write for a sample and the book, "Circle A Cork Brick," sent free on request.

Circle A Cork Brick Floors
FOR DAIRY BARNS AND HOG HOUSES

You Don't Need A Pile of Money

Every Cow—Hog—Hen Farmer Can Use *JAMESWAY* Plans and Equipment

You'll be surprised at how little it costs to own and enjoy a Jamesway equipped, work-saving dairy barn, a sunny sanitary hog barn, or a comfortable, ventilated poultry house to increase your earnings. Write and get our Jamesway "Pay from Earnings" Plan on stanchions, stalls, carriers, water bowls, etc. As little as $10 to $12 per month will give you the finest dairy barn equipment you could want on this plan. And think of the increased earnings, shortened hours of labor, and a more pleasant place to work in!

Equip your hog barn and poultry house on same plan. Think of only $6.00 or $8.00 per month and increasing your egg profits with feed saving, metal self-feeders, waterers, self-cleaning metal nests. Also complete ventilation system. Hens can't help but lay more eggs in such a poultry house.

Our New Jamesway Book Sent FREE—

will tell you how you can have these advantages. Also tells how increased earnings soon pay their cost—and yield clear profits afterwards. If building or remodeling, be sure to get Jamesway plans first. Our local Jamesway man will be glad to call and help you. Write today and mention how many cows, hogs, chickens, etc. you keep.

This New Book Will Tell You—

How to get a good dairy barn.
How to remodel an old barn.
How to get good ventilation.
The Essentials of a Good Cow Stall.
How to give cows pasture comfort in a barn.
How to judge a stanchion.
How to feed cows for profit.
How to insure "safety first" with the bull.
How to make the cleaning job easy.
How to water your cows in the barn.
How to have better hogs and bigger litters.
How to make more money from your hens.
How Jamesway "Pay-from-Earnings" plan pays for your equipment as you use it.
And many other helpful pointers on cow, hog and hen problems.

August Powdered Milk

(Report by U. S. Dept. of Agriculture)

Producers supplying powdered milk plants during August received from $1.50 to $1.95 a hundred for 3.5 per cent milk. These plants pay from 15c to 20c a hundred for skimmilk and from 6c to 18c a hundred for buttermilk.

During August powdered whole milk sold for 50c to 60c per pound as case goods and for 22c to 28c per pound in barrels. Powdered skimmik sold for 40c to 44c per pound as case goods and for 5½ to 12c a pound in barrels. Dried buttermilk sold for 8½c to 6½c a pound in barrels.

September Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5 per cent milk delivered at factories during September is based on reports made by condensed and evaporated milk firms:

Geographic section	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.12	$2.12
Middle Atlantic*	18	1.58—2.62	1.81
South Atlantic	1	2.32	2.32
E. North Central	70	1.45—2.60	1.62
W. North Central	4	1.53—1.65	1.59
North Western	11	1.44—1.66	1.64
South Western	9	1.53—1.88	1.62
United States	114	1.44—2.62	1.66

*Fifty-nine additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-four factories reported prices not determined, and nine reported plants closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for August:

	Range	Ave.
Condensed, per case	$5.20—$6.30	$5.76
Condensed, per cwt.	6.90—11.00	9.23
Evaporated, per case	3.34— 4.45	3.89
Evaporated, per cwt.	7.30—14.00	9.14
Condensed skim, per cwt.	4.00— 7.00	5.77
Evaported skim, per cwt.	1.67— 7.60	3.96

The immediate outlook so far as canned milk is concerned shows some improvement but it remains that dairy markets in general are entering the fall season with heavy surpluses. September holdings of butter in storage were 156,232,000 lbs., an increase of 52 per cent over September 1, 1923. American cheese holdings at 76,431,000 lbs. also represented an increase over last year amounting to 20 per cent. The increase on condensed and evaporated milk stocks September 1 over 1923 was 7 per cent.

League's Pool Price for August

The New York Dairymen's League gross pool price for August is $1.72 per 100 lbs. for 3% milk at the 201-210 mile base freight zone. This is an increase of 22 cents over July. Deductions for expenses in August amounted to 8½ cents and for certificates in indebtedness 10 cents. The net pool price, therefore, is $1.635 and the cash distribution is $1.535.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were weak and unsettled during the week, September 22-27. Sentiment appeared to favor lower prices in the belief that cheaper butter would greatly improve consumption. Production conditions were good and continued to be a bearish factor. Storage holdings showed a slight decrease but not sufficient to improve the situa-

tion materially. Foreign markets were firmer and limited quantities of both domestic and foreign butter were exported.

The average wholesale prices on 92-score butter for the week ending Sept. 27, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Sept. 27 1924	Sept. 20 1924	Sept. 27 1923
	Cts.	Cts.	Cts.
New York	37.4	37.5	45.7
Chicago	35.5	37.2	44.0
Philadelphia	38.2	38.5	46.7
Boston	37.5	38.3	46.5
San Francisco	37.2	38.2	48.3

The receipts of butter at these markets were 12,784,086 lbs. for the week as compared with 12,857,414 lbs. for last week and 11,961,904 lbs. a year ago.

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets fairly firm but irregular during week ending Sept. 27th. Price advances of the previous week at country points appeared somewhat too high and distributing markets failed to follow them. Out of town trade was often heavier than local business in the distributing markets due to more favorable prices there than at country points. Production conditions continued favorable but with a gradual drop in the make apparently under way.

The average wholesale prices on American cheese, style Twins, for the week ending Sept. 27, 1924, for the corresponding week a year ago and for the previous week were as follows:

	Ave. for the week ending Sept. 27 1924	Sept. 20 1924	Sept. 27 1923
	Cts.	Cts.	Cts.
New York	22.0	21.9	26.4
Chicago	20.1	20.0	25.0
Boston	21.8	22.0	27.0
San Francisco	18.3	18.7	26.6
Wisconsin Boards	20.5	20.0	25.7

The receipts of cheese at these markets were 4,542,606 lbs. for the week as compared with 4,448,661 lbs. last week and 4,689,702 lbs. a year ago.

MILWAUKEE, Oct. 6—Butter—Market quoted firm; receipts, 26,537 pkgs., yesterday, 15,572 pkgs. Creamery, extra, tubs, 36½@37c; standards, 34¾c; extra firsts, 33½@34c; firsts, 31@32c; seconds, 29@30c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 40@41c; ordinary firsts (standard cases), 37@38c; miscellaneous lots, shippers' cases returned, candled, 35@37c; seconds, dirties, 26@27c; checks, 25@26c.

Cheese—American full cream, Twins, 20@20½c; Young Americas, 20½@21c; Longhorns, 20½@21c; Daisies, single, 20@20½c; squares, 21½@22c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

NEW YORK, Oct. 6—Butter—Steady; receipts, 5,249 pounds. Creamery higher than extras, 39@39½c; creamery extras, 92-score, 38½c; creamery, firsts, 88- to 91-score, 34½@38c; packing stock, current make, No. 2, 27½c.

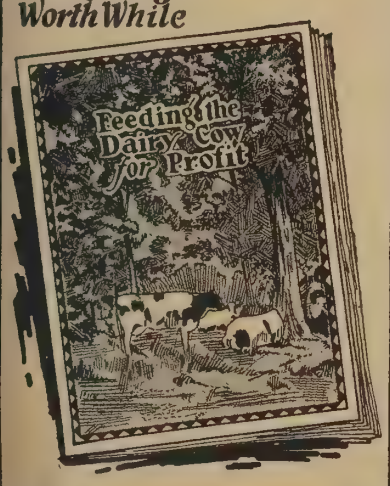
FOND DU LAC, Wis., Oct. 2—Average cheese prices (majority of sales), f. o. b. shipping point: Single Daisies, 20½c; Longhorns, 21c; square prints, 21¾c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Sept. 27: Single Daisies, 19½c. On Farmers' Call Board, Sept. 26: Young Americas, 20c; Longhorns, 20½c; square prints, 21c.

CHICAGO, Oct. 6—Trading in the butter market today was quiet following some support early in the day which resulted in prices remaining unchanged. Supplies were liberal, but not burdensome, however, even with dealers offering all grades liberally at listed prices. The centralized car market was quiet, with a liberal supply of cars, which were offered freely.

Fresh butter—92-score, 37½c; 91-score, 36½c; 90-score, 35½c; 89-score, 34c; 88-score, 32½c; 87-score, 31½c; 86-score, 30½c. Centralized carlots—90-score, 34¾c; 89-score, 33c; 88-score, 32c.

Cayuga County Guernsey Sale



The Fourth Annual Cayuga County, New York, Guernsey sale was held at the D. M. Dunning Farm, September 8th, 1924. The sale was well attended showing proper credit to Cayuga County as a Guernsey producing county.

Although the fifty-three females sold averaged a little lower than last year's sale, yet this was due largely to the large number of young animals being offered. The top price was $1,000 for Lily Calore of Meadow Springs 87110, a six-year-old with an Advanced Register record of 13,911.60 lbs. milk and 589.77 lbs. fat, Class C. She was bred and consigned by Howard Slayton, New York, and bought by the Circle W. Farm, Ohio. The second top price of $525 was paid for Dolly's Chenette of Farview 98251, she too going to Circle W. Farm. She was consigned by W. W. Minard & Son of King's Ferry. The sale was managed by Merryman and Bain was in the box.

The following lists the animals sold for $300 or over and their buyers:

Circle W. Farms, Ohio	
Lily Calore of Meadow Springs	$1,000
Dolly's Chenette of Farview	525
A. D. Robinson, Pennsylvania	
Broadlawn May Queene	$500
Broadlawn Nancy	300
Carrie of Maple Leaf	300
Kyrta's Liberty Bell	415
Charles F. Everson, New York	
Edgemere Mildred	$300
Hallie's Honey Dew	320
Gold Mine's Beauty Dimple	310
H. E. Babcock, New York	
Broadlawn Bessie	$365
Peace of Cornerview	460
W. D. Boyle, New York	
Von Davreeda's Daisy	$350
Chas. C. Wickwire, New York	
Edgemere Frances	$335
Everett & Thompson, New York	
Criterion's Polly of Farview	$300
Wm. Brennan, New York	
Miss Irma's Rose of Valley View	$325
Sweetheart's Thanksgiving of Farview	435
Wm. Judson, New York	
Cherry's Liberty Bond	$375
Levi A. Martin, New York	
Rose's Beauty of Farview	$300

Every Page Worth While

If You Keep Cows You Need This Great Free Book!

Just from the press. Contains many big colored illustrations of today's World's Champion Cows of various breeds—their history, characteristics, records, etc. Shows how successful dairymen choose their milk making feeds and why. This great book is a masterpiece! A single reading will make and save you money. Only a small edition printed.

Get Yours Now

by filling in and mailing the coupon below. Be sure to give the number of cows you own and the name and address of your feed dealer. Then we will forward your copy of "Feeding the Dairy Cow for Profit"—free! You will prize this volume—every dairyman will. Mail that coupon now.

INTERNATIONAL Special Dairy Feed

is fed by farmers everywhere and they get 20 extra quarts of milk from every sack as compared to using wheat feeds or ground grains. We guarantee this increase has been secured in hundreds of actual tests. There is no substitute for International Special Dairy Feed. If your dealer does not sell it, write us.

The Farmers and the Labor Leaders

LEADERS of railway labor unions are carrying on a movement for the Howell-Barkley bill and **for government ownership of railways,** in which they are seeking the support of the farmers.

For the purpose of furthering this movement the labor leaders have issued a "blacklist" of members of Congress which shows that they themselves pay no attention whatever to what the farmers want.

There were both "labor" bills and "farm relief" bills introduced at the last session of Congress. The Howell-Barkley bill was written by the railway labor leaders and was intended by them to increase their power in railway matters. The principal "farm relief" bill introduced was the McNary-Haugen bill.

The Labor Leaders' "Blacklist"

How little these railway labor leaders care for what the farmers want is shown by the following indisputable facts: The labor leaders have "blacklisted" 94 members of Congress. That is, they have told the members of the labor unions that these members of Congress are "unfair" and to vote against them. **Of the Congressmen "blacklisted" 28 voted for the McNary-Haugen bill.**

These railway labor leaders have also "endorsed" 130 members of Congress for re-election. **Of the Congressmen endorsed by them 71 voted against the McNary-Haugen bill and 13 did not vote on it at all.**

These facts show the labor leaders gave no consideration to the farmers or other classes of people in making up their "blacklist." **The only test they applied was how members of Congress voted on the labor leaders' own measure, the Howell-Barkley bill.**

True Purpose of Howell-Barkley Bill

The principal purpose of this bill is to abolish the Railroad Labor Board which now passes on controversies between the railways and their employees regarding wages and working conditions. One-third of the members of this board represent the railways, one-third represent the railway employees, and **one-third represent the public and are appointed by the President of the United States. The Howell-Barkley bill, by destroying the Railroad Labor Board, would deprive the public of all voice in settling disputes between railways and employees.** It would make peaceful settlements of such disputes more difficult and strikes more probable.

The Howell-Barkley bill, by depriving representatives of the public of all voice in the settlement of railway labor disputes, and increasing the danger of strikes, would increase the power of the labor leaders. It would thereby make it much more difficult or even impossible in future for the railways to reduce operating expenses and rates. The principal reason why present railway rates are necessary is the high cost of labor. **The average freight rate of the railways of western territory is now only 38 per cent higher than it was ten years ago. The average hourly wage of railway employees is almost 140 per cent higher.** In view of these facts, do farmers want legislation passed that will increase the power of the railway labor leaders?

What Louisiana Farm Bureau Said

The Howell-Barkley bill will be up for consideration when Congress meets again. The Louisiana Farm Bureau has adopted a resolution saying that "we oppose and condemn the theory and effect of the Howell-Barkley bill" and declaring that "it ignores the rights and interests of the farmers and other shippers."

Farmers in their own interest should oppose the movement the railway labor leaders are carrying on for the Howell-Barkley bill, and **for government ownership of railways, which the labor leaders frankly avow is their ultimate object.**

This is one of a series of advertisements published to give the farmer authentic information about railroad matters. Any questions that you would like to ask will be cheerfully answered. Address:

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Afield in Clubland, Michigan

IT was a raw, dreary October day. The rain was cold and nasty. Not the kind of a day one would pick for a trip through Clubland, but the weather is one of the things that can't be helped. We have to take it as it comes. Nevels Pearson, assistant state club leader for Michigan, and myself were making a visit to that part of Clubland called Hillsdale County, Michigan. We had spent the morning in town and were now ready to go further on our journey.

The county club leader, L. H. Matthias, had scheduled us for a country dinner twenty miles away and rain couldn't keep us from eating. At the same time we would be visiting some calf club boys. So we piled into the club leader's Ford and rattled off through the rain. There were three of us—Mr. Matthias, Mr. Pearson, and myself. Although the weather was stormy, bursts of sunshine came through the clouds all the afternoon as we visited different club members and felt the atmosphere clear up under their sparkling enthusiasm.

HILLSDALE COUNTY HOLSTEIN CALF CLUB MEMBERS ON A SUMMER TOUR

The first boy to the right of the bull picture on the front row is Norbert Walkup. Third to the right on the front row is Hugh Marshall.

We had been delayed during the morning and so it was past the usual dinner hour when we arrived at the Walkup farm. But good Mrs. Walkup had saved our dinners, and after the somewhat long, cold ride, it certainly struck the right spot.

Mr. Matthias had told us that we were going to call upon a very unusual family and indeed we found it so! Nine boys—the four oldest being calf club members belonging to the Wright Stock Club. Another brother was about ready to join and it probably won't be many years before the other members of this large and happy family will be good club boys.

Walkup Brothers, Breeders of Holstein Cattle—this is the title that these boys are planning to use some day before long. We went out to the barn and there—knee deep in fresh, clean straw—we found the beginnings of a very fine Holstein herd—four heifers and their three calves. Walter, seventeen, and the oldest of the boys, was the owner of Spring Valley Betty Own; Norbert, fifteen, owned Spring Valley Tehee Wayne and her heifer calf just a few months old; Robert, thirteen, owned Spring Valley Blackhawk with a small bull calf; Calvin, eleven, owned Spring Valley Irene Ragapple with a young heifer calf. These four boys paid $100 apiece for their heifers and think it was a very profitable investment.

But we haven't introduced all the boys yet—Donald, aged ten, was just waiting for his father to say the magic word that will permit him to belong to the calf club. Harry, eight, Max, seven, Paul, five, and baby Arnold complete the prospective membership of the firm of Walkup Bros.

The calf club quartette introduced the first registered Holsteins into their father's herd. Now that their heifers have freshened they are keeping records of the milk and fat production. Although all are going to school every day, they find time to take care of their animals. Their heifers have all been tested for tuberculosis. This is the fourth year for these boys in club work. Besides their heifer calves they purchased a young bull, Kneedmore Pietertje Pontiac, to head their little herd.

Before we went back to the house, they took me to see their ponies, Betty and Gypsy. The chief duty of these ponies is to see that the Walkup "tribe" gets to school on time daily. Mr. Walkup has built a small shed on the school grounds, a half mile distant, for the express purpose of sheltering these faithful little beasts. At the county fair the boys won a red ribbon on Betty, age fifteen, while Gypsy, her eight-year-old colt, ran away with a blue ribbon on the race track.

From the pony shed we went into the house where the boys took great delight in showing the ribbons they had won. From two consecutive showings at the county fair they had gathered in twenty-seven ribbons. In 1922 all four boys showed and finished in this order—Walter (the oldest) first, Robert second, Norbert third, Calvin fourth. In 1923 Calvin did not show because his heifer was freshening, but the others placed like this—Walter third, Norbert fourth, Robert fifth. Norbert's little heifer calf also won third in the open class.

"WALKUP BROS., HOLSTEIN BREEDERS" MIGHT BE THE TITLE OF THIS PICTURE WHICH WAS "SHOT" AT THEIR STATE FAIR RECENTLY

From left to right they are Robert, Calvin, and Norbert.

Robert Walkup recently sold this young bull but showed him at the 1924 Michigan State Fair, where this picture was taken.

In all, Walkup Brothers won in 1923 something like $22 in prize and club money. The young bull won second in the club class and first in the open at the county fair.

It might be well to mention that these boys are gaining proficiency in judging live stock. Walter won highest honors in 1922 at the county fair, and went to the state fair with his expenses paid. Robert was second, and Norbert won fourth and a trip to the National Club Congress in Chicago.

Our visit at the Walkup farm came to a close all too soon, for we had other club members to call on and the afternoon was already well started. So, bidding the Walkup family good bye, we drove on in the rain. When next we stopped it was at the farm of Mr. Marshall where resided Hugh, aged thirteen, and his sister, Catherine, eleven, nephew and niece of Mr. Marshall, and a couple of "reg'lar" calf club members. Mr. Marshall met us in the yard and explained that on account of the rain he thought perhaps we weren't coming and had sent the children back to school. But we climbed out and went into the barn to look over the calves. They were sleek looking young animals, and showed evidence of having received considerable attention at the hands of their young owners. We were not surprised that they had been prize winners at the county fair. It was nearly time for school to be out, so we decided to go there and meet Hugh and Catherine. As Mr. Marshall wanted to bring Catherine home, he drove ahead of us.

We had not long to wait at the school for soon the boys and girls began coming out. In a minute or two Mr. Matthias had hailed both the juniors in question who climbed into our Ford for a brief visit. Hugh was going to a Freshman party and, of course, was somewhat excited, but had time to tell us that his heifer, Sunrise Ormsby Segis, won two firsts and a grand championship at the county fair and had gone to the state fair and won second in the club class there. Catherine said that her heifer, Sunrise Ormsby Colantha, had been second to her brother's at Hillsdale and won fifth in the open class at Detroit. Both paid $100 each for their calves. Catherine had also had success with a Spotted Poland China pig the year before.

It was growing late. We had a drive of ten miles through the rain and another visit to make before we would head for Hillsdale again. Hugh was going to a party; Mr. Marshall was waiting to take Catherine home. Reluctantly we said good-bye and splashed on toward the Perkins home.

The curtain of dusk was falling over the rain soaked country as we turned in at the Perkins' gate. Dorothy, "sweet sixteen" and mighty attractive, stood on the back porch, bareheaded and clothed in an apron—we had apparently caught her at work in the kitchen.

"Yes, mother's gone and dad and the boys are milking, but come right in. I've been waiting all afternoon for you. I had just about given you up. Thought maybe the rain had kept you away. I'm just awfully glad you came. Come right in!"

We followed her into the house and were soon seated in the parlor having a delightful visit. Before long, Mr. Perkins and the boys came in from the barn. Dorothy's younger sister came in, too, so there was quite a little group of us. Dorothy, bubbling over with enthusiasm, began talking club activities with Mr. Matthias. She brought out a box of club pins that had just arrived and showed them to us. I soon learned that this capable young lady was secretary of the county club organization, and from what I had already seen of her ability, I was convinced that the club members of Hillsdale County had made no mistake in choosing her to fill this office.

"How are the calves, boys?" the county club leader asked. "Fine,"

Norbert Walkup is planning to sell this good looking Holstein heifer. He won prize money on her at the 1924 Michigan State Fair.

Clyde and Clair answered. And then I was told that Dorothy, Ina, Clyde, and Clair each had a nice Jersey calf.

Mr. Pearson then volunteered the remark that Ina was a good little live stock judge and had been third highest in the judging contest at the Hillsdale County Fair. Truly, here was another fine family of club winners.

"I've heard quite a little about your canning, Dorothy. I'd like to see what you've put up," I ventured.

"Would you, really? It isn't much," and with that we all got up and Dorothy led us down cellar. As we came to the shelves of clear, beautifully tinted fruits and vegetables, jellies, and jams, I marvelled at the abilities of Dorothy. Here was a paradise of sweet stuffs for

father and the boys, and a haven of satisfaction and rest for mother and the girls. No need to worry about what to have to eat, nor about the children eating sweet stuffs at school, with all these jams and jellies to satisfy their "sweet tooth".

"How much have you put up, Dorothy?" I asked. "About 815 quarts," was her modest reply. And again I marvelled. Mr. Perkins was as proud as could be of his daughter's accomplishments and handled the jars tenderly as he showed the handsome ones to us.

"Dorothy won first in canned goods at the Hillsdale fair this fall," said Mr. Matthias. "You don't wonder that she won a trip to the state fair on her canning work last year, do you?" "I should say not," I replied with emphasis.

We returned to the front room and as we sat down again, I asked Dorothy if she did any milking. "Yes," she said, "I've milked ever since I was five years old and I like it." Then the county club leader broke in again, "She was third in the milking contest at the state fair last year. She would probably have won if her hands hadn't been bandaged. She had a poison ivy infection early in the week and it kind of handicapped her in the milking contest."

Mr. Matthias then went on and told me that this was Dorothy's second year in club work and that as a reward for her calf club achievements and her general activities she was going to the International Live Stock Exposition at Chicago. "Quite some club girl," I said to myself and audibly to Dorothy I complimented her.

Having noted that the time was getting late we started to go, but Dorothy interrupted: "Won't you stay for supper?" Now, I knew that Dorothy Perkins was a good cook. I had been seeing samples of her handiwork that were deliciously tempting. I was quite willing to accept her invitation, but trains, like the weather, aren't subject to one's commands, so this added pleasure was denied us.

There was much to think about and talk about on that ride back to Hillsdale. Although it was cold and the downpour had not let up all day and we had to stop to put on the curtains and the roads were a wee bit slippery, the sunshine that had come from within at each stop along the road where boys and girls had followed the gleam of the club star, cast a glow of happiness and a warmth of contentment that had almost completely dispelled the outward gloom of wind and storm.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

In the October 3 issue of Hoard's Dairyman you will find three articles which we will discuss briefly here. These are entitled "How Peter Cologna Kept His Boys", "Sewage Disposal for Farm Folks" and "Breed to the Breeders".

Give briefly the experiences of Peter Cologna. Sixteen years ago this farmer found his health failing, his three sons nearly grown and likely to leave him with two hundred acres of timber land on his hands. Almost in desperation he turned to the dairy cow to help him out. The boys agreed to stay and try dairy farming. On borrowed money they purchased their first cream separator and enough stock to start out. Hard years followed, but perseverance finally won. Last year their fancy table butter brought a total income of $7,500.

What is a septic tank? This is the most successful means of sewage disposal for farm conditions. A cesspool is not only out of date but is unhealthy.

How does a septic tank work? Sewage kept in a dark, air-tight place tends to become liquid. When the sewage enters the first tank the solids settle to the bottom and the grease and lighter particles to the top. The second change is the breaking up of the solids. These changes are brought about by tiny organisms known as germs. The liquid then passes over into the second tank from where it is discharged into the tile system.

What takes place in the tile system? The liquid filters through the tile at the loose joints and is spread out in the soil where more germs attack it and make it pure.

How has C. C. Dickson, owner of the Ashburn Herd, increased production 70 per cent in five generations? By breeding cows whose calves would be an improvement.

How does Mr. Dickson measure the value of a sire? By his proven ability to sire daughters that are superior to their dams.

What advice does Mr. Dickson give for improving a dairy herd? First, keep individual production records not for a year but for a lifetime. Second, be merciless in culling.

Junior Letter

Proud of Creed

I received our creed. I keep it in a place where it will not get soiled. Everybody that comes into our house, I show it to. I am proud of it. My favorite dairy breed is Jersey cows. I have not been able to write for some time as I have been busy picking berries and the like. I am anxious to get my other emblem of our club.

There are a few girls around here that I think will join our club if they get the Hoard's Dairyman paper.

I hope to hear from you soon. My address is R. F. D. No. 2, Hornell, N. Y.

Your new junior,
Mary Larkin.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Minister—Do you know where little boys go that smoke cigarettes?

Boy—Sure, down in Flanagan's alley.

Balloon Tires Standard Equipment

This Vibrationless Essex Six Means Longer Car Life—$1000

Freight and Tax Extra

And it also means greater riding comfort.

Unusual smoothness is found in Essex Six performance. Its motor is built on the famous Super-Six principle and with one exception is exclusive to Essex.

Thousands of former larger car owners recognize the wisdom of driving today's Essex Six. It saves $300 to $400 in purchase cost. It saves in operation and maintenance expense. Today's Essex is a revelation to those who do not know its astounding value.

Getting Mules in the Ark

A mule auction took place in a ring enclosure, access to which was by one small gateway, and considerable amusement was caused among the onlookers by the efforts of the men in charge of the animals to get them to go through it. One mule especially seemed obstinately bent on doing anything and everything but pass through that gateway.

"Want any help?" shouted one of the by-standers, as the mule-driver rested a moment.

"No," answered the driver, "but I'd like to know how Noah ever got *two* of these blighters into the ark."
—Everybody's Magazine.

Farm club youngsters grew 23,354 acres of field corn last year with their 17,000 demonstrations under the guidance of county extension agents, according to the U. S. Department of Agriculture.

Senior and grand champion bull—Corium Princess Carrie's Champion. Junior champion bull—Corium Cherub's Edgar.

Senior and grand champion cow—Honey Bloom of the Prairie. Junior champion heifer—Danny's Maid of Fern-Dell.

New York Dairy Notes

HOARD'S DAIRYMAN:—A year ago low dairymen were scurrying around for new milkers and were paying good prices for them. Now the major portion of the farmers seem to be wondering how they can sell their springers at a fair price. It is true that some of the farmers are asking about cows to buy but these are hesitating and wondering if the price of milk will be high. There seems to be a larger proportion of the cows that are coming fresh in the spring and quite often these are the most popular, although not always so.

Last year at this time milk prices for the fluid markets were well up and believed to be there to stay for the winter. They did not stay. Some got the rather high priced cows and then wished they might get rid of them without considerable loss. Now they wonder if those prices will drop again. Milk may bring around $1.85 for the usual test. There are a few dairymen who get something for their milk. They do not pay any of the costs of maintaining organization, yet they wish to know if the organization will maintain their price and they doubt it somewhat. Last year it was not only the Sheffields but many co-operative milk locals that cut prices as I see it. Now it may be mostly the Sheffields that will have to be watched. The local co-operatives may be trying better to refrain from cuts. We hope so.

Fall feeds are now good and we have a very good crop of cabbage. The crop is so good that the price is almost no good. Five dollars a ton is about all that can be counted on now. For those who have cows and not too many cabbages they can market them at the cow stable to some advantage and they will do so unless there is an ample advance in cabbage prices. Ten dollars a ton is what the men who met in our locality last night thought was the lowest that they would sell for. There are men who will prefer to cash in some cabbage at less than ten dollars I suppose.

League milk for August brought $1.635 after expense deductions for 3% test at 200 miles from the city. As nearly as I can figure, the butter price on the Cornell schedule of computation would bring around $1.40. The fluid price to dealers is $2.60 for September, the same as for late August. It would appear that we cannot count over ten to twenty cents more for the September pool than for August. It looks doubtful if we can reckon on any months more than thirty or forty cents for the pool price above butter values and when we sell fluid milk at $1.20 above the butter price it is dangerously high as competitive conditions are at present. The Sheffields are said to be paying their patrons well above two dollars for this month, and I think fully equalled two dollars last month. Most of the Eastern States locals are now understood to be above the pool. If there were no pool these people would find a low market.

There are probably about nine thousand dairymen who by taking an advantage of the sustained market made by the Dairymen's Leauge without helping to sustain it are getting quite a bit above the amount that the League can pay. Then there are some two thousand of the Eastern States members who get something out of it. The other forty thousand or so outside of any of these groups may not be so far from what the League pays. On that statement it might appear that the organization is not of value. The error of that assumption is that none would get even the present returns were it not for the League association, or at least very few.

New York. H. H. LYON.

Virginia Holstein Champion

Virginia's new champion Holstein cow for one year's production of butter as a junior four-year-old is Van Huff Jewel Buckeye, owned by C. E. Gardner. Her record for this period is 23,064.6 pounds milk containing 801.82 pounds butterfat, equivalent to 1,002.2 pounds butter, according to the Advanced Registry Department of The Holstein-Friesian Association of America.—Extension Service, The Holstein-Friesian Ass'n. of America.

JOHN JONES, Sec., Milton Jct., Wis.

Red Strand
(top wire)
identifies this copper-bearing, longer lasting
The Triple Life Wire
Galvannealed
Square Deal Fence
So that you may always know this good fence, we've marked it with a Red Strand. If the fence you buy hasn't the Red Strand then you are not getting "Galvannealed" Square Deal.
Our patented "Galvannealed" process welds an extra heavy coating *of zinc into and around the copper-bearing steel wire.* The ordinary, galvanized method used by others puts on only ¼ or ⅓ as much zinc. Because "Galvannealed" Square Deal has 2 to 3 times more zinc than the galvanized kind, it lasts 2 to 3 times longer.
This longer lasting fence is sold at *no extra price*
A postal brings official Proof of Tests from Indiana State University, Burgess Laboratories and Hunt Laboratories. They show you that "Galvannealed" Square Deal *must* outlast all other farm fences. We'll also send Ropp's Calculator, figures interest, grain, and answers thousands of farm questions — and — the Square Deal Catalog. *Write today, all three sent free to landowners.*

. . . STATEMENT OF . . .
The Ownership, Management, Circulation, etc., required by the Act of Congress of Aug. 24, 1912
—OF—

Hoard's Dairyman

Published weekly at Fort Atkinson, Wis., for October 1st, 1924.

State of Wisconsin, County of Jefferson, ss.

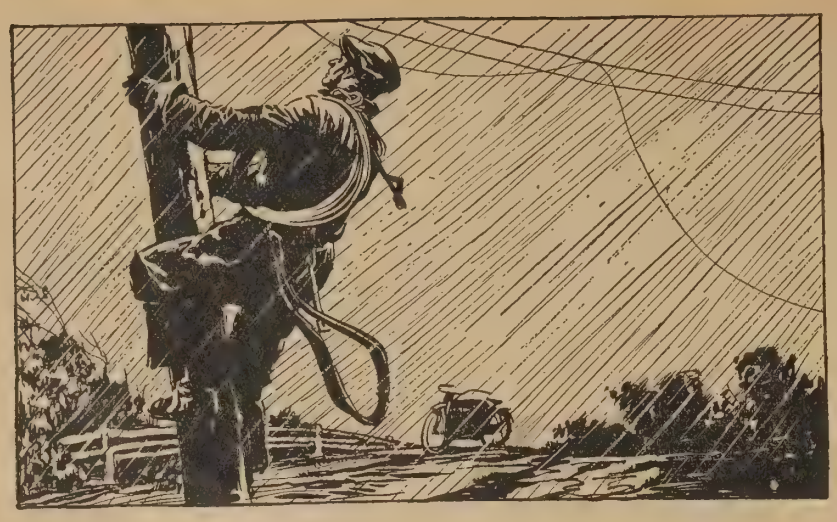
Before me, a Notary Public in and for the State and county aforesaid, personally appeared Frank W. Hoard, who, having been duly sworn according to law, deposes and says that he is the General Manager of the Hoard's Dairyman and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher W. D. Hoard & Sons Co. Fort Atkinson, Wis.
Editors A. J. Glover, P. C. Burchard Fort Atkinson, Wis.
Managing Editor A. J. Glover Fort Atkinson, Wis.
Business Manager Frank W. Hoard Fort Atkinson, Wis.

2. That the owners are: W. D. Hoard & Sons Co., Fort Atkinson, Wis.; H. L. Hoard, Fort Atkinson, Wis.; W. D. Hoard, Jr., Fort Atkinson, Wis.; A. R. Hoard, Fort Atkinson, Wis.; A. J. Glover, Fort Atkinson, Wis.; F. W. Hoard, Fort Atkinson, Wis.; G. W. Rankin, Fort Atkinson, Wis.; M. J. Kerschensteiner, Fort Atkinson, Wis.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.



4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

Signed, Frank W. Hoard, General Manager.

Sworn to and subscribed before me this 1st day of October, 1924.

[SEAL] Signed S. R. Jones, Notary Public. (My commission expires Aug. 26, '28)

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

Keeping the Telephone Alive

Americans have learned to depend on the telephone, in fair weather or in foul, for the usual affairs of the day or for the dire emergency in the dead of night. Its continuous service is taken as a matter of course.

The marvel of it is that the millions of thread-like wires are kept alive and ready to vibrate at one's slightest breath. A few drops of water in a cable, a faulty connection in the wire maze of a switchboard, a violent sleet, rain or wind storm or the mere falling of a branch will often jeopardize the service.

Every channel for the speech currents must be kept electrically intact. The task is as endless as housekeeping. Inspection of apparatus, equipment and all parts of the plant is going on all the time. Wire chiefs at "test boards" locate trouble on the wires though miles away. Repairmen, the "trouble hunters," are at work constantly wherever they are needed in city streets, country roads or in the seldom-trodden trails of the wilderness.

Providing telephone service for this great nation is a huge undertaking. To keep this vast mechanism always electrically alive and dependable is the unending task of tens of thousands of skillful men and women in every state in the Union.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

You Want Fresh Water The Year 'Round

Whether for man or beast—ice water chills, warm water doesn't satisfy.
The only practical way to have drinking water always at the *correct temperature* is to pump it fresh from the well as you need it.
That's why thousands of farmers all over the world are using the

FULLER & JOHNSON FARM PUMP ENGINE

This engine is a simple, compact, practical pumping outfit. Comes complete. Easily attached to any pump. Mounts on any well platform. Does not interfere with windmill. No belts; direct connected, enclosed gear drive. Special design, air cooled; won't overheat; can't freeze. Easy to start. Costs so little to perate, it soon pays for itself. Write for free booklet 17A.

Association Notes by Testers

Licking County, Ohio: Pastures are very poor due to lack of rain and all cows are below normal for this season. In August market milk sold for $2.20 per cwt. and retailed at 10 cents per quart. The creamery paid 39c per pound for fat.—J. O. Froelich.

Manistee No. 1, Mich.: This is the first association in this county. One farmer is whitewashing his barn. Two others are putting in new stalls and floors. Many farms have electric lighting plants. Market milk sold for $3.00 per cwt. The creamery paid 34c per pound for fat in August. —J. Mason.

North Kent, Mich.: One milk house was constructed with a cooling system and ventilator. One separator was found to be losing $4.35 each month through poor skimming. One silo was constructed and another repainted. Due to the high cost of grain only 13 members fed grain with pasture. In August market milk sold for $2.30 per cwt. The condensery paid $1.55 for milk and the creamery paid 38c per pound for fat. —H. Hansen.

Grass Lake, Mich.: The first prize awarded by the Michigan Milk Producers' Association was won by this association, it having the most members present at M. A. C. Dairy Day, August 22nd. Thirteen members fed grain, 12 alfalfa, and 5 silage. A herd of 20 head of pure-bred Brown Swiss was purchased by two members. Market milk sold for $1.60 to $2.75 per cwt. The condensery paid $1.60 per cwt., the creamery 47c per pound for fat in August.—R. A. Hubbell.

Coleman Union, Mich.: This association has just completed its first month and every one is well satisfied. All members are pasturing, while four are feeding green corn and seven are feeding grain. Several members are growing alfalfa, while some have new seedings of it this year for the first time. Two or three members have new sweet clover seedings for pasture this fall and next year. The condensery paid $1.70 per cwt. for milk, the creamery 36 to 39 cents per pound for fat in August.—E. G. Witkovsky.

Tuscola No. 1, Mich.: Cows in general are not producing very heavy in August as about 75 per cent of them freshen during the fall months. Silo filling and bean harvesting are going on in full blast. Oats yielded very well in this section; corn and beans only fair. Market milk sold for $1.69—$1.77 per cwt. The condensery paid $1.50 per cwt. and 39 to 41 cents per pound for fat.—E. R. Bruce.

Columbia, Ore.: Farmers are attempting to organize along lines similar to a labor union in an endeavor to force milk prices upward. Nine hundred and four cows were tested, constituting the largest number ever tested in this district. Market milk sold for $2.10 per cwt. and retailed for 10 cents per quart in August.—W. T. Noble.

Eagle Point, Wis.: One new barn and a large machine shed were built. Two barns were whitewashed. One herd was tested for T. B. and 8 reactors found out of 14 cows, so the owner sold the entire herd. The creamery paid 41 cents per pound for fat in August.—Walter Stimm.

Pierce Co., Wis.: There were 1,977 cows tested in the five associations in this county with 123 cows producing 40 lbs. fat or over. Production is dropping off as cows are drying up prior to fall freshening. The creamery paid 36 to 41 cents per pound for fat in August. Silo filling is about two to three weeks later than usual and corn will make fair silage but will be of doubtful value to crib and feed as a concentrate. Federal T. B. testing for accreditation of herds is being done largely among farmers who have been or are now in a cow testing association. The combined annual report of the six associations in Pierce County last year is now out.—C. Engleman.

Minnesota Cow Testers' Meeting

Twenty-seven testers attended the second annual meeting of the Minnesota Cow Testers' Association, held at the University Farm, St. Paul, Minn., September 3rd, 1924. Professor Earl Weaver of the Iowa State College of Agriculture was the principal speaker on an interesting and instructive program.

A short business session followed. The following officers for the coming year were elected: Charles C. Geddes, University Farm, St. Paul, re-elected president; Harry S. White, Houston, vice-president; and R. E. Jensen, Northrup, secretary and treasurer.—R. E. Jensen, Secretary and treasurer.

Connecticut Valley Cows

An average production of 6,068 pounds milk, 260 pounds fat with an income of $65.56 above feed cost is the record of 200 cows in the fourteen herds which completed twelve months testing in the first year of the Connecticut Valley, Vermont, Association.

Of these fourteen herds, nine averaged over 250 pounds of fat per cow the leading herd being the Red Echo Guernsey herd owned by C. D. MacDonald, which made an average production of 7,943 pounds 5.19 per cent milk, 412.5 pounds fat.

That it paid to own high producing cows is shown by the fact that the income above feed cost was nearly three times as great for those which produced from 350 to 400 pounds of fat as it was for those which produced from 150 to 200 pounds fat.

Twenty-seven cows produced over 350 pounds fat and of these ten made over 400 pounds of fat. The high cow of the association, a grade Jersey owned by H. A. Carlton, in ten months produced 14,362 pounds milk, 595.5 pounds fat.

With the same tester and a full membership every indication points to a most promising second year for this association. Edward T. Leavitt, County Agent.

"There be three things that make a nation great and prosperous—a fertile soil, busy workshops, and easy conveyance for men and goods from place to place."—Francis Bacon.

New Life for Light Plants

Replace your worn battery with a UNIVERSAL. There's one to fit *every* make of plant—Delco, Alamo, Genco, Lalley, etc. We make a generous allowance for your old battery.

Sealed Glass Cell

UNIVERSAL "Nu-Seal" cells come to you *fully charged*. Nothing to do but hook up—it's easy and they are ready for a long life of work.

No Cleaning, Ever

Ample space below the plates holds all the sediment till battery is worn out.

There's a UNIVERSAL Battery made for every job requiring a storage battery—Automobiles, Tractors, Radio, Farm Light and Power Plants. They have proven their dependability in over 20 years of service. UNIVERSAL Hard Plates is only *one* reason for their remarkably long, trouble-free life.

A Rechargeable "B" Battery

A new UNIVERSAL "B" Battery for Radio! Now you can be assured of *constant* clear reception, steady voltage, a stronger, more even flow of current. No losing of stations—no fading reception. A full line of "A" Radio Batteries also. Write for catalogs.

FREE BOOKS

A Tarheel Co-operative Creamery

(Continued from page 363)

gives a pound to each block and pack for shipment.

John A. Arey of the dairy extension force at State College says that this is the only real co-operative creamery in North Carolina. As such it is rendering a maximum of service to the small farmers surrounding Mooresville. The bankers and business men of Mooresville agree that it was the sustaining factor during the days of depression following the war. It sends out its checks big and little all over the territory at the end of each month and these checks have meant much in paying the operating expense of the farm until the big money crops could be harvested and sold.

Each year the creamery stands sponsor for a big community picnic. This year the picnic was held on Thursday, July 31. Between five and six thousand people were present. They all came with well filled baskets and light hearts. A band was hired, with the creamery bearing half the expense. There was speaking in the morning. Following this, the great crowd broke into small groups for lunch. It was an old fashioned picnic, too. Fried chicken, fried ham, sliced boiled ham, sausage, pickles, tomatoes, biscuits, pies, cakes, deviled eggs, and the like were scattered before one in great profusion. Divine grace was invoked, as it had been before the speaking began and the folks urged to help themselves. No second invitation was necessary for the viands were in themselves a sufficient appeal. But there is a limit and soon folks began to break into small groups talking, chatting, and laughing. It was a great gathering of a fine people and they enjoyed themselves thoroughly.

Machine Milking in 1860

That there is "nothing new under the sun", even as to milking machines, is again shown in the following quotation from the Fox Lake (Wisconsin) Gazette of July 26, 1860:

"Among the feats of ingenuity performed by our countrymen is the invention of a machine for milking cows, lately patented, by L. O. Colven of Fallen County in this state. Whoever has read the account given some years since in the Knickerbocker, of the Pentattic Hen Persuader, will find the marvelous properties of that imaginary instrument almost equalled by the real one of which we speak.

"Four sockets receive the four teats of the cow, and the operator seated beside the cow, with the pail between his knees, works two small air pumps, one on each side, which drain the teats by a process like that of nature, drawing out the milk and releasing the teats, alternately, by short intervals of suction. This method has the advantage of the common one in cleanliness, and a still greater advantage in expedition, for it milks three cows at least in the time which would be needed for one if milked by hand.

"A friend who has tried the instrument on his own cows assures us that the experiment was highly satisfactory. The animals did not seem to be incommoded by its operation, or dislike it any more than the usual way."

We have attempted to locate the Mr. Colven spoken of above, but have as yet been unable to do so. There is no "Fallen" County in the United States, and we can only guess that this inventive genius was a resident of New York State. Does anyone know earlier history of the milking machine?

CEMENT

Opportunity Here for YOU!

No section of the country offers the opportunities to dairymen equal to those offered in the South. All over this vast territory, from Kentucky to Louisiana and Florida, there are good farms suitable for dairying—in desirable communities, having good roads, fine schools and nearby markets. These farms can now be bought cheap and, in many instances, on most favorable terms.

Here, available dairy hands can be had at low wages, the mild climate gives green pasturage the year round, thus cutting down stall feeding, and most of the feed stuff required can be raised right on the home farm.

Dairymen in other sections, who are not so well conditioned, will find it to their interest to look into the situation in the South. The L. & N. Railroad will gladly tell you, free of charge, all about the money-making opportunities throughout the territory traversed by the Road. You are invited to write, saying just how you are situated and how you would like to be. Address

G. A. PARK

Louisville & Nashville Railroad,
Dept. H. D. 16, Louisville, Ky.

THE OLD RELIABLE

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Swollen Parotid Gland

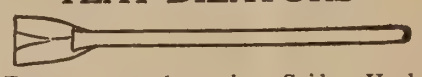
Glands which secrete saliva and discharge it into the mouth to soften the feed and act upon its starchy matters through the influence of an element called *ptyalin,* are located on the throat below the ear and under the lower jaw. These glands frequently become inflamed and swollen from one cause or another. It is quite common for the glands to swell when the animal "catches cold" or has a "sore throat". Such swelling may be mild and comparatively painless, or severe and acutely painful. The latter condition is seen in extensive inflammation of the membranes of the pharynx and larynx, called *laryngo-pharyngitis,* and in a severe attack of influenza. The latter disease is more common in the horse and in that animal an abscess frequently forms in the parotid gland, constituting the condition called *parotitis.* In cows it is also quite common to find the swelling of the parotid gland region due to tuberculosis but in that disease the swelling rarely is hot and sore.

When the swelling comes on gradually, active inflammation apparently is absent and the animal makes a snoring or loud noise in breathing. Tuberculosis is most likely present and the tuberculin test should at once be applied by the veterinarian to decide the matter. In some of the cases of tuberculosis of the part cold abscesses form and pus breaks out or may be liberated by cutting. Such abscesses used to be called "scrofulous" and we have seen many cases of the sort. They are, of course, incurable and affected animals should be destroyed or disposed of in the manner prescribed by state law. When the tuberculin test shows that tuberculosis is not present the veterinarian will make a careful examination for actinomycosis (lump jaw). To determine if that is present he may have to send a sample of pus from the part to the state agricultural experiment station, veterinary department, for laboratory examination. Actinomycosis of the throat usually proves curable by internal treatment with iodide of potash, operative surgery, and external applications of tincture of iodine. Goiter, or enlargement of the thyroid gland, is located much lower than the swellings we have been mentioning here.

When acute inflammation of the parotid gland is ushered in by a chill followed by a high fever and gradual swelling of the gland, on one side of the neck or both, germ infection may be considered the cause. Such a condition is commonly met with in cows and may be termed "mumps". It causes symptoms in every respect comparable to those of mumps in man. The neck is stiff; the swelling intensely sensitive; twisting of the neck (tortcollis) occurs in some cases when one gland is swollen. Swallowing is difficult and for some time may be impossible. Appetite is lost or mastication of feed made difficult so that it stops. Pus tends to form unless preventive treatment is given. Its formation was favored by the application of hot poultices or liquid blisters which used to constitute the treatment. Today it may be aborted by hypodermic treatment with bacterins antagonistic to pus which should at once be instituted by the veterinarian. The swelling should also be painted with tincture of iodine 2 or 3 times daily at first and less often as the swelling abates. Drinking water and sloppy mashes should be allowed.

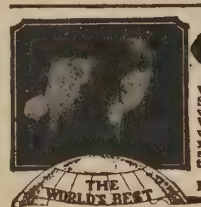
Mammitis

I have a cow that had milk fever this spring. I called the veterinarian and she was up the next morning. About 10 o'clock a. m. she was down again. I had to call the veterinarian again. Is this often the case with milk fever?



Three months later she came in from the pasture limping in her left hind leg. The front quarter on the left side was swollen very badly. The next morning the rear quarter on the same side was swollen hard as a rock and she dried up her milk at once. She had been giving forty pounds. I called the veterinarian at once. He told me to rub her with hot salt water for a half hour twice daily and he also gave me some salve to rub in. Could you tell me what is wrong with this cow and is there any better treatment?

Springfield, Mo. P. R. W.



A cow occasionally suffers a relapse after responding to the inflation treatment of her udder for milk. In that event the treatment has to be repeated.

The udder has been invaded by germs (streptococci) causing a serious attack of mammitis or mastitis, popularly called garget. If the udder is still affected there is little chance that it will function normally at a subsequent calving. Strip it clean every two hours during the day, destroy the milk, and in the evening rub in a mixture of equal quantities of camphorated oil, carbolized oil, and compound soap liniment. A veterinarian might do some good by giving hypodermic treatment with mastitis bacterin. Isolate the cow.

MEDICATED WAX TEAT DILATORS

Can you enjoy a pipe?

Mr. Moxley says he couldn't until he found this tobacco

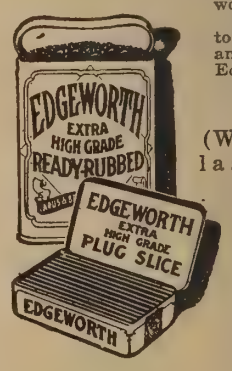
There are smokers of tobacco in other forms who look with envious eyes on the contented and comfortable pipe-puffer.

For there is an obvious peacefulness about pipe-smoking that rests the nerves and invites the soul to calm and pleasant contemplations.

Millions of men do smoke pipes with undiluted satisfaction. Other thousands try a pipe, get their tongues burned, find the draught too strong, or have some other unhappy experience that discourages them.

Our business, in a word, is to make pipe-smoking pleasant and enjoyable to any man that fancies this mode of tobacco incineration. We strive to do this by providing a tobacco that doesn't bite the tongue, doesn't smoke too strong, doesn't leave an after-taste.

But we'll let Mr. Moxley tell it. Here is what he writes:



St. Louis, Mo.,
March 10, 1924.

Larus & Bro. Co.
Richmond, Va.
Gentlemen:

Please allow me to say a word of praise for "Edgeworth." Last fall I thought I would try again to smoke a pipe—so I bought a pipe and a can of "Edgeworth" and can say very gladly that so far I have not had any sore tongue nor do I feel any "after-taste" from smoking. This is more important when you take into consideration that heretofore I had been unable to smoke a pipe on account of the sickening sensation I had afterward, but that is gone forever and I for one am truly glad to be able to get the one good smoke, "Edgeworth".

Give my regards to Mr. Joe Rivers and Mr. James Edmund.

(signed)
Al J. Moxley.

(We infer from the last paragraph of Mr. Moxley's letter that the good lodge brothers Rivers and Edmund are credited with giving him the real inside stuff on Edgeworth. Our acknowledgements to them.)

Let us send you free samples of Edgeworth so that you may prove out all the virtues that its smokers claim for it. If you like it, so much the better for us both. If you don't—well, that's *that!*

Write your name and address to Larus & Brother Company, 57 South 21st Street, Richmond, Va.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound and also in several handy in-between sizes.

We'll be grateful for the name and address of your tobacco dealer, too, if you care to add them.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Ready-Rubbed for the same price you would pay the jobber.

POULTRY On The DAIRY FARM

J. B. HAYES

Fall Suggestions

During the lull that should result during the time between threshing and silo filling, one should devote some attention to the poultry house in anticipation of the fall move. Except on the rare occasions when a poultry meeting is held on a farm, the farm poultry house is a rather neglected article that is allowed to remain as it is until a more opportune time arrives. The unfortunate part of that policy results from the time being postponed from day to day until winter approaches and one is unprepared. A shortage of about one million cases of eggs in storage this year is ample proof that prevailing high feed prices will not be an obstacle in the way of satisfactory returns from the flock.

All predictions seem to show that the unsatisfactory spring has also resulted in a higher mortality in the chicks which will mean a smaller per cent of well matured pullets. From limited personal observations, this fact does not seem to be supported for the number of pullets now on farms seems to be normal. If there are fewer pullets, an early winter egg production will be smaller and prices proportionately higher. Pullets are the source of late fall and early winter production until the hens have completed their molt.

First and foremost in considering the house should be the removal of all unnecessary equipment that clutters the floor. In certain instances enough pots and pans have been seen in houses that varied in size from big iron kettles to sauce pans and in sufficient number to serve as individual drinking cups for each bird in the flock. By the time that all this material was distributed there was no room left for the flock to exercise. One water stand with a vessel of sufficient size is adequate for any flock.

If open roosts that reach from the center of the house to the top of the rear wall are now in use, they should be removed and replaced by a dropping board table and horizontal roosts. In too many cases production may be hindered by the fighting, crowding, and falling that results from the other type. As a second reason, one will find that too much floor space is not available for the flock unless dropping boards are used. Every part of the house should be utilized to the greatest extent.

Dilapidated wooden boxes that were used as temporary nests will make excellent kindling for next winter. The construction of nests in tiers renders cleaning more easy, aids in the regular collection of eggs, and is a big help in the constant warfare against mites. The application of a wood preservative such as carbolineum or waste crank case oil will aid in his fight and also improves the sanitary conditions. All nests should be ranked along the end wall.

Plans are available from numerous sources for the construction of a good dry mash hopper. Working for economical egg production without a dry mash constantly before the flock is like trying to run an auto without gas. Not much success will be attained in either instance. That point is illustrated daily at this season in the culling of farm flocks.

A concrete floor makes house cleaning an easier job. All of the accumulated debris from last winter and the entire summer should be scraped from the floor and followed with an application of some good disinfectant. In those cases where one has a sand or gravel floor, the top six inches should be removed and fresh material hauled in to replace it. The top of the floor should be flush with the wall and above the level of the ground surrounding the house. During a year the dirt floor becomes badly contaminated and possibly infected.

The ceiling and walls should be swept and a good whitewash applied with a spray pump. This is particularly true in older buildings when the boards have become darker. Whitewash can brighten the interior of the coop and seems to react favorably on the flock.

All of the windows need washing and all missing panes should be replaced. Most of the sunlight must be obtained through the glass and the accumulation of years of dirt can act as a successful barrier. The warm fall days are better suited to that work than cold, miserable days in November.

About six inches of fresh, clean straw on the floor gives the finishing touch to a properly equipped house. Too much straw may be as unsatisfactory as none at all. We are anxious to have a flock exercise in getting their feed but we do not want them to starve while attempting to move loads of litter in their search. Clean straw is preferable to dry leaves or similar material because it will not need replenishing as quickly.

There is nothing that is quite as pleasing or radiates as much hustling activity as a poultry house that has been properly prepared and houses the correct number of well developed pullets. Just the satisfaction of ownership is part payment for the effort expended aside from the profit that will accrue from their proper management through the year. Pullets represent an investment at this time that demand the completion of the job before they become a profit paying business.

OUR MUTUAL INTERESTS

This is an unusual year in the butter business.

Government reports show that the present holdings of butter in the United States are nearly 54 million pounds greater than the holdings in September, 1923. Besides this surplus, the daily make is very heavy, and butter is constantly piling up in all the great markets of the country.

Abundant rains—rich pastures—and large increases in the number of milch cows—have combined to produce butter in extraordinary quantities.

While you are striving toward the better production, handling and delivering of cream, our members face the serious problem of selling what you produce.

The situation therefore involves a mutual obligation. Producers must keep up the quality, while we must bend every effort to distribute the large yield.

This Exchange does not handle butter and eggs, but its members deal in them in wholesale lots for both immediate and future delivery. The one purpose of the Exchange as such is to improve marketing conditions, and a branch of our task is to increase consumer outlets.

We will do our best to induce the people in the cities to eat more butter and it is up to you to see that the country consumption of good butter, not substitutes, increases in like proportion. This is for your benefit as well as ours, and we are glad to have a part in serving an industry which gives to the people its *finest food.*

(Continued from page 361)

butter in seven days, and 3,437 lbs. milk and 150.7 lbs. butter in thirty days. Her best day's production was 133 lbs. milk and she averaged 114.5 lbs. per day for thirty days. During the same time her old mother made a seven-day record of 594.5 lbs. milk and 28.82 lbs. butter at eleven years of age.

The Feeding of the Herd

The feeding of any herd has a great deal to do with the production of the cows. Reports of cow test associations contain many examples of what good feeding can do to increase production. No cow should be condemned until she has had a chance to prove what she can do on an adequate ration. We do a lot of talking about the 4,000-pound cow but, as I heard one well known young Canadian Holstein breeder remark, we should get after the 4,000-pound man.

Mr. Wait has long realized that it pays well to feed well and also according to production. Nearly all the feed is home grown. There are two silos on the farm which are filled to the top every fall with corn. Along with the silage is fed alfalfa and clover hay and sometimes sweet clover hay. Mr. Wait was one of the first men to grow sweet clover in that particular district and has used it for many years both as a pasture crop and as a hay crop with excellent results. At the time of my visit the grain ration consisted of 100 lbs. each of bran, shorts, oat chop, wheat screenings, and 30 lbs. of oil meal. This ration was fed at the rate of one pound grain to about four pounds of milk. The cows get about 30 lbs. of silage and 12 lbs. of hay a day, fed morning and evening. At noon the cows are given access to straw, the remainder of which is used as bedding at night.

Although the barn is not a fancy or expensive building the cows are clean and comfortably stabled. Water bowls have been installed and lots of good, pure water is always available. Labor saving devices such as a litter carrier and feed carrier make the work of looking after the herd easier. Mr. Wait milks with a machine and so far it has given satisfaction and there has been no udder trouble due to the milker.

As Mr. Wait does not depend on high prices for breeding stock, the herd is handled on a production basis. The cows are only milked twice a day and the general policy is to have them all freshen within the year. The milk is shipped to Toronto and the supply is therefore fairly even during the whole year.

The Sires of the Herd

Even before milk records had been kept the pure-bred sire had been introduced, and the splendid results obtained have been largely due to the use of pure-bred blood. Mr. Wait was never able to purchase the real high priced stock, but he was always careful to select as good a bull as possible with milk and fat records behind him. By buying when the animals were young, several very well bred bulls of the May Echo Sylvia strain have been used.

Mr. Wait in improving his own herd has helped the community in which he lives. His success has been a striking example to the neighboring farmers. He has sold young bulls from his best cows at ridiculously low prices so that the owners of grade herds might have the benefit, and some very good young heifers have been placed in other herds. He has also endeavored to have the farmers buy their feed co-operatively, and is a director of the fruit growers' association.

Cow testing work could not have a stronger or abler supporter and the history of the improvement of this herd shows the value of a well defined policy of careful selection of the females, pure-bred sires, and good feeding. Although it is not possible to tell definitely to what extent each of these phases of good dairy management has contributed to the improvement, one thing is certain and that is that no definite policy would have been possible without the information made available through the records.

Men of this type, with a vision of the possibilities that can be attained in herd improvement, and who have the determination and perseverance to stay with the job until they reach the standard that they have set for themselves, are a credit to the community, the dairy industry, and the breed they represent. May their tribe increase.

Massachusetts Ayrshire New World's Champion

Names of registered dairy cows do not always denote more than a particular line of breeding, or a trade mark of the farm from which they come. In the case of the Ayrshire owned by Alta Crest Farms of Massachusetts, it seems that the person naming the cow, Alta Crest Destiny, had a glimpse into the future for she now holds the world's championship of the junior three-year-old class of the Roll of Honor. In 300 days she has made 13,068 lbs. of 4.47% milk, 584.44 lbs. of butterfat; dropping a live calf which she carried 211 days of this period. Thus she is awarded one of the Ayrshire Breeders' Association's medals.—Ayrshire Breeders' Association.

Wisconsin Cheesemakers' Report

The annual report of the Wisconsin Cheesemakers' Association is just off the press. It contains the full report of the last convention, including the constitution, by-laws, resolutions adopted, talks and papers, and reports from county associations throughout the state.

Every Wisconsin cheesemaker should have a copy. Any maker who was not a paid-up member last January can get a copy of this report by sending $1.00 to the secretary's office, Madison, for annual dues to the Wisconsin Cheesemakers' Association. The next convention will be held Dec. 10-11-12, 1924, at Milwaukee.

BROWN SWISS

ANNOUNCEMENT
KINNELON FARMS, owned jointly by Warren & Morris Kinney and for thirty-four years the home of pure-bred Brown Swiss cattle, announces herewith a reorganization, change of name, ownership and location.
The entire herd was moved during the month of August, to Lees' Hill Farm, at New Vernon, N. J., with Post Office at Morristown, and will be known henceforth as the Lees' Hill Farm herd. Mr. and Mrs. Warren Kinney are the new owners, Morris Kinney having recently sold out his interest to them.
The management will be the same as heretofore and a constructive breeding plan for the improvement of type and production will be carried on. Brown Swiss breeders are urged to associate the name "Lees' Hill" with "Kinnelon". It means the same blood, backed by the same high records, and under the same intelligent management.

Foundation Females For Sale

We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

WABEEK FARM, Harry Mather, Mgr.
R. 3, PONTIAC MICHIGAN

Marathon Bess Burke 32d

Junior Sire in the Traverse City State Hospital Herd

His dam, Wisconsin Fobes 6th, topped the Erickson Dispersion Sale at $6,800. As a Sr. 4-yr.-old she made 857.59 lbs. butter and 21,052.7 lbs. milk in 305 days. Her best 7-day record is 34.47 lbs. butter and 636.5 lbs. milk and she is now on yearly test with prospect of a large record.

His seven nearest dams average 1108.21 lbs. butter and 24,096.6 lbs. milk.

His pedigree combines type and production in a remarkable degree and his first calves are due soon.

Let us book your order for one of these bulls from a good A. R. O. dam.

CONSIGNMENT SALE!

Of Cow Testing Ass'n Yearly-Record HOLSTEINS

FRIDAY, OCTOBER 24th

50 Head Purebred and Grade Females -- 5 Head Purebred Holstein Males --- One Purebred Guernsey Sire, ready for service

Every animal consigned has either herself, or has a dam that has made the requirements established by the National Dairy Show, in yearly butterfat production. The young sires consigned all have dams that have produced more than 400 lbs. of butterfat per year, some having made these records in heifer form.

All animals consigned will be T. B. tested previous to the sale and sold subject to the 60-day retest privilege. Don't forget Livingston Co. is a T. B. modified accredited County.

All records made have been made under the supervision of the Dairy Department of the Michigan Agricultural College.

This is a rare opportunity for farmers to get started with foundation stock that has proven their value as producers.

ELISHA BAILEY & SON - - PITTSFORD, MICHIGAN

He threw away his butter-fat

Let this Iowa story throw some light on your farming profits

A PROMINENT farm paper tells about a Corn Belt farmer who purchased a separator at public auction for $11.00. He was congratulating himself on his thrift, when along came an Association Tester. The "bargain" was tested. The test disclosed that $7.60 worth of butter-fat had slipped by into the skimmed milk.

No State or Government inspector comes around to test the lubrication of your automobile, truck or tractor. If there were lubrication inspectors there certainly would be even more farmers who use Gargoyle Mobiloil.

"Bargain price" oils or low-cost lubrication?

Cheap oils are just as uncertain and expensive to use as cheap separators. That is why practically every manufacturer of automobiles, motor trucks and tractors endorses the Gargoyle Mobiloil Chart of Recommendations.

These experts *have* inspected thousands of automobile engines. They know that over half of all moving parts wear out prematurely because of incorrect lubrication. They know that millions of horsepower are lost every year because of incorrect oil. They know that correct lubrication would save millions of dollars of farm profits which now get away because of unnecessary repairs and replacements.

Consumers, too, have discovered that Mobiloil is the cheapest oil at any price. "Suppose it does cost more by the barrel," they say, "*It also costs less by the year.*"

Gargoyle Mobiloil is made by a company which for more than 58 years has specialized solely in lubrication. That is why the Chart of Recommendation is the accepted scientific guide to low cost lubrication.

The chart is shown here in part. If your automobile, motor truck, or farm tractor is not listed in this partial chart, see the complete Chart which hangs on the dealer's walls. Or write our nearest Branch for our booklet "Correct Lubrication."

Tractor Lubrication

The correct engine Lubrication for the Fordson Tractor is Gargoyle Mobiloil "BB" in summer and "A" in winter. The correct oil for all other tractors is specified in our Chart. Ask for it at your dealer's.

GARGOYLE

Mobiloil

Make the chart your guide

Chart of Recommendations

(Abbreviated Edition)

THE correct grades of Gargoyle Mobiloil for engine lubrication of both passenger cars and motor trucks are specified in the Chart below.

How to Read the Chart:
A means Gargoyle Mobiloil "A"
B means Gargoyle Mobiloil "B"
BB means Gargoyle Mobiloil "BB"
E means Gargoyle Mobiloil "E"
Arc. means Gargoyle Mobiloil Arctic

Where different grades are recommended for summer and winter use, the winter recommendation should be followed during the entire period when freezing temperatures are experienced.

The Chart of Recommendations is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and represents our professional advice on correct automobile lubrication.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 14 Fort Atkinson, Wisconsin October 17, 1924

When

Does It Pay to Buy Protein?

Prof. Morrison of the Wisconsin Station says: "Often farmers do not purchase protein-rich feeds such as linseed oil meal, to balance their farm grown feeds, because these protein-rich feeds cost more per ton than corn, oats or bran. They do not appreciate the large amounts of protein in these feeds and unwisely look upon them as 'too expensive.' Protein is the key to the whole ration and under conditions can be bought at great profit in the form of linseed meal. Its purchase may be well compared to the buying of lubricating oil for an engine: Oil costs more per gallon than gasoline, but who would attempt to run a gasoline engine alone without enough oil?"

Just WHEN it pays to buy protein depends upon the protein. With linseed it is usually ALL the time. But that is discussed fully in the book described below.

What Linseed Oil Meal Is and What It Does

1. It pays large returns on the investment.
2. It is rich in protein.
3. It is a mild laxative, mucilaginous and soothing.
4. It is safe.
5. It is palatable.
6. It can be profitably fed to all farm animals.
7. It makes mellow hides and silky hair.
8. It is widely used for cows on test; lengthens lactation.
9. Extensively used for fitting animals for show.
10. It improves the thrift of animals.
11. It lessens the time needed to fatten stock.
12. It saves a large bulk of other feeds.
13. It is contained in nearly all good mixed feeds.
14. It is highly digestible.
15. It helps make other feeds more valuable.
16. It greatly increases the value of the manure.

This Book is Yours—

—yours for the asking.

Written by Prof. F. B. Morrison, Asst. Director of the Wisconsin Agricultural Experiment Station and Prof. of Animal Husbandry at the Wisconsin College of Agriculture. Prof. Morrison is also internationally known as an authority on feeding through his authorship with W. A. Henry in the famous book, "Feeds and Feeding." You'll find this a very practical feeding guide, which discusses the subject in all fairness, and gives many valuable suggestions as to rations for all farm animals. Write for your copy now. Ask for booklet T10.

Balance the Ration with Linseed OIL MEAL Costs Little—Earns Much

It Pays As We Can Readily Prove:

Profit With Dairy Cows—The tester of an Iowa Cow Testing Association found that in one month after Linseed Oil Meal was added to the ration, there was an increase of 1,103.2 lbs. of milk and 49.2 lbs. of fat from only eight cows. Figuring fat at 62 cents a pound, the gain in fat amounted to $30. The Linseed Oil Meal cost only $7.35. Thus there was a profit of $22.65 in feeding the oil meal. The tester says, "When one can buy linseed oil meal at 2½ cents a pound and by feeding it to a cow get over 10 cents a pound for it in the form of butter-fat, I can see no reason for anyone milking cows not feeding oil meal."

Profit With Swine—Prof. F. B. Morrison, Asst. Director of the Wisconsin Agricultural Experimental Station says, "We have found a ration containing no skim milk or other dairy by-products, which gives just as good gains with young fall pigs as when these dairy feeds are used. This helps solve the fall pig problem for many farmers. Young pigs have been taken right from their mothers in the fall at 8 or 9 weeks of age and put on a ration of corn, linseed oil meal, tankage and chopped alfalfa, and have excelled in gains pigs fed on yellow corn and skim milk. We found that a ton of linseed oil meal was actually worth $85, without giving credit for the 29 days saved in getting the pigs to market weight."

Profit With Sheep—In a recent Nebraska experiment Linseed Oil Meal proved worth $53 a ton in fattening lambs.

Profit With Beef Cattle—In a recent Minnesota experiment Linseed Oil Meal showed a profit of $12.79 a ton in fattening baby beeves.

And so it goes—splendid profits are obtained in feeding all farm animals this rich proteid and splendid conditioner.

Makes Your Own Feed Worth Much More

Linseed Oil Meal has been aptly compared to a carburetor. With it you can adjust the ration. By adding it here and there in the rations it helps to balance those rations fully and make full use of them. Furthermore, being slightly laxative, it helps the animal make better use of his feed and keep him in all around better condition.

What If *You* Should Make 50% on the Investment?

—you'd think it a pretty good investment wouldn't you? You can often do better than that—in buying and feeding Linseed Oil Meal. It's an investment—not an expense. But don't take our word for it—send for Prof. Morrison's book for proof of its worth.

Send for your free copy of Prof. Morrison's book.

A TRIP TO THE BRITISH AND CHANNEL ISLES

O. E. REED, Michigan Agricultural College

THE writer had the pleasure of spending some time recently on the British Isles and Channel Islands. A trip of this kind is full of interest to anyone interested in agriculture, particularly if interested in live stock. It is a well known fact that most of our breeds of live stock originated on the British Isles. This fact is of interest today because these islands for the past century have been the seat of great industrial enterprises and conditions have been made favorable for the development of the industries, while agriculture during this time has ranked secondary in importance. One of the big factors which has encouraged the breeding of live stock and the continued development of the various breeds for the past half century has been the demand for good breeding stock from America. It may be stated here and now that for the most part the breeders in America are making greater advancement with most of the English breeds of live stock today than is being made in the land of their origin.

The keeping of live stock is fundamental in a permanent agriculture. Such has been the history of agriculture in the British Isles. Breeders of live stock must first of all be good farmers and this is evident on every hand in England and Scotland. The English farmer may be compared very favorably with the best farmers in America but he is not as good as the farmer in Scotland. The contrast is quite noticeable as one crosses the line into Scotland.

In traveling through the cities as well as through the rural districts, the first impression of superior live stock is manifested by the sight of many excellent horses. The automobile and truck have not replaced the horse in Great Britain in the same proportion as in the United States. A heavy duty on automobiles and the high price of gasoline make it more economical to use horses than automobile power. The great stocky Clydesdale is to be seen on every hand. Other types are also present but in Scotland the Clyde is seen almost everywhere.

The live stock in the British Isles was greatly depleted during the war but it has come back to about the pre-war level. The ministry of agriculture on completion of their survey in 1923 reported that "the stocks of cattle are back to the pre-war level, and as the number of cows and heifers in milk or in calf is the largest on record, the increase is likely to be continuous and it is to be hoped progressive".

Practically every breed of dairy cattle known is to be found in England today, but the dominant breed is the pedigreed and non-pedigreed milking Shorthorn. Many of these cattle impress one as about the equal of the common Durham cow seen on the average farm in the corn belt of America, but they produce a larger quantity of milk. There are many Holsteins (called Friesians), Jerseys, and Guernseys found scattered over England, while the Friesian, Shorthorn, and Ayrshire represent the dairy breeds in Scotland. In Ireland the Shorthorn is gaining in numbers on account of the stimulation given to this industry by the government. Many government owned bulls have been placed at the disposal of the Irish farmers and a great development is being made in improving their live stock. The dairy qualities of the non-pedigreed have been improved through a slow process of selection by the farmers as she is in more general use than other breeds.

The Ayrshire is the only strictly dairy breed, as we know them in America, to originate in Great Britain. They are found in Southwestern Scotland where they originated. This breed has been making great progress in recent years and they are now spreading over Scotland and much interest is being manifested in the breed in England. Many dairymen in England are buying Ayrshire cows for their dairies. The Ayrshire Breeders' Association has been doing some effective breed extension work during the last few years. They have encouraged the establishment of Ayrshire calf clubs in England and their greatest strike has been the entry of the representative Ayrshire cows in the dairy competition at the London Dairy Show. The first exhibit was made in 1922, and their showing attracted much attention. They made another entry in the 1923 Show and carried off most of the honors in the milking contest. The six cows entered stood first in competition with representatives of eight breeds. The writer was able to gain considerable knowledge of the Ayrshire breed in its native country in purchasing cattle for an importation into America.

There has been comparatively little written about the efforts made and the results obtained by the Scotch in the development of their native cow. The achievements of the people in this section stand out as evidence of the value of concentration on one breed of cattle in any section of a country. The red and white cow predominates and can be seen on every hand; they have spread from a small area in the shire of Ayr throughout the southwestern part of Scotland. The Ayrshire now predominates in Kirkcudbrightshire and Dumfriesshire and are sought for by dairymen in the central and eastern part of Scotland. Within a radius of four miles of Drongen, a small village a few miles east of Ayr, there are more than 4,000 registered Ayrshires. The herds range in size from 25 to 250 cows. Kirkcudbrightshire and Wigtownshire to the south are the native home of the Galloway cattle but during recent years the Ayrshire has been taking the place of this breed until to day the exponents of the Galloway are fearful that their breed will soon become extinct in their native haunts.

Dairying thrives in this section of the country. The milk is used for cheese making almost entirely and the whey is utilized in making pork. A Cheddar type of cheese of very high quality is manufactured by the women on the farm.

The cows are left out in the pastures for eight to ten months of the year and 90 per cent of the cattle never get any grain while on pasture. In the words of the Scotchman, "The cows get what they pull". During the winter months (from December to February) the milk cows are usually stabled and are fed straw, hay, and cow turnips with a little oil cake in the best managed herds. The heifers usually run outside the year round. The pastures are exceptionally good. One would naturally expect the grass to be good with the great amount of rainfall they get in that country, but moisture alone does not make luxuriant pasture. The Scotch farmer takes care of his pastures for they are his greatest asset. He feeds them with barnyard as well as commercial fertilizers and consequently pastures get better instead of poorer from year to year.

Dairy cattle are higher in value in Ayrshire than in the United States. Good, unregistered cows were selling during July and August at public auction for 35 to 40 pounds ($175 to $200), while cattle of equal merit in America were selling for $80 to $100. The prices received for dairy products are practically the same as in the United States. The only way to explain the great difference in the valuation of cows then is that the cost of production as far as labor and feed (on account of the excellent grass) is much less than in America.

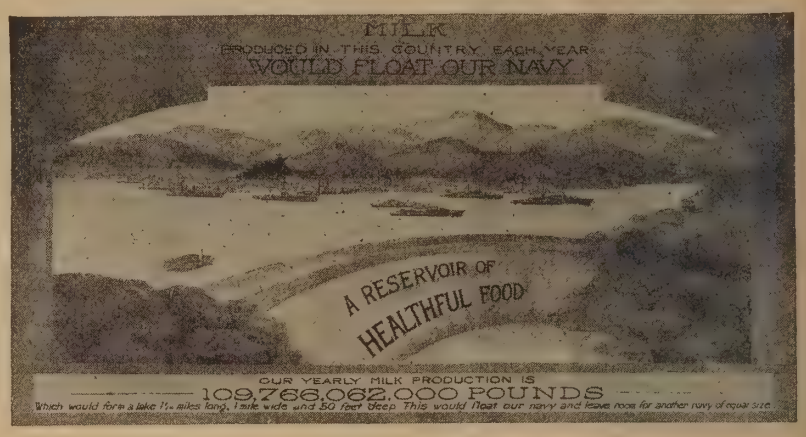
Several years ago the Scottish Milk Record Society was formed for the purpose of keeping records on the cows. Local organizations were perfected very much on the same plan as our cow testing associations in the United States of America. A part of the expense of these associations is

(Continued on page 426)

DAIRY SCENES IN SCOTLAND, THE HOME OF THE AYRSHIRE

THE 1924 NATIONAL DAIRY EXPOSITION

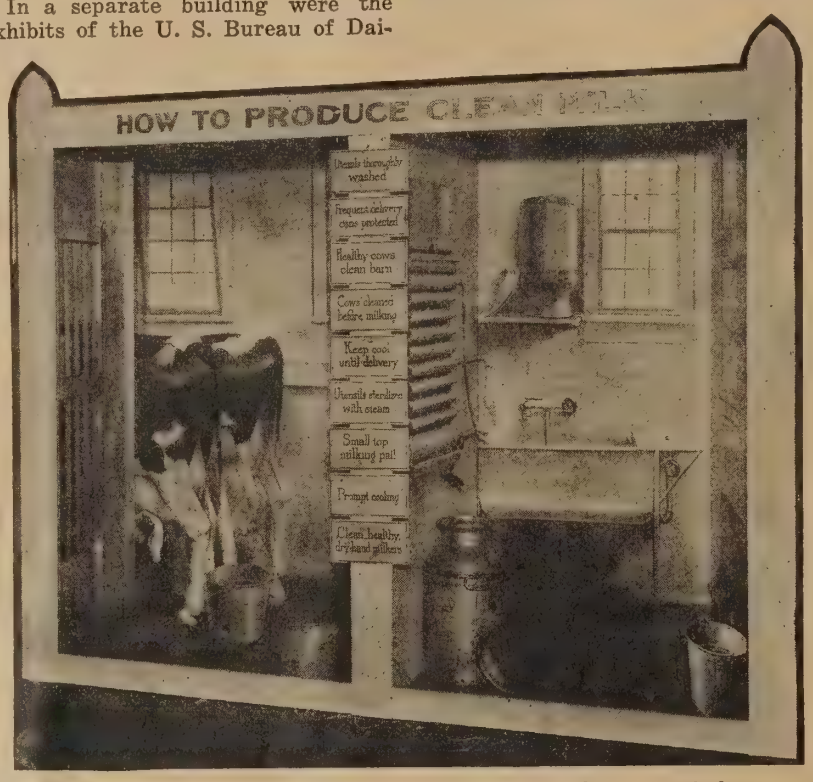
THE Eighteenth Annual National Dairy Exposition held at Milwaukee, Wis., September 27th to October 4th was better than any of its predecessors because it had more demonstrations and exhibits of interest and value to the dairy farmers. It had more lessons for the breeders, more for the boys and girls, more for leaders and scientists, and more for all. It is not a stereotyped expression to state that the 1924 Dairy Exposition came nearer meeting its opportunities and fulfilling the vision of its organizers than any previous exposition. The various educational exhibits and demonstrations challenged the imagination and stimulated sound thinking. Its many parts when brought together presented the greatness and the bigness of the dairy industry.



The record cow exhibit, unfortunately called the grade cow exhibit, consisted of 200 grade cows of splendid dairy conformation and with an average record of nearly 400 lbs. of fat. This exhibit was beyond the understanding of most people, for it was only the student of dairying who comprehended its meaning and purpose. It was only yesterday the best thinkers in dairying held that a cow that would produce 250 lbs. of fat in a year was as good as we could hope to develop. But here we found in the record cow exhibit 200 cows averaging 150 lbs. more fat than the standard of fifty years ago. Is it any wonder only a few people who saw these cows fully comprehended their meaning?

Then there was the Guernsey exhibit showing Glenwood's Miss Greta and her family. Twenty-five descendants from one cow, all strong, capable, and outstanding individuals. Segis Pietertje Prospect, champion milk cow of the world, and Cedar Lawn Canary Paul 6th and ten of his record daughters were found in the Holstein section. The Jersey exhibit showed economical production and the cows in the demonstration were averaging daily 38 lbs. milk containing close to 2.0 lbs. fat. The breeder, the dairy farmer, and everyone interested in dairying could draw useful lessons from these exhibits.

There were many educational exhibits but one in particular we believe was full of meaning for the dairy industry. It was made by the American Institute of Baking, showing by groups of rats the increased nourishing properties of bread when skimmilk instead of water is used in making it. The two important elements in skimmilk valuable for bread making are mineral salts and protein. Skimmilk is rich in mineral salts which are important elements in our diet. Wheat flour is deficient in these substances, and by using skimmilk in bread making enough mineral salts are provided to produce strong, healthy rats. Skimmilk provides a perfect protein, an important supplement to wheat protein which is incomplete. In short, bread making offers opportunity to use millions of pounds of skimmilk and by so doing our bread becomes more nearly a balanced food. Skimmilk does not supply sufficient vitamins to permit rats receiving only skimmilk bread to reproduce themselves. But the natural and common way to eat bread is with a thick spread of butter. This is entering into a detail which perhaps does not belong in a general write-up of the Dairy Exposition, but we make mention of this exhibit as it illustrates what the Dairy Exposition is doing to further the development of the dairy industry and because we comprehend the great value of skimmilk for making bread.



U. S. D. A. Better Dairy Exhibits

In a separate building were the exhibits of the U. S. Bureau of Dairying. Last year when we viewed the exhibit of this great institution at Syracuse we could not conceive the changes possible to make this better. But this year it was something entirely different, and yet withal most educational, and extremely attractive.

Do you realize the vast size of the milk industry? Think of producing enough milk to float the U. S. navy! The value of dairy products, if applied to the public debt of the United States, would pay it off in ten years. Value of dairy products in 1923 was $2,566,000,000. Public debt on June first, 1922, was $22,964,000,000.

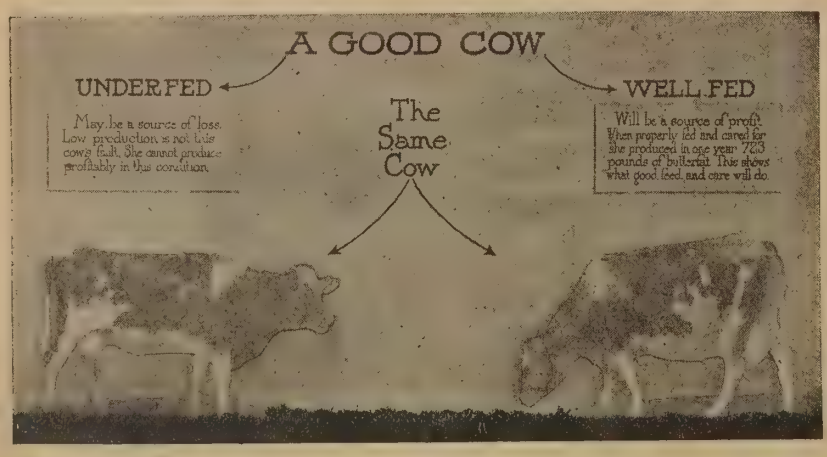
The main messages were carried in a series of panel booths. The desirable feature about this form of exhibit is that it lends itself so admirably to

This booth tells its own story illustrating sanitation in both barn and milk house.

The illustrations on this page are made from photographs of the exhibits prepared by the Bureau of Dairying, U. S. Department of Agriculture.

tention and carry home in a brief yet forceful way some facts you should know. Mr. Hiscocks, who is in charge of this exhibit, informed us that many visitors copied the information given in their note books. He also said two or three exhibits of dairying have been traveling the fair circuits this year.

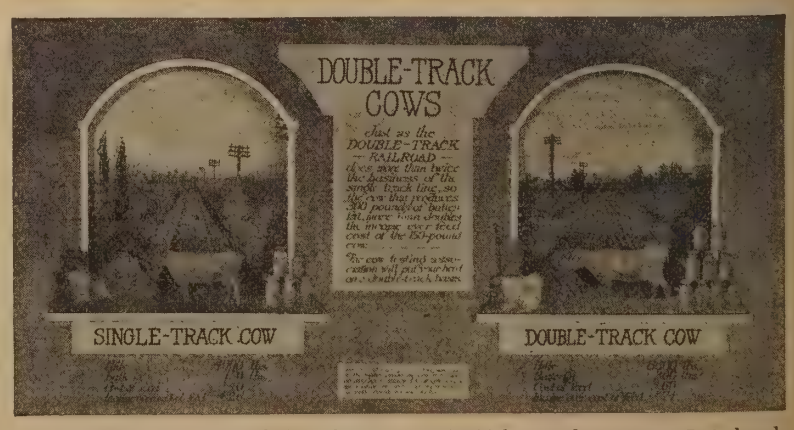
The fact that this exhibit had an entire building practically, made it possible to display the material to fine advantage. Five central ideas dominated the general make-up. These included groups of the following: Better Cows—Why We Need Them; Better Cows—How to Get Them; Better Care of Dairy Animals; Better Dairy Products; Organization.



One of the first exhibits to get our attention spoke of the need for culling and illustrated this need with the old Biblical story, "And the seven lean and ill-favored kine did eat up the seven fat kine". So it was with the farmer who found he had seven profitable cows and seven unprofitable cows.

Another exhibit revealed the fact that pasture crops furnish nearly one-third of all the feed at one-seventh the cost. Therefore they should receive better care.

Dairy Council Exhibits Educational



The exhibits of the National Dairy Council occupied about 8,800 square feet of floor space and showed in detail the activities of the Council and its affiliated units. Mr. M. D. Munn, president of the Council, took time to explain each exhibit and its purpose.

A broadside of panel booths showed the many educational features, including: health plays to interest school children in following

When underfed she produced in one year:		When well fed she produced in one year:	
Milk, lbs.	3,026	Milk, lbs.	7,202
Fat, lbs.	133	Fat, lbs.	359
Feed cost	$33.41	Feed cost	$60.40
Income over feed cost	$16.36	Income over cost of feed	$105.00

Feeding well pays, as shown by this illustration and by other cows in the cow testing association to which this cow belongs. The herd that ate the least per cow in the association produced the least milk and fat and had the lowest income over cost of feed. In the same association the herd that ate the most per cow produced the most milk and fat and had the highest income over cost of feed.

This exhibit shows the relative advantage of the higher producing cow. It is based on averages obtained from cow testing association records and represents varying conditions and prices. The legends accompanying this exhibit are as follows:

Double-track cows. Just as the double-track railroad does more than twice the business of the single track line, so the cow that produces 300 lbs. fat more than doubles the income over feed cost of the 150-lb. cow. The cow testing association will put your herd on a double-track basis. Single-track cow: Milk, 4,000 lbs.; fat, 150 lbs.; cost of feed, $40; income over cost of feed, $26. Double-track cow: Milk, 8,000 lbs.; fat, 300 lbs.; cost of feed, $60; income over cost of feed, $74. Association herds show increased production each year. Yearly average per cow in all associations with records available for first 5 years of testing: First year, 236 lbs. fat; 2nd year, 257 lbs.; 3rd year, 277 lbs.; 4th year, 284 lbs.; 5th year, 294 lbs. What testing has done for others it will do for you.

MICHIGAN COLLEGE CHAMPION DAIRY CATTLE JUDGING TEAM
Left to right: J. E. Burnett, coach; E. S. Weisner, R. P. Britsman, F. H. Williamson.

FARMERS' DAIRY CATTLE JUDGING CONTEST
This occasion took place in the building that housed the record cows. It was the first time in the history of the National Dairy Exposition that the dairy farmers had an opportunity to measure their skill as judges of dairy talent. Twenty-four teams participated in the contest.

health rules, health stories for children, health teaching helps for teachers, food facts for grown-ups, quality control work, ways of using dairy products. In a special booth at certain hours health chalk talks by Miss Lucille Philbrook alternated with cooking demonstrations of dairy dishes and brought a crowd of onlookers at all times. Sixteen films were shown in the moving picture booth. A most striking exhibit consisted of the animal experiments conducted by Dr. Palmer of University of Minnesota, in which it was visibly demonstrated that milk and butter contain a certain something that is essential in the growth of growing animals and which is not supplied in other foods. Puppies, rats, mice, and chickens were the subjects.

Something which we believe a large number of Hoard's Dairyman readers are interested in is the quality control work done in the producing end of the business by the Dairy Council. Through an interview with W. H. Harper of Philadelphia we learned of the more important things he is doing. "About 20,000 members in the Interstate Milk Producers' Association live in four different states, and ship their milk into Philadelphia," says Mr. Harper. "We have eleven field inspectors in this unit and they have inspected some 12,000 farms up to the present time. In the past six months they have inspected 211 receiving stations. The message of clean milk production is being put over by inspection and organized meetings. The farmers adopted the following regulations:

"In the barn inspection we insist that there be enough light, the interior be whitewashed, there be a good ventilation system, and that there be an adequate drop behind the cow to take care of the manure properly. With regard to utensils we require the small top pail, dry hand milking, and proper cooling. Farmers should have a milk house. We insist upon their having a can rack upon which to turn cans upside down when returned from the factory. With regard to transportation it is absolutely necessary that they have a covering for the cans during the haul. We also insist that they solder all small holes in the tops of their cream cans.

"Both farmers and dealers in the Philadelphia milk shed realize the importance of clean milk. The dealers are also organized and have their regulations. The clean-up campaign is thus run co-operatively between the producers and the dealers and the Dairy Council follows up the work.

"Dealers must have covers over receiving tanks. They must have only sanitary pipes in their receiving stations—pipes which can be taken apart each day and washed and sterilized. They must have sanitary cooling equipment. The cans must be thoroughly washed and dried before leaving the plant. As evidence that this work is effective, inspectors at the receiving stations are turning down only six or seven cans a day as contrasted to 60 or 70 a short while ago."

It may interest you to know that there are 105 workers in the National Dairy Council and its branches at present. About 26 representatives were at the National Dairy Show. M. O. Maughan is secretary of the organization. C. I. Cohee is director of the quality improvement department.

Feeding the Family

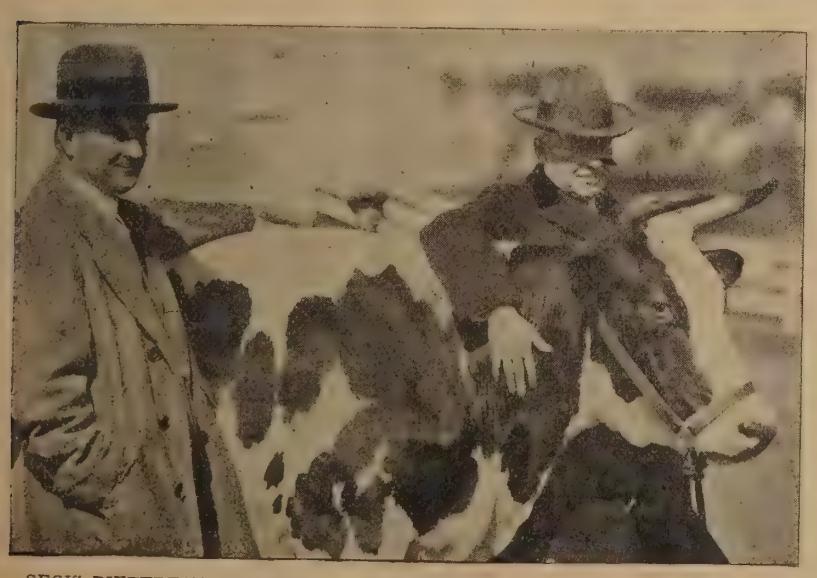
In the same building with the Dairy Council exhibits was a new feature of the Dairy Show, Feeding the Family. President Van Norman secured the co-operation of twenty social, civic, and educational organizations in presenting this big human welfare feature. Several groups of school children put on milk and health plays, in costume, that were watched by large crowds every day. Under the direction of women specialists from the Wisconsin College of Agriculture, a dairy dishes contest was conducted daily in which Milwaukee housewives and others competed. The cheese spread was also demonstrated and visitors were treated with this delightful delicacy and given the recipe.

Finding the Fountain of Youth

Right alongside of Feeding the Family was a masterpiece called "The Fountain of Health is the Fountain of Youth", prepared by the Wisconsin College of Agriculture under the direction of K. L. Hatch and other specialists. The story told by a succession of small exhibits was so fascinating and wonderful that we are publishing the legends of the several exhibits erected to show how human beings have sought health and youth through various agencies:

Exhibit No. 1 showed Ponce de Leon beside the flowing water in Florida and which he thought was the fountain of youth. "He braved the terrors of an unknown wilderness with the hope that he might drink the magic waters which would restore bloom to the cheek, sprightliness to the step, and brightness to the eye. His search was in vain. He found it not."

Exhibit No. 2 was a group of several drugs supposed to possess the properties of eternal youth. The legend of explanation is as follows:



"Then came the age of medicine. Men put their faith in drugs. Conflicting schools arise, but all have a common goal—to relieve human suffering, to prolong life, and to stay the hand of time. How worthy the effort. But how meager the reward."

Exhibit No. 3 was a goat, visualizing what man once considered the fountain of youth and we read the following explanation:

"The sand seeps through the hour glass! A great discovery is announced. To renew the youth, trans-

Left to right: J. W. Martin, C. A. Schroeder, J. Q. Emery, George McKerrow, and H. A. Brace. These men attended the meeting of pioneers in dairying of Wisconsin, held in Milwaukee, Wis., during the week of the National Dairy Exposition. All of them can remember when there was no dairy industry in Wisconsin, and they found pleasure in relating the early dairy practices upon the farm before the invention of modern dairy equipment. Some of these men have been following the footsteps of the cow for more than 60 years.

SEGIS PIETERTJE PROSPECT, THE CHAMPION MILK COW OF THE WORLD WITH FRANK O. LOWDEN, PRESIDENT AMERICAN DAIRY FEDERATION (RIGHT), AND GOVERNOR JOHN J. BLAINE OF WISCONSIN

THREE VETERANS OF THE SHOW RING
Left to right: Jimmie Lee (who has handled entries on the big circuit for 37 years). He has showed Marsh Farm Guernseys for many years. Frank White with 27 years of show ring experience. He is showing Jefferson County Holsteins this year. John Swanigan, veteran Jersey showman whose ring work includes 30 years on the big circuit. He is showing Elm Hill Farm Jerseys this year.

S. F. HELEN R, SENIOR AND GRAND CHAMPION AYRSHIRE COW

OWNED BY ADAM SEITZ & SONS, WISCONSIN

plant the gland. Less painful and more popular the craze to use the extract of these so-called health-giving glands. Precious humbugs all!"

Exhibit No. 4 consisted of paint, powder, and clay, and we read:

"The sun sweeps through his daily cycle. The pot of gold lies just beyond the rainbow's end. A vain god entices. The appearance of youth is sought and obtained by 'covering up' the marks of time. The era of putty paint and powder is ushered in. How futile the effort! Cosmetics can add not one moment to the days of man!"

Exhibit No. 5 was a fountain of delectable milk and here follows the explanation:

"Time runs on; the urge persists. Meanwhile patient, plodding men of science, moved only by the desire to serve the race, search the secrets of life. Hidden away abundantly in the myriad atoms of milk they discover in vitamins the unseen builders of health and strength and beauty and lengthened life. They proclaim to the world the now accepted truth 'Milk is the one indispensable food in the diet'. Come, drink at the fountain of youth!"

Junior Show a Feature

Who will be the dairymen ten—twenty years from now? Of course, they are our boys and girls today. To our mind the Junior Show at the National was of great significance, and we hope that every Dairy Show visitor paid his respects to the boys' and girls' department. There on the ground floor were some 150 sleek looking dairy calves. Just inside the door where the stairways lead up were held the dairy team demonstrations. Many a grown-up could learn a good many things from these young demonstrators, seekers after the truth. Then, going up, on the second floor, the kitchen, the dining hall, the play room, the sleeping quarters, and more beds on the third floor. Over 400 boys and girls from 21 different states were in attendance. And the spirit? Simply great! A more complete report of junior activities will be found on the Junior page of this issue.

Student Judging Contests

There were twenty-four teams from as many states. All day they labored in the show ring and in giving their oral reasons. They did not learn the results of the gruelling battle, however, until the following Tuesday night when they assembled at a banquet to talk it over.

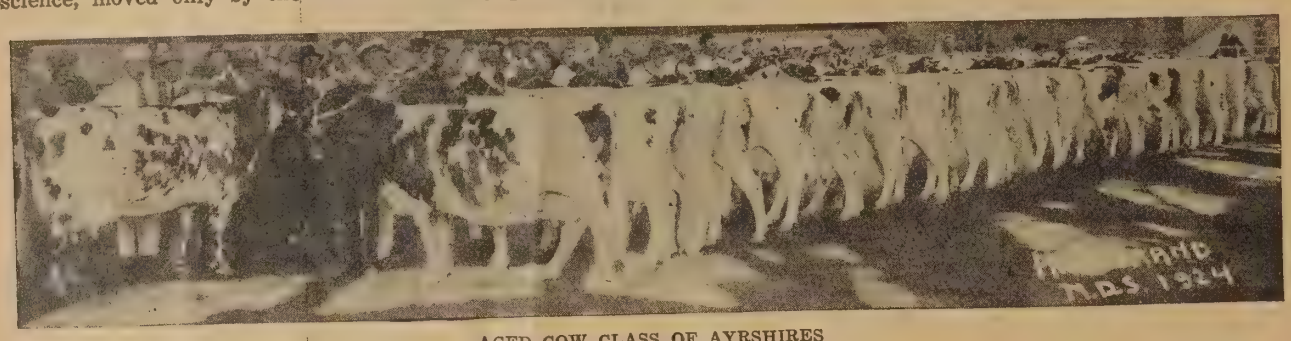
Sunday was a rather quiet day at the National Dairy Show. Monday brought another students' contest. This time the boys fought it out judging dairy products. The awards were made Tuesday night at the banquet.

Michigan Agricultural College captured first place in the dairy cattle judging contest, Wisconsin second, and Nebraska third. The Michigan team was coached by J. E. Burnett. Members of the team were: Ernest S. Weisner, R. Palmer Britsman, and Frank H. Williamson. Williamson was declared champion individual judge.

States represented in the contest were, besides the three winners: Illinois, Iowa, Massachusetts, Missouri, New Hampshire, N. Dakota, Ontario, Oklahoma, Virginia, Texas, South Carolina, New York, Ohio, California, Kansas, West Virginia, Minnesota, South Dakota, Oregon, Indiana, Tennessee.

Iowa State College was first, Pennsylvania State second, University of California third, Ohio fourth, and Oregon fifth in the students' dairy products judging contest. W. W. Greise of Iowa was awarded the honor of being best all around judge. The dairy products' judging contest is rather a new event on the students' program at the National, but this year's contest was a marked success.

Farmers' Judging Contests Success



For many years the students' cattle judging contests have been held, but this year brought a new departure in the way of judging contests and the first farmers' dairy cattle judging contest. During the past summer many sectional contests have been held throughout Wisconsin and the National Dairy Show brought together the winners. More than 30 three-men teams—some had women on, too—competed during the week. George M. Briggs of the Wisconsin College of Agriculture was in charge. This contest is considered of great value to farmer-dairymen in the selection and improvement of their herds. The farmers' contest took place in the grade cattle barn. Twenty-four teams, a total of seventy-two contestants, competed during the week. In addition forty-one individuals participated for high scores. Six different states were represented: South Dakota, Missouri, Illinois, Michigan, Minnesota, and Wisconsin. Never before has the grade cow received so much attention at the big Dairy Show.

Dairy Machinery Exhibits

Down town in Milwaukee's big auditorium were housed the machinery exhibits. It was a veritable labyrinth of modern machinery designed to handle efficiently the manufacturing of dairy products. Hardly more than 35 years ago the wooden dash churn worked by hand was almost the sole instrument used in making butter; milk was cooled by setting in a tank of cold water; the milk bottle unknown; pasteurization was not practiced; milk was largely separated by skimming with a spoon or by other primitive methods; delivery was made afoot or with a horse. But today, see that giant power churn that will churn out butter by the ton; see that great cooling system that will make milk ice cold in a miniature Niagara Falls; there are the tremendous filling and capping machines handling thousands of quarts in a comparatively short while; see the huge pasteurizing plants designed to make milk safe for human consumption; over yonder notice those big electric and gasoline trucks used in modern milk delivery. Truly 'tis a wonderful age—the age of machinery. Exhibits filled Milwaukee's massive auditorium to overflowing. Fifteen years ago the whole National Dairy Show was housed in this same building. What a wonderful change! What a stupendous growth!

The Dairy Cattle

Nine hundred and fifty-four head of pure-bred dairy cattle, the pick of earlier shows, representing seventeen states and two Canadian provinces, made up a National Dairy Show exhibit of just 74 head less than in 1923. Some of the breeds were better represented than a year ago, others not so well, but practically every blue ribbon winner was an outstanding representative of its breed and those who came to see them judged were amply repaid for coming. Unfortunately all too small a crowd was there at any time and during most of the last two days the arena seats were almost deserted.

AGED COW CLASS OF AYRSHIRES

The two-judge system was used for four of the breeds and while satisfactory decisions resulted in most cases, we doubt the efficiency of such a system. Two judges on an equal footing mean too many compromise decisions that really do not represent the opinion of either man. Moreover, it makes for slower placing of the animals which in turn lessens the interest of the spectators.

It has always seemed to us that if a man is a capable judge he can do his best work without having to defer to someone else a part of the time and if he is not a capable judge he has no business in a National Dairy Show ring regardless of who may be there to assist him. Time and again we have seen each of two men do efficient and satisfactory judging alone and then at a later show the two of them working together prove far less satisfactory.

If there must be two judges let one do the placing, calling in the other only when he may want advice on a close decision. Apparently the Jersey judges did that this year. At least Mr. Tucker seemed to do most of the work, and then called Mr. Sisson for consultation after the cattle were pretty well lined up. Their system seemed to work out well. Little time was lost, and both spectators and exhibitors appeared to be well satisfied.

Ayrshires

Judges: Gilbert McMillan, Quebec; J. B. Fitch, Kansas.

Ayrshire breeders who attended the National should have been proud of the excellent showing their breed made this year. We have seen one or two larger exhibits of the red and whites but never have we seen one so uniformly good as that made by the 190 head from 31 herds in four states and two Canadian provinces. It was regrettable that more visitors were not in the judging arena Friday and Saturday to appreciate it.

The judging of Ayrshires was not nearly so satisfactory to those who saw it. It was productive of a number of arguments and two or three near riots in the ring, something to be much regretted because they did no good and looked to us like poor sportsmanship. It is not always easy to smile and say nothing when one loses, especially when the decision seems wrong, but the only protest that is ever allowable is an orderly one. We know that it is not always either wise or just to criticize the placings made by experienced judges who have a much better opportunity to study the animals in the ring than do the spectators, but the Ayrshire judges this year certainly did a far from satisfactory job with some of their classes and we are inclined to place the blame for most of this on the two-judge system which must always mean many compromise decisions.

To us the best class of the entire show, all breeds considered, was the Ayrshire aged cow class with twenty-seven entries. Some of the other breeds had larger classes and certainly had aged cow winners that equalled the winners in this class but among these twenty-seven were surprisingly few tailenders.

Seitz's S. F. Helen R. was an outstanding first although, having just freshened, she did not show the depth of a week earlier at Waterloo. Next to her in the line was Belle of Oban, a dry cow owned by the Experimental Farms of Ontario. She is a good type of cow but showed just a little plain and it almost seemed as though Wallis' Lucindy of Spring Castle 2nd, last year's grand champion, could have gone into the line right there in spite of the fact that her fore udder is no longer well attached. She finished in seventh place. There was another good Seitz entry in fourth place with the third prize

STRATHGLASS ROAMER, JUNIOR AND GRAND CHAMPION AYRSHIRE BULL

OWNED BY BARCLAY FARMS, PENNSYLVANIA

ROBERT SCOVILLE AND H. H. KILDEE, GUERNSEY JUDGES

cow not too good in udder or rear end.

Among the four-year-olds, Cavalier's Luxury, owned by Seitz, and Woronoake Pearl 3rd were outstanding and to the spectators it almost seemed a toss-up as to which would win. The judges put the Wisconsin cow up and had an Ontario heifer third with perhaps their hardest entry to place in fourth. This was a very milky looking heifer owned by Barclay Farms, too good to go farther down below some of the type more nearly like the leaders and too small to go higher.

There were twenty-eight two-year-olds—a very good class with an exceptionally good pair representing Alta Crest Farms and the Ohio State University herd at the top. These two were very close but the Massachusetts entry seemed the stronger heifer of the two and went up, sustaining the judgment made at earlier shows where the two met.

The junior yearlings when finally placed caused one of the big arguments of the show. Barclay Farms' Barclay's White Flower was a very good heifer and quite probably deserved her place at the top, although she does not have too strong a back, but everyone except the judges seemed agreed that Cavalier's Howie's Glen, owned by Seitz and placed seventh, would have made a better second than the rather plain Cummings entry that did finish there. Certainly the Seitz heifer was better than her stablemate that finished third and away better than the two in fourth and fifth places.

S. F. Helen R. was senior and grand champion and Alta Crest Hillbrow, a senior calf owned by Alta Crest Farms, beat the junior and senior yearlings, both of which belonged to Barclay Farms.

One of the big surprises in the bull classes was the placing of Auchenbrain Toreador, grand champion at the Eastern States Show this fall. He was a hard one to fit in the class because he is pretty high off the ground and of a little squarer bodied type than any of the others. He couldn't beat Seitz's Ping Pong that placed first but most every one expected him to come somewhere near the top. The judges put him down to sixth largely because he did not move too well and his hind legs are no longer entirely sound.

The real upset among the bulls, however, was the grand championship decision. Cavalier's Ping Pong was a good senior champion and almost every one expected him to beat the junior champion, Strathglass Roamer, a senior yearling owned by Barclay Farms. The judges put the young bull up. They criticized the old bull's head and neck, found him a little patchy at the tail setting, and gave the youngster credit for better Ayrshire type in spite of the fact that he is not too well sprung and is narrow at the pins.

The Ayrshire breeders deserve credit for bringing out five state herds. They were the only ones to do it although it should have been easier for almost any of the other breeds to have done so. Certainly with the show where it was, Holstein or Guernsey breeders should have been able to accomplish it much easier. The state herds represented Ontario, Quebec, Wisconsin, Massachusetts, and Ohio, and were placed in the order named, a placing that was not entirely popular. The judges found the Canadian groups most uniform, although the Wisconsin herd had the most top or near top prize winners.

Exhibitors:—Ayrcroft Farm (B. B. Simons & Sons), Daniel Hanrahan, Wm. Nesbit & Sons, Adam Seitz & Son, University of Wisconsin, H. M. Wallis, of Wisconsin; Alta Crest Farms, Middlesex Meadows Farm, Monstone Farm, Massachusetts Agricultural College, Woronoake Heights, of Massachusetts; F. O. Betts & Sons, B. G. Betts & Sons, Ohio State University, C. B. Otto Farms, of Ohio; Barclay Farms of Pennsylvania; Melvin Begg, Cummings Bros., Peter S. Cairns, Director Experimental Farms, Scott Fraser, Alex Hume & Co., Kemptville Agricultural School, J. L. Stansell, of Ontario, Canada; Ulric Deschamps, Arthur Legare & Sons, Macdonald College, R. R. Ness & Sons, D. T. Ness, of Quebec, Canada.

J. E. DODGE AND J. C. PENNEY, EMMADINE FARM MANAGER AND OWNER

Guernseys

Judges: Robert Scoville, Connecticut and H. H. Kildee, Iowa.

The Guernsey show outside of one or two classes was not up to the standard one expects to see at the National Dairy Show. Two hundred and forty-one individuals were led before Judges Scoville and Kildee and the closeness of the first two in many cases was very marked. The long looked for meeting of show herds from various parts of the country resulted in both grand championships going to Emmadine Farm, New York; the muchly coveted blue ribbon in the get of sire class to Shorewood Farm, Minnesota; the aged bull class to Hyzer, Wisconsin, and the aged cow class to Marsh, Iowa.

Fourteen aged Guernsey bulls entered the ring at nine o'clock Tuesday morning and started the live stock judging program which was watched by thousands of breeders from all over the country. Lassie Boy of the Prairie, a six-year-old owned by Albert Hyzer, Wisconsin, won first place with Joseph Golinvaux's Memento of Highland Place winning the red ribbon. The winner was cleaner cut behind and was more attractive in front.

Shorewood Resolute, owned by Emmadine Farm, won the three-year-old class in an easy manner. Another Cherub bull, Cherub's Royal Leader, owned by Shorewood Farm, was second choice. Shorewood Resolute was later made senior and grand champion. He is a bull well worthy of the honor and has been awarded the blue and purple ribbons wherever shown this year.

The best male class from the breed standpoint was that of the junior yearling bulls. Eleven fine future sires, fitted well and exhibited to their very best advantage, comprised this class. Marsh's Cherub's Prospect of the Prairie was finally placed at the top and Corium Cherub's Edgar, a Reuping entry, was right at his shoulder. Third went to Dorothy Marie's Challenger of Iowanola owned by Mountain Bros., Iowa. The first and second bulls were reversed at Waterloo the week previous.

Twenty-four aged cows made a very impressive showing with Marsh's Honey Bloom of the Prairie, a show-ring veteran, finally being placed first. Bell Buoy's Golden Lassie of City View, owned by Tenney, won second honors and Moss Raider's Primrose from the Emmadine herd received the white ribbon. The three-year-old class, however, was superior when all animals were considered. Mixter May Princess, a cow of outstanding dairy type, won this class and later the senior and grand championships. Emmadine's Foremost Princess was second to Mixter May Princess in her class and Marsh's Peach Blossom of the Prairie was third. Much deliberation was necessary in awarding the female championships. Mixter May Princess and Honey Bloom of the Prairie are both very good individuals and although the former may be faulted a little behind the shoulders, her pronounced dairy temperament carried her over the older cow.

The Get of Sire class which is without question the most important to breeders, and which rewards the winning owner exactly the same amount as the junior calf class, was a very good one. Hoard's Dairyman originated a movement some time ago to place the proper emphasis on this class and to define its qualifications so that cows and heifers would largely constitute each get. It takes some time for breeders to develop a get of this character, yet we are very confident that a few years will see our various fairs and shows realizing the importance of this class. This year a young get of Ladysmith's Cherub was given the preference over a group of four females by

SHOREWOOD RESOLUTE, SENIOR AND GRAND CHAMPION GUERNSEY BULL
OWNED BY EMMADINE FARM, NEW YORK

Cherub's Prince, all of which had passed through one or more lactation periods. The judges faulted the second prize winners which were owned by Marsh because of their prominent tail settings and gave the blue ribbon to the Tenney group on their superior uniformity and top lines. We were not entirely in accord with this decision and hope that next year and henceforth females that are truly demonstrating the value of their sire as well as his real purpose in life will be given more consideration. A young get of Langwater Foremost, exhibited by Emmadine Farm, received third money and Mountain Bros. won fourth and fifth on gets of Cherub's Winner and Cherub's Challenger.

Guernsey awards on page 407.

Jerseys

Judges: C. J. Tucker, Missouri; Geo. W. Sisson, New York.

The Jersey show was by no means as good as it usually is. One hundred thirty-one head made it a smaller show than that of three of the other breeds. The quality was good, however, for many of the winners at earlier fairs were there.

Twin Oaks Farm of New Jersey was the big winner, taking 11 of the 19 blue ribbons as well as both grand championships. Fern's Wexford Noble, their aged entry, easily headed the bulls, something he has done wherever shown for the past three years. He is the kind of bull all of us like to talk about but seldom see—an upstanding, stretchy fellow with plenty of scale and very smoothly turned. Next to him in the aged class was Sayda Rose's Jap, owned by Jersey Crest Farms, Wisconsin, of much the same general type but lacking some of the winner's finish and not so smooth at several places. The aged bull was, of course, senior and grand champion.

Counterstroke owned by Twin Oaks and Xenia's Cowslip Oxford, Elm Hill Farm's junior yearling, were the chief competitors for junior championship. The former is good but he showed poor over the top much of the time while in the ring and is perhaps not quite so good over the rump so that the younger bull was a popular winner.

The fifteen aged cows made an excellent class and if a few of the tail-enders could have been eliminated it would have been second in quality to none during the entire week. Fern's Oxford Diana was a very acceptable top, indeed, with Imp. Juggler's Jersey Queen owned by Ellsworth second and Fern's Interest Lass, also from the Twin Oaks herd, third.

Elm Hill Farm brought out the outstanding four-year-old, Xenia's Surprise, and she was later one of the chief contenders for senior championship honors. She is equal to the aged cow in many respects and has perhaps a little more style, but her udder is cut up more underneath and it was largely because of this that Fern's Oxford Diana was senior and grand champion.

FIRST PRIZE JERSEY GET OF SIRE

The junior female classes were not so well filled in proportion to the size of the show as were those of the other breeds, due, no doubt, largely to the fact that these animals must be bred by exhibitor. Sybil's Pomona, an outstanding senior yearling daughter of Sybil's Gamboge, was an easy winner in her class and a good junior champion. She is owned by J. S. Ellsworth, Connecticut.

Exhibitors—Dorothy Ausman, S. A. B. Ausman, W. O. Douglas, Chas. A. Dunbar, John Hill, E. E. Hill & Sons, Jersey Crest Farms, W. M. Knight, Mrs. Philip Smith, Hugo J. Trost, University of Wisconsin, Frederick D. Underwood, of Wisconsin; Jas Bagg & Sons, B. H. Bull & Son, Harry Cockshutt, Frank Chapman, D. Duncan & Son, J. M. Dolson, A. T. Little, John Pringle, of Ontario, Canada; Cedar Crest Farms, of Illinois; C. C. Chamberlain, J. S. Ellsworth, Louis Stanton, of Connecticut; Sam F. Crabbe of North Dakota; Mrs. J. L. Dodge of Kentucky; Thelma Dye, Foy Mendenhall, Indiana Condensed Milk Co. and E. A. Richardson, of Indiana; Elm Hill Farm of Massachusetts; Inderkill Farm of New York; Meredith Jersey Farm of Iowa; Pebble Hill Plantation of Georgia; South Dakota State College; Twin Oaks Farm of New Jersey.

Jersey awards on page 422.

Brown Swiss

Judge: Professor Geo. Humphrey, Wisconsin.

While the Brown Swiss exhibit was not up to the record showing at Waterloo a week earlier, it was a good one representing eleven herds from six midwest states.

Marshall of Michigan had winning entries in three of the six bull classes and with two of his three winners succeeded in taking both junior and senior championship. His three-year-old, Prince of Meadow Green, was a good winner among the seniors and his senior calf was junior champion. The latter is cleaner cut in the thighs, has a better head, and shows we think just a little more dairy type but Professor Humphrey favored the more mature animal, thereby reversing the Waterloo placing where the younger bull was grand champion.

PRINCE OF MEADOW GREEN, SENIOR AND GRAND CHAMPION BROWN SWISS BULL
OWNED BY L. S. MARSHALL & SON, MICHIGAN

Swiss Valley Girl 7th, Hull Bros.' great 15-year-old cow, was an easy first among 15 aged cows and in the line just below were two others from the same herd and by the same sire, Reuben, placing third and fourth. Betty of Lake View, owned by A. E. Bower & Son, herself a grand champion at many shows, was second. She, too, is by Reuben, and completed a get of sire line up in an aged cow class that we have never seen equaled anywhere.

Hull Bros. succeeded in winning two other female classes with their junior yearling and heifer calf but Nick Schmid's senior yearling stopped them when it came to junior championship.

The old cow was senior and grand champion.

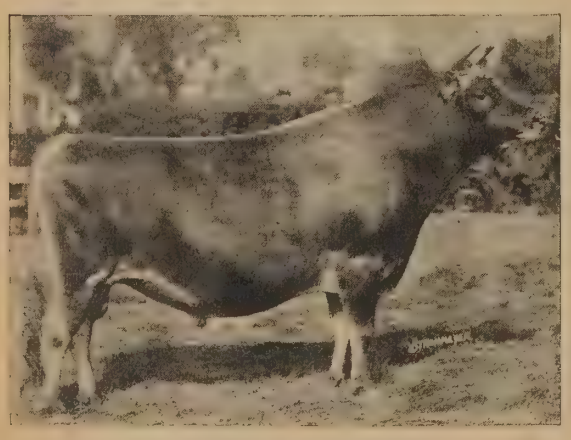
Exhibitors—A. E. Bower & Son of Illinois; James Dodge, W. A. Drollinger, Emil J. Jensen, N. C. Schmid, Lila Schmid, Elmer Tubbs, of Wisconsin; Hull Bros. Co. of Ohio; J. W. Hess of Indiana; L. S. Marshall & Son of Michigan; F. P. Minette & Son, Minnesota.

Brown Swiss awards on page 407.

Holsteins

Judges: W. S. Moscrip, Minnesota; T. E. Elder, Massachusetts.

The Holstein show was very much of a success. There were 285 head shown from 93 different herds and while previous shows may have brought out individuals that would have beaten some of the tops this year, the breeders have every reason to be pleased with the 1924 line-up.



The 38 aged cows were the largest class of the show and although they failed to show the quality of a younger class, they were good. Zwingara Segis Clothilde, owned by the Modern Woodmen Sanatorium, and undefeated in class this year, made a very acceptable top with Bessie Fayne Johanna, owned by Waters & Buth, Michigan, a good second. The latter has the advantage of size and the best veining we have seen in years, but she lacked finish. Below these two the quality was not quite so good and we are inclined to think that some of those down toward the end of the ribbons were little, if any, better than a few of those which got the gate. In fact one cow, sent to the barn, placed above two of the lower money winners in the A. R. O. class next day.

FIRST PRIZE BROWN SWISS GET OF SIRE BY REUBEN

The cow at the extreme right is 15 years old and was grand champion. The cow next to her won second, the next third, and the last one fourth.

JUDGES MOSCRIP AND ELDER OF THE HOLSTEIN CLASSES

show was in the three-year-olds with the top five as good as any five three-year-olds we have ever seen in a ring. Judge Moscrip pronounced them by far the best he had seen this year. They included Madam Artis Wayne Denver, the Jefferson County (Wis.) heifer; Dorothy Ormsby Piebe, owned by Hargrove & Arnold; Maudlene Ollie Homestead entered by the Minnesota Holstein Co.; Jessie Hengerveld Segis from the Detroit Creamery Co. herd, and Corwin Colantha Florence Ormsby owned by B. S. & S. H. Dragoo of Indiana. The last named was first last year as a two-year-old but she was very much out of condition and while an excellent heifer could not have beat any of the other four. Madam and Dorothy were unquestionably the two best of the class but the two others were close and of nearer the same type as the Jefferson County entry so that many thought the Hargrove heifer would either go above or below the three. Madam, with much the advantage in scale and udder, went first with the others placing in the order named.

Last week at Waterloo the Zwingara cow beat the three-year-old for senior championship but Moscrip and Elder reversed that decision, putting the heifer up because of her better head, depth of body, quality of udder, and set of hips and pins as well as her size (she weighs over 1,700 lbs.). She is heavy at the shoulders, lacks in her veining, and is just a little patchy over the rump, but this fleshiness could be discounted in part because she is showing dry. The Colorado cow is a good little cow but hardly as good a Holstein cow as Madam is a heifer.

The grand championship went with the senior, and junior championship to Johanna Wayne Rue 2nd, a very good senior yearling sister from the same herd.

In the bull classes the final decision among the seniors was pretty much a foregone conclusion. North Star Joe Homestead, owned by Hoesly of Wisconsin, has headed the aged class at several of the larger fairs this fall with Johanna Rag Apple Pabst, owned by J. E. Piek, doing the same for the three-year-olds. They did the same this time and made an interesting part of the senior championship competition. The three-year-old carries an exceptional depth of body and a better top and shoulder than the older entry but the latter is better at the head and does not carry quite as much flesh. A decision either way would have made few enemies. The judges put the three-year-old up, thereby keeping his record clear for two seasons. He was also grand champion and Sir Inka May, a junior yearling son of May Walker Ollie Homestead, Minnesota's great record cow, was junior champion.

MADAM ARTIS WAYNE DENVER, SENIOR AND GRAND CHAMPION HOLSTEIN COW
OWNED BY JEFFERSON COUNTY ASYLUM, WISCONSIN

The awards follow:

Bull, 4 yrs. or over—1, Hoesly on North Star Joe Homestead; 2, Coon—Craig—Post—Jones on Walcowis Ollie Hijlaard; 3, South Dakota State College on Sir Aaggie Colantha Korndyke; 4, Garven on Parthenea Sir Beets; 5, G. Keys on Sir Johanna Pauline Ormsby. Bull, 3 yrs. and under 4—1, J. E. Piek on Johanna Rag Apple Pabst; 2, Hargrove & Arnold on King Pietertje Ormsby Piebe Jewel; 3, Modern Woodmen San. on Corwin Wimple De Kol Ormsby; 4, Lakefield Farms on Count Veeman Segis Piebe; 5, Agr'l School Farm on North Star Belle Oak Champion. Bull 2 yrs. and under 3—1, Iowana Farms on Tritomia Pietertje Ormsby Lad; 2, Wiffenbach & Son on King Pontiac Champion Parthenea; 3, G. Rice on Sir Tritomia Mercedes; 4, Carnation Milk Farms on Sandy Segis Walker Matador; 5, Katzman on Sir Ollie Lilith Ormsby. Bull, 18 mos., under 2 yrs.—1, Hargrove & Arnold on Triune Ormsby Piebe 27th; 2, Heck Bros. on Sir De Kol Ollie; 3, Carnation on Harvest Jewel Matador; 4, Modern Woodmen San. on Woodcraft Pontiac Champion Star; 5, J. Piper on Prince Creamelle Acme Vale. Bull 1 yr. and under 18 mos. old—1, Minn. Holstein Co. on Sir Inka May; 2, Jefferson Co. Asylum on King Mutual Fan; 3, Hargrove & Arnold on King Piebe 19th; 4, D. Peterson on Iowana Fayne Burke; 5, Carnation on King Burton Quoque. Bull calf, 4 mos. and under 1 yr.—1, C. Holle on General Homestead Mercedes; 2 and 3, Hargrove & Arnold on King Piebe 28th and King Pietertje Ormsby Piebe 50th; 4, Christ & Hackbarth on King Richmond Pontiac; 5, Heck Bros. on Ollie De Kol Ormsby.

Cow, 5 yrs. old or over—1, Modern Woodmen San. on Zwingara Segis Clothilde; 2, Waters & Buth on Bessie Fayne Johanna; 3, Iowana Farms on Lady Johanna Aaggie Fayne; 4, Agr'l School Farm on Barbetta Hengerveld De Kol; 5, Minn. Holstein Co. on Far Oaks Inka Homestead. Cow, 4 yrs. old and under 5—1, H. E. Dickenson on Dolly De Kol Tirania Fayne; 2, H. Klemme on Julia De Kol Pietertje Ada; 3, Vander Schaaf on Queen Johanna of Enterprise; 4, Jefferson Co. Asylum on Charity Canary Denver; 5, Carnation on Carnation Matador Addie Segis. Cow, 3 yrs. and under 4—1, Jefferson Co. Asylum on Madam Artis Wayne Denver; 2, Hargrove & Arnold on Dorothy Ormsby Piebe; 3, Minn. Holstein Co. on Maudlene Ollie Homestead; 4, Detroit Cry. Co. on Jessie Hengerveld Segis; 5, B. S. & S. H. Dragoo on Corwin Colantha Florence Ormsby. Heifer, 2 yrs. and under 3—1, 2, 3, Minn. Holstein Co. on May Pietertje Homestead Ormsby, Star Segis Homestead, and Miss Mechthilde Segis; 4, So. Dakota State College on Happy Home Daisy Johanna; 5, Carnation on Carnation Matador Mercedes Selah. Heifer, 18 mos. old and under 2 yrs.—1, Jefferson Co. Asylum on Johanna Wayne Rue 2nd; 2, Carnation on Carnation Pauline Matador; 3, Hargrove & Arnold on Pietertje Ormsby Piebe Mercedes; 4, Minn. Holstein Co. on Star Homestead Segis; 5, Jefferson Co. Asylum on Mutual Calamo Clothilde 2d. Heifer not in milk, 1 yr. old and under 18 mos.—1, Hargrove & Arnold on Miss De Kol Piebe; 2 and 5, Keys on Cosy Burke Ormsby and Miss Pietertje Ormsby Segis; 3, Iowana Farms on Iowana Homestead Segis; 4, Lakefield Farms on Lakefield Count Veeman Piebe. Heifer calf, 4 mos. old and under 1 yr.—1 and 2, Hargrove & Arnold on Triune Piebe Fobes and Neola Piebe Annie; 3 and 5, Carnation on Carnation Matador Lulu Walker and Carnation Matador Lulu Segis; 4, Uni. of Nebraska on Ormsby La Vie of Uni. of Nebr.

Cow under 4 yrs., having official yearly record—1, Jefferson Co. Asylum on Madam Artis Wayne Denver; 2, Minn. Hol. Co. on Maudlene Ollie Homestead; 3, Detroit Cry. Co. on Jessie Hengerveld Segis; 4, Iowana Farms on Iowana Ona Homestead De Cola. Cow 4 years old or over, having official yearly record—1, Waters & Buth on Bessie Fayne Johanna; 2, Iowana Farms on Lady Johanna Aaggie Fayne; 3, Minn. Holstein Co. on Far Oaks Inka Homestead; 4, Waters on Maryland Walker Colantha; 5, Uni. of Neb. No. Platte Substation on Clothilde Topsy King. A. R. cow with two of her progeny—1, Minn. Holstein Co. on May Walker Ollie Homestead; 2, Hargrove & Arnold on Miss Piebe Fobes; 3, Carnation on Tillamook Lola May De Kol; 4, Iowana Farms on Iowana De Cola Ollie.

Underweight Girl Gains

Bernadette Keller, home demonstration agent of Vanderburg County, Ind., has been instrumental in establishing hot school lunches in several schools in that county. The Parent Teachers' Association purchased scales and children in the higher grades of high school were taught to do the weighing. Diet books were furnished the underweight children and special meetings held with these children and their mothers.

Perhaps the most outstanding child was one 12 years old who was 17 pounds underweight. She was listless and had a colorless complexion. Through the nutrition work she learned food values and the selection of her food was materially improved and the quantity increased. Milk was used instead of coffee and in four months this child had gained ten pounds and had improved mentally.

Fifteen counties are carrying on the county wide nutrition project given by the home economics extension makers of the Purdue University, and many children are being greatly benefited by the milk and hot school lunch which can be served in even one-room school buildings with limited equipment.—Purdue Experiment Station.

Every year I live I am more convinced that the waste of life lies in the love we have not given, the powers we have not used, the selfish prudence that will risk nothing, and which, shirking pain, misses happiness as well.—NAPOLEON HILL.

EDITORIAL COMMENT

A WESTERN farmer, some 30 years ago, visiting in Massachusetts, called upon a farmer and found him cutting a field of hay with a scythe. This method of making hay looked insignificant to this farmer from the Mississippi Valley, as well as slow and tedious. In the course of his remarks he said, "Out West we leave more hay in the fence corners than you will gather from this whole field." The Massachusetts farmer reflected for a moment and then replied, "Perhaps if you would gather the hay in your fence corners, you'd be able to pay the mortgages you owe us in Massachusetts."

There was a heap of meaning in the reply of the Massachusetts farmer. It has been our observation that the farmers who seem to make progress, who build good homes, and free their farms from mortgages, are the ones who find no job too small for them to do. They save everything the farm produces and apply themselves quite as much to little things as to the big ones. Many times the only profit obtained comes by saving the small crops which are many times wasted on the big farms. Let us not despise doing the small things, no matter in what industry we may be engaged.

CLOVER FAILURES

It is quite noticeable in many sections of the country that clover does not do as well as it did in early years. Earl Jones, extension soil specialist of the Ohio College of Agriculture, made a careful inspection of 80 hay fields in Northeastern Ohio and found only five with a good stand of clover. It was plain something was wrong with the soil. A great many soils that do not produce good clover are improved by an application of ground limestone, marl, or some other form of lime, and an application of phosphatic fertilizer and barnyard manure.

It is important also that the soils be well drained and that they be supplied with plenty of organic matter. That is, roots of plants, barnyard manure, green crops plowed under, etc. Sowing fields to clover and then securing only poor stands is a great waste. It is far better to devote five acres to the growing of clover or alfalfa on land properly prepared than to try to grow four times this amount on soils that are unsuitable or improperly prepared.

LEGAL BUTTER

The Internal Revenue Department has issued a new ruling pertaining to adulterated butter. It was forced to make some change in its ruling, for the Supreme Court has decided that butter containing 16% of moisture is not necessarily adulterated. The Internal Revenue Department has decided that in the future the test that will be applied in determining if butter is adulterated is not whether it contains 16% of moisture, but whether any process or material has been used with the intent or effect of causing absorption of abnormal quantities of water, milk, or cream. One who knows how butter is made will fully appreciate how busy the Department will be determining whether artificial means were used for increasing the moisture content of butter.

It seems to us the Internal Revenue Department has lost sight of the real purpose of the Adulterated Butter Act. It is clear that when foreign fats or foreign materials of any kind are added to butter it is adulterated. Moisture is a natural ingredient of butter. It varies from 12 to 16 or even more per cent. Why worry about moisture when Congress has enacted a law requiring legal butter to contain not less than 80% fat? The law is so written that if butter would contain 79.9% fat it is adulterated and subject to a tax.

For nearly twenty years some department of the federal government has been trying to determine what constitutes illegal and adulterated butter. We have grown impatient with their fiddling and fooling around. Thousands of dollars of the tax payers' money has been spent to determine the difference between tweedle-dee and tweedle-dum. It is to the advantage of the dairy interests that an honest butter product be put on the market, and it is generally held among all men who know butter that if it contains 80% fat the consumer is receiving an honest product. Then why should the Internal Revenue Department ignore the fat content of butter? Why don't its officials recognize it and use it for the enforcement of their ruling?

BETTER CHEESE IN WINTER

It was once thought that good cheese could not be made in winter. At the time of this conclusion, there was some good basis for it. Cows were not fed good rations in the early days. Most of them received just enough feed to carry them through the winter and very often they were thin and in poor condition in the spring. At that time most of the cows calved in the spring and they were well along in their period of lactation in the winter. These conditions did not provide for the production of good milk and the cheese made from it did not have the quality equal to that made during the months when cows were fresh and receiving grass as their rations.

It is different now. The great majority of cows in dairy sections receive fairly good rations. We still have men who are poor feeders, but the poorest feeders now are close if not equal to the best in the early days. A higher percentage of good cheese is made now when cows are stable fed, according to a report of the Market News of the Wisconsin Department of Markets. This may be explained by the fact that many cows now freshen in the fall instead of the spring; are fed good rations; and the milk is properly handled. The producer has better control of the quality of milk in winter than in summer. This season has been cold and wet in many of the sections devoted to extensive dairying. The milk flow has been good but the quality of cheese produced is not equal to that of drier years. We see no reason why the quality of cheese produced this winter should not be as good as produced in any winter.

LET'S GROW MORE TREES

The prices of farm products during and immediatly following the war stimulated production. Poor lands were brought under cultivation and the price of good land materially advanced. These two things were the chief causes of the agricultural trouble through which we have just passed. The facts are, too much poor land has been under cultivation and it has yielded little or no profit to those who have tilled it. It has produced a sufficient quantity of farm products to depress prices.

The desire for land stimulates land prices and raises them too high, if their income is compared to the income of other industries. In other words, the desire for land does not make it possible for the farmer to earn the same rate of interest on his investments as is enjoyed by other occupations. We cannot hope to curtail the desire for land and we do not know as it would be wise if we could. The desire to own land is fundamental to national stability. We can and should discourage and perhaps stop the settlement of land which is poor and unproductive. Too many states through their immigration and land service departments have and are encouraging settlers to occupy lands which should be devoted to forestry. It would be well for this nation if millions of acres of land could be withdrawn from crop raising and devoted to the growing of trees. Much land that is occupied at present is only profitable when agriculture is booming, when prices reach the levels they did in 1919. It is a pity that as a nation we have been so careless in our methods of settling land and have commercialized in too many instances the most natural and wholesome desire in all the world; namely, that of owning a piece of land. It is a crime to encourage men with their little families to settle upon much of the poor land that is now occupied or has been occupied.

In the past few years thousands of farms have been vacated. The lessons learned have been valuable, but have been extremely costly and severe and many of them were unnecessary if the state and federal authorities had encouraged the settlement of no lands except those which are productive. Our land policy, our methods of settling lands, can well be criticized, for it is our opinion that if a wiser and better thought out plan had been instituted, there would not be the wide fluctuation in farm prices and there would not be the occasion for agricultural depressions. Low prices of farm products force farmers to vacate these poor lands, but this tragedy might have been avoided if our land policy had been well organized; then it would not have been necessary for inexperienced people to pay the penalties that have been paid by trying to operate unproductive soils.

THE NATIONAL DAIRY EXPOSITION

The National Dairy Classic is a great educational institution; it is a post-graduate course for students, dairy scientists, dairy leaders, breeders, and dairy farmers. It has become a stupendous institution, requiring days to absorb its lessons. It sets forth the magnitude, development, and importance of the dairy industry in pictures, demonstrations, and exhibits which give to its visitors an opportunity to comprehend the meaning of the dairy cow to the people of this nation. It has become so large that the little man, the man of small knowledge and understanding cannot comprehend it.

It is so big that no building in the United States is capable of housing all its exhibits, demonstrations, and activities. This is extremely unfortunate and presents to its management a problem difficult of solution.

The National Dairy Exposition needs to be housed under one roof. The exhibit of dairy machinery at one place, the farm machinery at another, educational exhibits and demonstrations at still another, and the cattle several blocks from all other exhibits, does not make a proper setting for a National Dairy Show. The ideal arrangement would be to have the visitors pass through the various exhibits before they reached the cattle. We do not mean to have but one room for all the activities, but each department should be closely connected. We observed this year many people went straight to the cattle arena, but failed to visit any other department of the show. They missed many of its lessons. This is not good for them or for the industry. We cannot expect everyone to be equally interested in all phases of the exposition, but we would expect every visitor to see all departments and to get a general conception of the lessons they teach.

The dairy machinery exhibitors were well satisfied with their quarters and their results, but they were too far from the cattle, the educational features, and demonstrations of the Show. These men may feel that they have nothing to gain by being closely associated with the cow, but we caution them about being indifferent to their relationship to the creature which is responsible for their industry.

The Dairy Show Association has reached a rather critical period in its history, due to its magnitude and great number of varying interests. It should never be forgotten that the cow is the foundation and for any branch to stray far from her is likely to meet with disappointments and, perhaps, with failure.

What is needed is a permanent home for the National Dairy Exposition where all its forces and activities can be brought closely together and where its many lessons can be taught so that its visitors, no matter what may be their interests, will get a comprehensive understanding of the entire dairy industry.

Sealing Silo Doors

HOARD'S DAIRYMAN:—Here is something too good to keep. For years I have been trying different things and ways for sealing silo doors, from felt strips and building paper to clay. This time we used shorts made into a paste with water, then added enough linseed oil to make it work well with a shingle paddle. We spread this on the door frames, placed the doors, scraped off what mashed out, and we had an air tight door. It fills any crack or warp in staves to perfection, never gets dry while using, and is cheap. If any drops into silage, it will be eaten, so there is no waste.

Argonia, Kansas H. G.

Molasses Improves Unpalatable Feeds

In feeding the first cutting of alfalfa to dairy cows there are always lots of the stems they will not clean up. Would it be practical to put molasses on these? If so, about how much per cow? Most of our cows are large Holsteins.

Larned, Kans. M. B. T.

Unless you have a shortage of alfalfa hay, we would not advise methods which would encourage the cows to eat the coarser parts. By adding a little molasses to the alfalfa it would cause them to eat a larger portion of it. A pound or two a day of molasses may be fed to cows with good results. They like it and it seems to stimulate the appetite and it does improve unpalatable feeds. It is an open question, however, whether it is profitable to get the cow to eat so much coarse feed, especially if there is an abundance of alfalfa. It is the practice on Hoard's Dairyman Farm to feed this coarser hay to the mules and horses, for we feel the dairy cows will do better work if not forced to eat too much coarse material.

Some farmers grind the coarse alfalfa and mix a little molasses with it. This we consider a good practice and one that can be recommended if a person has the machinery for grinding. In the busy season it would hardly pay to grind hay, but in the winter, with lots of time, we believe it is a practice which can be profitably followed, especially if the hay is coarse.

Seeding Sweet Clover in the Fall

Would appreciate your giving us suggestions as to what you consider to be the best method in seeding an old pasture to sweet clover. Do you advise plowing or harrowing, or do you find it sufficient to merely seed on the grass without any further preparation of the ground? Do you advise seeding in the fall and do you recommend the scarified or unscarified seed for this particular purpose?

Jefferson, Wis. W. C. P.

If an old pasture is to be seeded to sweet clover, and particularly if it is on a piece of land that is not especially well suited to farming purposes so that it is not desirable to have it plowed, I would advise the use of the disk harrow on it this fall and then go on and seed unscarified sweet clover seed at the rate of 12 to 15 lbs. to the acre. In seeding the unscarified seed I should want to have a germination test on it and know the percentage of hard seeds. Some unscarified seed contains a large amount of seed that will grow immediately, that is, it is not hard seed.

The only advantage of seeding the unscarified seed in the fall is that the work can be done away from the pressure of spring work and, furthermore, it will give the seed the full advantage of early seeding the following spring. The freezing and thawing of early spring will usually soften the seed that lies near the surface sufficiently so that it will germinate. Where spring seeding is practiced the scarified seed should be used.

I should prefer to use the white blossom sweet clover for pasture purposes because of its longer season of growth and greater yielding capacity.

H. L. WALSTER.

North Dakota College of Agriculture.

Keeping Up Solids in Milk

What is the best kind of feed to give cows to keep them up in solids? Our cows vary in solids. The worst time seems to be from March 10 to grass; this summer when the grass is so wet and then other summers when the pasture was dry.

Morrison, Ill. G. D. H.

To feed cows on a good balanced ration and in quantities sufficient to supply them with all the nutrients they need for milk production and sustaining their bodies is the best and the only way we know of to keep up the solids in milk. Each cow produces a milk which is normal to her characteristics; that is, there is no system of feeding which will materially increase or decrease the total solids of milk. As intimated, when the cows are turned on pasture and the grass is very succulent and not very nourishing, there will be a decrease in the solids of milk. This change, however, is not permanent.

The way to avoid variations in the composition of milk is to feed the cow regularly and to make no violent changes in the system of feeding. For instance, when cows are turned on pasture in the spring, it is well to feed them grain, hay, and silage in the morning and continue to feed what may be termed the "barn ration" until the cows begin to get a sufficient supply of grass to sustain their needs. Again, when the pastures begin to grow short, they should be supplemented with silage, hay, and perhaps grain. When this is done, there will be no violent changes in the composition of milk and the total solids will be in keeping with the characteristics of the cow. You should bear in mind that violent changes in the feeds cause a fluctuation in the total solids of milk.

Tramping Silage a Waste of Energy

HOARD'S DAIRYMAN:—Two years ago I heard of several farmers who filled their silos without tramping and they reported practically no air pockets to cause moldy silage and better distribution of ensilage than the average bunch of 2 or 3 men will do with a distributor. I tried this plan last year and since then have talked with several that have followed it for several seasons with good results. To a few I have suggested this plan, but they argued that the leaves would all blow to one side and that they would not get as much in a silo.

We put on two lengths of distributor pipe and tie so ensilage forms a cone in center of silo. This cone will be about 6 feet high in a 14-foot silo and the leaves and corn will roll to the sides about like so much grain.

In finishing a silo we put in one man to level off the corn when it gets to top of silo. Silos filled this way settle very little more than when tramped. We finished filling a 14x40 silo Sept. 19, putting in 135 loads in comparison to putting in 120 loads in a 14x33 that was well tramped and refilled. I suppose there are 20 silos within a few miles of me that have been filled this way and there will be a lot more this year. If we can save two to three men every day a cutter is running and get as good results, we are saving that much expense.

Madison, Wisconsin. R. G.

This practice of filling has been advocated for some time by certain people and has been vigorously opposed by others. We confess to faith in tramping. What has been the experience of others who have tried the methods described above? Is it as satisfactory as tramping?

Trouble in Churning

We have a herd of Jersey cattle and have been making butter for the last three years. Our butter is a quality product and consequently sells at a premium.

Until June, 1924, we experienced no trouble in churning. Since then it has often taken as long as three or four hours to churn. (Before 20 to 30 minutes.) What is causing the trouble? We skim cream as before to about 35%. After the cream has ripened it is put into the ice box until churning. We churn twice a week. If we warm cream before churning, the butter is too soft to print and also of a poorer quality. We have tried sterilizing all containers and churn, but without results.

Our cows are on sweet clover pasture and in addition are fed a grain mixture of crushed corn, bran, and oil meal according to production. They have salt at all times. The trouble in churning seems to be due to the fact that the cream will not thicken.

Mascoutah, Ill. R. G. E.

Years ago before the introduction of the little hand separator when cream used to be skimmed under the gravity method, many complaints used to come to the Dairy Department of the Iowa State College, when I was in charge of the same, on trouble that certain dairymen had in churning. In most of these cases, the trouble was due at that time in skimming too much milk with the cream or having too thin cream. Thus, the milk would act as a cushion preventing the fat globules from uniting but with the introduction of the centrifugal separator very few complaints were received concerning the churning of butter.

As the gentleman in question states they have cream testing about 35%, the question of excessive milk or serum in connection with the fat would have no effect in that particular case. There is nothing in the feed that would in any way affect the churnability of the cream.

He states 60% of the cows are old milkers or cows that are well advanced in the period of lactation. I think this is partly responsible for the trouble he is having in churning. As the cows advance in the period of lactation, the fat globules become smaller and the cream becomes more viscous. Hence, churning is not brought about as readily as where cream is separated from the milk of cows not too far advanced in the period of lactation.

I would suggest that he take some milk from the fresh cows and separate the cream from the same and let the skimmilk sour and add five or ten per cent of this sour skimmilk to his fresh cream. This starter will, of course, ripen the cream and put it in a condition where it will churn more easily. Also, do not fill the churn more than half full. Churning is brought about by concussion or force. Where there is not too much cream placed in the churn, the drop is greater and you increase the concussion which causes churning to be brought about more quickly.

Illinois. G. L. MCKAY.

Drying and Storing Seed Corn

Because of the many inquiries coming to Hoard's Dairyman at this time concerning the seed corn supply for the 1925 corn crop, a few definite factors to be considered in handling seed corn are important.

Experience has taught that the best seed corn is that which has been allowed to ripen naturally in the field, then selected and further dried and finally stored in a dry place. The condition of the maturity of the corn crop, especially in the upper corn belt section this season, makes it necessary for every farmer to give some special attention to drying and storing seed corn if the 1925 supply is to be of satisfactory quality.

There are three definite and important steps to be observed and practiced if good seed corn is to be guaranteed. These are: first, getting the best seed corn out of the field before heavy frosts occur; second, protecting the seed from freezing and thoroughly drying it; third, storing the seed in a dry place after it is thoroughly dry.

The time of getting the best seed corn out of the field before heavy frosts occur varies from year to year according to maturity conditions and temperature changes. Corn selected in the beginning dent and hard dough stages will make good seed if properly cared for. It is better if weather conditions permit of a more advanced maturity. This is not always possible, as is the case this year. Making the best of what one has to work with applies in the seed corn situation.

The second factor, that of protecting the seed after it comes from the field and thoroughly drying it, is now a very important piece of work for farmers to take care of. Seed corn should be dried fairly rapidly to retard and prevent mold and to get the corn dry enough to withstand damage by freezing. Most seed corn as it came from the field this fall contained more than 30 per cent moisture. Before this corn is safe from the effects of the hard winter freeze the moisture must be reduced to 12 per cent or less. There is no best way to dry seed corn. The really important thing is to get it dry. Some farmers may be equipped to help the drying process by using artificial heat and even in some cases forced ventilation. The majority of farmers, however, depend on natural ventilation for drying corn. The danger point here is that seed corn will be subjected to heavy freezing before it is thoroughly dry. Protect while drying is going to be a good business practice this fall.

The thorough drying of seed corn before storage for the winter makes the selection of a good storage place a little less difficult, although by no means does it lessen the importance of good storage.

In a series of tests made by Mr. Norgord in 1909-10, published in Wisconsin Circular No. 58, some very definite results were obtained when comparing drying and storage methods. From tests made on 16 kiln dried samples, 8 furnace room samples, 112 room above kitchen samples, and 75 attic samples, 211 in all, an average germination of 88.3 per cent and stand of 83 per cent was secured. As compared with this, 139 samples that had been stored under porches, in granaries, barns, tool houses, corn cribs, in shock during winter, windmills, and outside walls of buildings gave an average of 51 per cent germination and 57.5 per cent stand.

Drying and storing seed corn is important right now.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, OCT. 8—The address of Hon. Herbert Hoover, Secretary of Commerce, to the American Dairy Federation at the National Dairy Exposition, has attracted wide attention among dairy producers, as well as in the trade lines of the industry, as evidenced by demands made here for copies of the speech in full.

At the dairy and farm organization offices here, the Hoover address at Milwaukee is taken as an indication of a sincere desire on the part of the Department of Commerce and perhaps even reflecting the spirit of the whole administration, to extend help to co-operative marketing organizations. The vehicle which has been chosen by Mr. Hoover, and which was accurately described in his address, is the Capper—Williams bill, now pending in both the House and Senate, ready for action when Congress resumes work.

The Capper—Williams bill has a long and interesting history, too long to tell here. The author of the framework of the bill is Congressman Williams of Michigan. To this framework a number of additions have been made since it was first introduced. One of them—the most interesting—is that part which calls for the organization of distributor co-operatives, the terminal marketing group of which Secrteary Hoover spoke at Milwaukee. Then the bill provides that these distributors and the producers unite in the selection of men to take positions on the governmental Board of Control, which the bill sets up. After this board is organized the operations of all co-operatives come under its jurisdiction, instead of as at present, when under the terms of the Capper—Volstead act all co-operatives are under the direct jurisdiction of the Secretary of Agriculture, unless they are found to be acting in violation of law, when their cases would be referred to the Department of Justice.

Another bill introduced last session is the Curtis—Aswell bill, known as the Yokum bill. Secretary Hoover, by implication, opposes this measure. Several others were introduced, including one at the very end of the session by Congressman Tincher of Kansas, which is a modest, moderate bill, leaving all co-operatives definitely under the Secretary of Agriculture, but providing a voluntary system of registration and inspection and reports.

Congress will undoubtedly take the whole grist of these bills up for hearings and action early in the session.

Charles W. Holman, secretary of the National Federation of Milk Producers, states that this organization adopted a very significant resolution dealing with its position on the matter of government assistance to co-operatives while at their meeting in Milwaukee. This action was taken a day or so prior to the address of Secretary Hoover. The substance of their resolution is as follows:

"This federation is opposed in principle to all governmental subsidies to private business and to further governmental control of co-operatives through boards or commissions."

This is not an exact quotation, but is given by Mr. Holman as the substance of the statement. He states that the experience of the milk and butter co-operatives now federated into this organization, which constitutes those organizations whose members have had the experience and the years of effort, has shown that the only lasting benefits which co-operatives receive come from what their own members give to the organization. Present legislative efforts, he believes, while conceived in a spirit of real friendliness and desire to help, are more likely to hurt than to help. Co-operatives, he states, as a rule, can not benefit from governmental activities except as the results of governmental research into methods and the application and extension of present work in grading, standardization, and the inspection of interstate shipments.

Two interesting matters of dairy products standards are now before the Joint Committee on Standards and Definitions for decision, the ice cream standard which has been discussed a number of times, and the standard for sweet cream butter. The tentative definition on the latter subject, now put out for discussion and comment, limits the cream from which the butter can be made, to carry this name, to two-tenths of one per cent of acidity. The next meeting of the committee will probably be in January, when one or both these matters may come up for final decision.

The Dairy Markets section of the Department of Agriculture is watching the foreign market situation very carefully, realizing that relief through exports would greatly modify the possible trend of the seaboard markets for butter in this country during the next few weeks. Comment has already been made as to the fact that several shipments of butter have been made to London. It is reported that all of this has been of high grade stock, and a few of the shipments have been made direct from Wisconsin and Minnesota points to England. Close market observers believe that in these shipments and in the continued strength of the British market is found a real reason for the rather better market situation of the past few days.

It is pointed out here that the same weather conditions for the past six months which resulted in a world shortage of wheat and high world prices for wheat, had the same results in producing a shorter supply of butter than usual in countries other than the United States. Here the weather which gave us a big wheat crop also brought out a big butter production. There is the germ of a possible world butter forecast in this suggestion that is worth developing.

The National Dairy Union is in receipt of copies of official correspondence between J. D. Mickle, Dairy and Food Commissioner of Oregon, and Dr. Harvey W. Wiley which shows that in a "Voter's Pamphlet" issued by the Secretary of State in Oregon, and which contains arguments pro and con on questions which are coming up at the coming election there, some one has apparently deliberately mis-quoted Dr. Wiley on the subject of the food value of oleomargarine. The Oregon oleomargarine law is subject of a referendum vote this year, and this single false quotation from Dr. Wiley may well be pivotal in this contest. It is as follows, quoted from the "Voter's Pamphlet":

"In my extensive analyses of butterine and oleomargarine, nothing objectionable or injurious to health has been found. Oleomargarine as made today is pure, palatable, and more nutritious than butter."

(Signed) DR. H. W. WILEY.
Father of the Pure Food Act.

Asked definitely by Commissioner Mickle if he had made any statement to this effect, Dr. Wiley replied:

"I never have made any statement of the character quoted by you during the whole course of my life. * * * * * * * * * I have never declared on any occasion that 'Margarine is more nutritious than butter. In fact I have always taken the opposite position, provided the butter was palatable and pure, which unfortunately is not always the case."

The quotation in question was used in the pamphlet referred to by the oleomargarine committee, which has charge of the fight against the oleomargarine law in Oregon, which is to be voted on this Election Day.

Building Up a Herd

HOARD'S DAIRYMAN:—Some time ago I saw in your journal an inquiry from one of your readers in regard to the building up of a dairy herd. Your reader had seen somewhere a calculation that by starting in with two cows it was possible for the natural increase of the herd to bring the number of head up to 40 in 6 years. I have seen this same table myself and my own experience may show a considerable contrast which may be of interest to some of your readers.

In the early part of 1920 I started to build up a small herd of pure-bred Jerseys. At that time I bought two cows, both being in calf. Since that time I have to date bought nine more at various times, some of which I have sold to other breeders or to the butcher. The progeny of these cows to date amounts to 22 head, of which 14 were bulls and 8 heifers.

Of the original two cows I bought, one died after I had her for 2 years. She had two bull calves and one heifer. The other I still have and she is the best cow of the herd, having twice won the silver medal of the American Jersey Cattle Club for production and is now on her third test and should easily qualify for the gold medal. She had 3 bull calves and one heifer during the four years since I bought her. In other words, starting with two cows four years ago I would only have three today if it were not for the other cattle I have bought. Quite some contrast to the dream presented as a possibility of the herd of 40 cows in 6 years from two foundation cows.

I believe the presentation of such tables even though given as theoretical are apt to give such false impressions as to prove a great disappointment to some who may conceive that the figures are even approximately correct.

New York. J. A. R.

Idaho Short Course

The University of Idaho presents two terms of a short course in dairy manufacturing. The first term begins October 27 and closes January 17. It will cover, primarily, cheese and ice cream making. The second term begins January 19 and closes March 27. It will be devoted largely to butter making and market milk. Further details may be secured by writing Dairy Department, University of Idaho, Moscow, Idaho.

Satisfactory Progress

The doctor entered the grocery store. "How's the cheese today?" he asked.

"Well, it's a bit stronger, doctor," replied the grocer.—The Progressive Grocer.

Guernsey Awards at the National

Exhibitors:—Walter Alexander, Sanford Anderson, A. P. Bean, B. Behrens, C. J. & W. A. Connell, Julius Clausing, Louis Clausing, Albert Fruit, F. E. Fox, Sr., F. E. Fox, Jr., Clinton Griswold, E. W. Groeler, A. R. Hoard, J. M. Harvey, J. H. Hickcox, Albert Halvorson, Albert H. Hyzer, Anton Hollen, Catherine Jorgenson, Jones Bros. & Pritchard, Goodhand Kingston & Son, Geo. Konrad, George Kiel, A. M. Kailing, Wm. Larsen Canning Co., M. B. Lee, Geo. McKerrow & Sons Co., Elton Morgan, W. A. Munn, L. P. Martiny, Alfred Morawetz, Adolph Nuttleman & Son, Helen Owen, Ed. Pfrang, W. D. James, A. J. Plowman, Glenn C. Reynolds, F. J. Rueping, Wilbur Reed, Otto Rogney, Henry Riemer, George Reitz, Lorn Retzloff, Everette Smithback, W. H. Sullivan, M. A. Seybold & Sons, Seymour Bros., Tarr Bros., Chas. Tomfohrde, Ed. T. Williams, Elmer Weldon & Son, E. R. Whitcomb, Young & Rhymer, of Wisconsin; Emmadine Farm, (J. C. Penny, Owner) of New York; Joseph Golinvaux, Mountain Bros., Marple Mountain, W. W. Marsh, of Iowa; W. S. Jackson of Maryland; Simon Kruse, C. E. Swenson & Son, D. D. Tenney, of Minnesota; Cyrus H. McCormick, John L. Waddel, Geo. B. McKerrow & Son, of Illinois; E. S. Person of North Dakota.

The awards follow:

Bull, 4 yrs. or over—1, A. L. Hyzer on Lassie Boy of Prairie; 2, Joseph Golinvaux on Memento of Highland Place; 3, Swenson & Sons on Floridale General Washington; 4, W. A. Munn on May King's Duke of Waukesha; 5, F. E. Fox on Aviator of Edgemoor. Bull, 3 yrs. old and under 4—1, Emmadine Farm on Shorewood Resolute; 2, D. D. Tenney on Cherub's Royal Leader of Shorewood; 3, F. J. Reuping on Corium Princess Carrie's Champion; 4, L. P. Martiny on Proud Prince of the Prairie; 5, W. W. Marsh on Gold Star of the Prairie. Bull, 2 yrs., old and under 3—1, Mountain Bros. on Kitchener's Cavalier of Iowanola; 2, W. D. James on Silver Gem's King of James Farms; 3, Emmadine Farm on Florham Abbott; 4, Young & Rhyme on King Lewis of Orradale; 5, E. S. Person on Imogene's Prince of Iowanola. Bull, 18 mos. and under 2 yrs.—1, Larsen Canning Co. on Rose's Boy of Fern Dell; 2, Mountain Bros. on Betty's Master of Iowanola; 3, Emmadine Farm on Banner Rose's Wrangler; 4, McKerrow & Sons on Whimsome Lady's Ultra; 5, Elmer Weldon & Son on Sunny Mead's King. Bull, 1 yr. and under 18 mos.—1, Marsh on Cherub's Prospect of the Prairie; 2, Reuping on Corium Cherub's Edgar; 3, Mountain Bros. on Dorothy Marie's Challenger of Iowanola; 4, Glenn C. Reynolds on Goldemar of Koshkonong Place; 5, Tenney on Cherub's Royal Herald of Shorewood. Bull calf, 4 mos. old and under 1 yr.—1 and 4, Tenney on Cherub's Contender of Shorewood and Cherub's Royal Challenger of Shorewood; 2, Marsh on Gay Lad of the Prairie; 3, Reuping on Corium Ladock Prince's Forest; 5, Emmadine Farm on Valiant's King.

Cow, 5 yrs. old or over—1 and 5, Marsh on Honey Bloom of the Prairie and Marsh Marigold of the Prairie; 2, Tenney on Bell Buoy's Golden Lassie of City View; 3, Emmadine Farm on Moss Raider's Primrose; 4, Reuping on Polly of Hillsdale. Cow, 4 yrs. old and under 5—1 and 3, Emmadine Farm on Beda's May Rose of Island Farm and La Noce's Beda of Island Farm; 2, Marsh on Honeydew of the Prairie; 4, Person on May Rose Glory of Minot; 5, Larsen Canning Co. on Flossie of Bloom Farm. Cow, 3 yrs. old and under 4—1, 2, and 4, Emmadine Farm on Mixter May Princess, Foremost's Princess and Foremost's Queen; 3, Marsh on Peach Blossom of the Prairie; 5, Nuttleman & Son on Dairymaid's Dolly of La Crosse Valley. Heifer, 2 yrs. old and under 3—1 and 3, Tenney on Cherub's Lassie of Shorewood and Cherub's Deanie of Shorewood; 2 and 5, Marsh on True May Rose of the Prairie and Golden Queen of the Prairie; 4, Emmadine Farm on Daylo Yuletide. Heifer, 18 mos. old and under 2 yrs., bred by exhibitor—1, Reuping on Corium Elizabeth's Dolores; 2, Tenney on Cherub's Procris of Shorewood; 3, Marsh of Lilac of the Prairie; 4, Mountain Bros. on Dorothy Ilene of Iowanola; 5, Simon Kruse on Radisson's Queen of the Roses. Heifer, not in milk, 1 yr. old and under 8 mos., bred by exhibitor—1, Martiny on Proud Prince's Vernie of Chippewa; 2, Reuping on Corium Cherub's Dolla's Erma; 3, Marsh on Rose Petal of the Prairie; 4, Person on Cherub's Bettina of Minot; 5, Mountain Bros. on Cherub's Pearl of Iowanola. Heifer calf, 4 mos. old and under 1 yr.—1 and 3, Emmadine Farm on Foremost's Aurice and Resolute's Red Rose; 2 and 4, Marsh on Gladiolus of the Prairie and Sweet May Rose of the Prairie; 5, Tenney on Cherub's Dream of Shorewood.

Cow, under 4 yrs. old, having official yearly record—1 and 2, Emmadine Farm on Mixter May Princess and Foremost's Princess; 3 and 4, Marsh on Peach Blossom of the Prairie and True May Rose of the Prairie; 5, Clinton Griswold on Guernseydale Barbi. Cow, 4 yrs. old or over, having official yearly record—1, Tenney on Bell Buoy's Golden Lassie of City View; 2 and 5, Marsh on Honeydew of the Prairie and Marsh Marigold of the Prairie; 3 and 4, Emmadine Farm on Beda's May Rose of Island Farm and Moss Raider's Primrose. A. R. cow—1, Larsen Canning Co. on Flossie Gypson; 2, Martiny on Dairydette's Verena of Chippewa.

Get of sire—1, Tenney on get of Ladysmith's Cherub; 2, Marsh on get of Cherub's Prince; 3, Emmadine Farm on get of Langwater Foremost; 4 and 5, Mountain Bros. on get of Cherub's Winner and Cherub's Challenger. Produce of cow—1, Marsh on produce of Golden Cherry of Prospect Farm; 2, Emmadine Farm on produce of Yeoman's Mixter Diana; 3, Tenney on produce of Cherub's Promise of Shorewood; 4, Larsen Canning Co. on produce of Flossie Gypson; 5, Person on produce of Glencoe's Rose of Maple Hill. Exhibitor's herd—1, Tenney; 2, Marsh; 3, Reuping; 4, Mountain Bros.; 5, Person. Breeders' young herd—1, Reuping; 2, Marsh; 3, Tenney; 4, Mountain Bros.; 5, Martiny. Dairy herd—1, Marsh; 2, 3, and 5, Emmadine Farm; 4, Person.

Senior and grand champion bull—Shorewood Resolute. Junior champion bull—Cherub's Contender of Shorewood.

Senior and grand champion cow—Mixter May Princess. Junior champion cow—Corium Elizabeth's Dolores.

Brown Swiss Awards at the National

Bull 4 years old or over—1, Minette and Son on Emmett of Lake View; 2, Drollinger on Edgard L.; 3, Hull Bros. Co. on Carl the 13th; 4, Hess on Schilling's Reuben. Bull 3 years and under 4—1, Marshall and Son on Prince of Meadow Green; 2, Bower and Son on Edgard C. Bull 2 years old and under 3—1, Bower and Son on Elsie Nick A of Bowerhome; 2, Marshall and Son on Buster Brown of Osseo; 3, Minette and Son on Oliver Twist of Far View; 4. Schmid on College Lee; 5, Hull Bros. on Dale of Lake View. Bull 18 months and under 2 years—1, Marshall and Son on Ursula's Stasis; 2, Drollinger on James Edgard of Melrose; 3, Hull Bros. on Lottie Prince of Lake View; 4, Bower on Bonick of Bowerhome; 5, Minette on Delbery of Far View. Bull 1 year and under 18 months—1, Schmid on Maiden's Vronicka's College Boy; 2, Bower on College Boy of Bowerhome; 3, Minette on Believe's Grandson 3d of Far View; 4, Hess on Cato; 5, Hull Bros. on Beaut of Lake View. Bull calf 4 months old and under 1 year—1, Marshall on Styx Stasis 3rd; 2, Drollinger on Jim Larson; 3, Lila Schmid on Maiden's Master; 4, Minette on Lamark's Monte of Far View; 5, N. C. Schmid on Nelliemilitor.

Cow 5 years old or over—1, 3, and 4—Hull Bros. on Swiss Valley Girl 7th, Swiss Valley Girl 8th, and Swiss Valley Girl 10th; 2, Bower on Betty of Lake View; 4, Drollinger on Rose of Valley Grove. Cow 4 years and under 5—1 and 2, N. C. Schmid on Mollie's Nellie and Insurance Rose; 3, Jensen on Nona A; 4, Minette on Betty of Far View. Cow 3 years and under 4—1, Marshall on Fairview Valley M; 2, Hull Bros. on Nellie F Beaut; 3, Bower on Duchess on Bower Farms; 4, Minette on Doris Believe of Far View; 5, N. C. Schmid on Alpha Belle. Heifer 2 years and under 3—1, Minette on Believe Darling of Far View; 2 and 4, N. C. Schmid on Brown Ethel and March Molly 3d; 3, Hull Bros. on Margaret of Lake View 4th; 5, Marshall on Fairview Styx M. Heifer 18 months and under 2 years—1, N. C. Schmid on Marvel M 2d's Hazel; 2, Hull Bros. on Irene of Lake View; 3, Marshall on Stasis Rosalind; 4, Minette on Nagilla's Girl of Far View; 5, Bower on Elsie A of Bowerhome. Heifer not in milk 1 year old and under 18 months—1, Hull Bros. on Militor Emma of Lake View; 2, Drollinger on Carl's Lydia D. S.; 3, Bower on Betty A of Bowerhome; 4, N. C. Schmid on May of Meadow Green; 5, N. C. Schmid on Mernervie of Meadow Green. Heifer calf 4 months and under 1 year—1, Hull Bros. on Dale Valley Girl 8th; 2, Bower on Belle Beauty of Bowerhome; 3, Lila Schmid on Browney A's Last; 4, Drollinger on Edgard C's Queen; 5, Hull Bros. on Sylvia of Lake View. Cow 4 years old or over having official yearly record—1, 3, and 4—Hull Bros on Swiss Valley Girl 7th, Swiss Valley Girl 8th, and Swiss Valley Girl 10th; 2, Bower on Betty of Lake View; 5, N. C. Schmid on Cinnamon's Maiden. Cow under 4 years old having official yearly record—1, Hull Bros. on Nellie F. Beaut. A. R. cow with 2 of her progeny—1, Minette on Believe; 2, N. C. Schmid on Cinnamon's Maiden; 3, Hull Bros. on Nellie F. Beaut.

Get of sire—1, Hull Bros. on Get of Reuben; 2 and 5, N. C. Schmid on Get of Vronicka's College Boy; 3, Bower on Get of Nick's Prize Master; 4, Marshall on Get of Stasis Boy. Produce of cow—Hull Bros. on Produce of Swiss Valley Girl; 2, Bower on Produce of Elsie 4th of Lake View; 3, N. C. Schmid on Produce of Cinnamon's Maiden; 4 and 5, Marshall on Produce of Styx 2d and Produce of Styx. Exhibitor's herd—1 and 5, Bower; 2, Marshall; 3, Hall Bros.; 4, M. C. Schmid. Young herd—1, Marshall; 2, Bower; 3, Schmid; 4, Hull Bros.; 5, Minette. Dairy herd—1, Hull Bros.; 2, Bower; 3, Minette; 4, N. C. Schmid; 5, Marshall.

Senior and grand champion bull—Prince of Meadow Green. Junior champion bull—Styx Stasis 3d.

Senior and grand champion cow—Swiss Valley Girl 7th. Junior champion cow—Marvel M 2d's Hazel.

You and I are but cogs in one of the tiny wheels of the mechanism of Nature. Yet certain things are required of us and we must do our part.

Be good. Be kind. Be charitable. Others may see your faults even as you look upon theirs.

Oakland pioneered and perfected the application of Duco body finish to motor cars a year before this enduring finish was accepted generally.

This spirit of progress explains very largely why the Oakland Six is winning and holding the good will of all who buy it.

¶ Standard equipment includes four-wheel brakes, disc steel wheels, balloon tires, permanent top, Fisher Body, one-piece ventilating windshield on closed types, Duco finish, centralized controls, unit instrument panel, automatic spark control. ¶ Glass enclosures for open cars at small added cost.

Roadster $1095; Touring $1095; Special Roadster $1195; Special Touring $1195; Landau Coupe $1295; Coupe for Four $1495; Sedan $1545; Landau Sedan $1645. Prices at Factory

A Word of Appreciation

OCTOBER marks the Twenty-Fifth Anniversary of this company. A quarter century of hard-earned experience, toil, and growth is behind us. The years to come offer rich opportunities for continued service.

On this occasion it is fitting that we express our thanks to the friends who have helped us achieve success by their ready recognition of our high standards of manufacture.

We thank each of them and are proud and happy that there are so many to whom we can address these words of friendship and appreciation.

THE NEW IDEA SPREADER COMPANY
COLDWATER, OHIO

ATWATER KENT

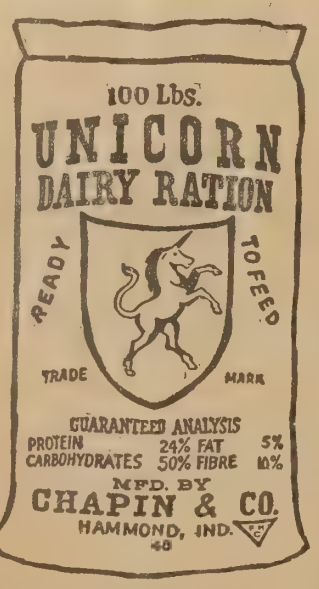
RADIO

In Selecting Radio for the Rural Home—Performance is the First Essential

IN ATWATER KENT Radio you get selectivity to tune out a station you do not want. Sensitiveness to bring in a station you do want. You get faithful reproduction; ample volume, without distortion, and it is easy to operate.

For distance, ease of tuning and reception without interference, ATWATER KENT receiving sets have no peer.

There is an ATWATER KENT instrument—receiving set or loud speaker to suit your preference,—in size, type and price, but only one standard—the best that can be produced with fine materials and master workmen.



Before you purchase a radio instrument:—see the ATWATER KENT line—examine it—and there will be no doubt as to your choice.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

A Flight With Wing

HOARD'S DAIRYMAN:—For twelve years now I have followed your paper and read it more or less all the while, and I must admit that I never had the pleasure (?) of reading an article of such magnitude as the one entitled "Contentment on the Farm" of September 19th.

I would be willing to bet the fellow that wrote it, Charles B. Wing, was on some flight when he did this stunt; also I would put up a year's subscription against two that the flighty Mr. Wing does not make his living by farming but rather makes it by farming the farmer. Now let's consider this article.

In the matter of food, the idea seems to prevail, according to Mr. Wing's flight, that the country man lives to eat. That is not so. He eats to live just as the city man does.

Food for the mind comes as much or more from contact with other men as from contact with great libraries. Also, if a man rises at four in the morning and is milking three times a day, delivering his own milk, as I do, doing his own dairy work, caring for his cattle and chickens without any help and at the same time caring for his cattle and barns and maintain a production of 50 gallons a day, when, I ask the flighty Mr. Wing, are we countrymen going to get the time to read, etc.?

Again on the food for the soul, Wing says he looks out on the first of May, etc. If he was a regular farmer and not an agriculturist he might by chance look out on the first or even the 15th of January or February and see it snowing and blowing with a low temperature and ten long, hard, cold miles of snow-blown road. He would get a soul full of food on a few trips like that so that he would not have to wait till the "first day of May".

Wing takes another flight on rest following the cows. Yesterday I followed a heifer in heat at the end of a ten-foot rope and for ten years I have followed the four- and three-times-a-day milking. In both cases there seemed to be little rest following the cows.

This kind of tommyrot is all right for the agriculturist, but does not go very well with the farmers.

I always thought you prided yourself on putting out a farmers' paper.

Think it over.

Maine. A. W. JONES.

No Overproduction

HOARD'S DAIRYMAN:—Why advocate idleness in children or grown-ups? Is it not true that humanity lives by the sweat of its brow? All we have is produced by labor. If we do not (sow) *labor* neither shall we reap. Inasmuch as organized labor can force the idle rich to work by shortening its hours and raisings its wages well and good, but when they take from other workers what they justly earn it is nothing short of organized theft, just as war is organized murder.

There is not overproduction. If so, why do some starve? Why are some (the workers and poorer classes) in want of the common comforts of life? It is not always because of the waste of the rich but because some, in fact many, able laborers refuse to produce their just portion and because of unequal distribution. The greater the production, the greater the bounties of the people of the world. Any slacker takes from the grand total. Much labor is directed in wrong channels because we have attained no better adjusted system or we do not utilize the product properly. Overproduction is a myth of the gambler and the lazy. *There is no overproduction.*

Michigan. R. W. STEED.

Will "Pittsburg Plus" Decision Affect Prices

HOARD'S DAIRYMAN:—Since the Federal Trade Commission issued its recent decision in the "Pittsburgh Plus" case, a great deal of publicity has been given to the statement that "Pittsburgh Plus" "adds thirty million dollars annually to the cost of steel products bought by farmers in eleven middle western states."

The inference from this statement is that "Pittsburgh Plus" has added and is continuing to add heavily to the cost of farm machinery and that, because of the decision of the Federal Trade Commission, farmers could reasonably expect a material reduction in the price of farm inplements. An examination of the fact shows this not to be the case.

The statement is misleading and is not based on the present situation in the steel industry. Since October, 1921, there has been no "Pittsburgh Plus" quotation on bars, shapes, and plates. Pig iron, of course, is not steel and has never been quoted on a "Pittsburgh Plus" base. Bars, shapes, and plates and pig iron constitute by far the main iron and steel products purchased for the manufacture of farm implements, and farm machinery manufacturers who have been interviewed say that saving brought about by the discontinuance of "Pittsburgh Plus" rates in October, 1921, has already been reflected in farm machinery prices prevailing since that date.

Commodities on which "Pittsburgh Plus" prices still obtain, include wire, wire products, sheets, tin plate, and steel pipes, and of these very little is used by farm machinery manufacturers.

For example, a manufacturer of heavy farm machinery, such as threshers, tractors, etc., near Chicago, advises us that on all its purchases in 1923 approximately only 125 tons of material came under the "Pittsburgh Plus" price quotation, and the "Pittsburgh Plus" increase on this material amounted to less than $600.00 and this amounted to less than 7c per machine.

The testimony on which the increased cost to the American farmers were based was given prior to October, 1921, but inasmuch as the steel companies since then voluntarily relinquished "Pittsburgh Plus" on most of the material used in farm machinery, the conditions set forth in the testimony do not apply at the present time.

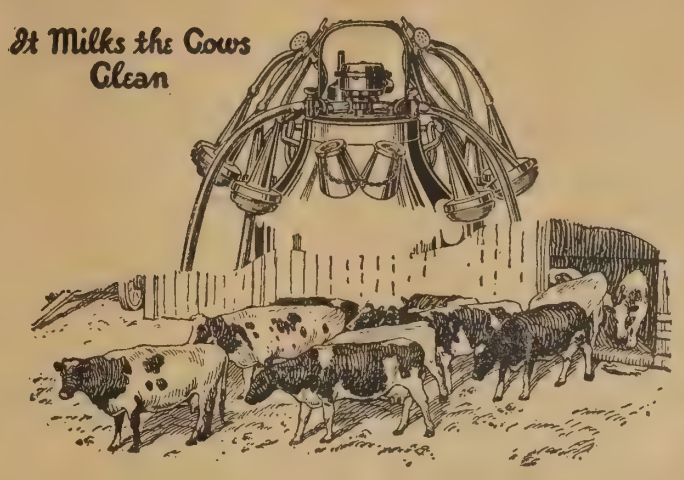
As it now stands, elimination of "Pittsburgh Plus" cannot materially affect the price of farm machinery. If, however, the decision of the Federal Trade Commission should be applied and overruled, there would be nothing to prevent the reinstatement of the "Pittsburgh Plus" quotations on bars, shapes, and plates, and because of this situation, farm machinery manufacturers are hopeful that the decision of the Federal Trade Commission will not be appealed or if appealed, will be sustained.

Illinois. N. A. M.

Grade Sale at the National

The sale of grade cows with cow testing association records at the National Dairy Show comprised 83 head, including 14 bred heifers having dams producing over 350 lbs. fat in a year. These cows had an average yearly production record of 379 lbs. fat and they sold for an average of $123 each. At the National Dairy Show in St. Paul two years ago, 35 head of grade cows, averaging 420 lbs. fat, sold for an average of $151 each.

Buyers were not plentiful and with a few exceptions the bidding was not spirited. Most of these cows were sold at bargain prices and the new owners may be happy in contemplating that they cost them less than the cows would have sold at home to the neighbors of the consignors. In fact, a large number of them did stay in Wisconsin.



There were possibly two things that militated against the sale. Reluctance of bidders because of fear of not getting full carloads and the fact that a very considerable number of the cows were six to eight years old. Every cow sold was straight and right in every way, and were either heavy in calf or recently fresh. With butter at only 33 cents a pound, these cows would more than pay for themselves within the next twelve months.

The former owners of these cows were reluctant to consign them to sale and only did so out of loyalty to the cow testing association idea and for the purpose of advertising their several localities. However, although they have lost money in many cases, they have done a good piece of work and have distributed good cows to many communities as examples of profitable production through testing. We sympathize with them and congratulate the buyers.

The sale was capably managed by C. L. Hill, Wm. Baird, and Glenn Vergeront. The auctioneers were J. E. Mack and O. G. Clark, ably assisted in the ring by R. L. Benjamin, C. F. Pohlman, and Levi Jones. Following is a list of the records of the animals and price at which they sold:

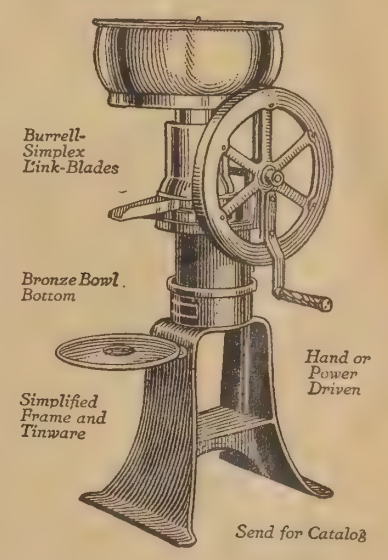
Are *Your* Cows Milked with a Burrell?

THESE cows are milked with a Burrell Milker—and they are milked *right*. Unless yours, too, are milked with a Burrell, you and your cows have a better day ahead—the day they *are* milked with a Burrell.

Why not profit from a Burrell Milker? It has been continuously on the American market longer than any other power milking machine. It was practically perfect years before many other milkers were even made. There isn't a single *doubt* in the Burrell—not an experimental feature.

The man who can milk by hand as well as a Burrell milks is a rare "species". And the Burrell is so simple that almost anyone can operate and care for it. Moreover, it is profitable on fewer cows than you may think. Why not put your dairying on a better basis—with a Burrell Milker?

Ask your dealer about the Burrell Milker and send to us for catalog. Please address Dept. 10.



D. H. BURRELL & CO. INC. LITTLE FALLS, NEW YORK

A Burrell Separator

The name is a guarantee

The name Burrell has been associated with the dairy industry since the days when Herkimer County cheese had to be hauled by wagon or sleigh to Albany and shipped on scows to New York. Upon farm dairying and cheese making rests the beginning of the Burrell manufacturing business. Since 1860 the Burrell company has been a leader of improved methods and equipment for the dairy farmer. The Burrell Cream Separator is a worthy member of the Burrell family of *quality* dairy machinery. For clean skimming, light running and long service, it is hard to equal.

It Skims the Milk Clean

MILKING MACHINES AND CREAM SEPARATORS

Over the Ton Mark in Six Months

Over the ton mark with a litter of seven pigs in 180 days is the wonderful feeding achievement of Chris Brockman, Spencer County, Indiana farmer and hog man, an entrant in the Hoosier Ton Litter Contest, conducted jointly by the Agricultural Extension Department of Purdue University and the Indiana Live Stock Breeders' Association. He is the first man in the state to feed out a litter of only seven pigs to the ton mark in six months and so far as is known is first in the entire nation.

The total weight of the litter was 2,046 pounds or 292 pounds each. Brockman also won a gold medal last year when the same sow raised a litter of nine pigs to a weight of 2,240 lbs. at six months.

"I felt sure that I could make it again but the sow laid on two of her litter of nine this year and I had only the seven left to go ahead," said Mr. Brockman. "That second gold medal was only nibbling. It hadn't taken hold of the bait at all."

However, Mr. Brockman kept the hook well baited. After the pigs were two weeks old, the dam got all the corn, wheat, shorts, and skimmilk she would eat, and she converted it into milk for her pigs. From weaning time on, the pigs got all the cracked wheat and skimmilk they would eat, and had the run of a lespedeza and blue grass pasture.

In explaining why he fed wheat instead of corn, Mr. Brockman said corn was scarce in his locality last year and that wheat was "just as cheap as corn". Here is how he figured it: Corn was worth not less than $1 per bushel. There are 35.7 bushels of corn in a ton, making it worth $35.70 a ton, wheat averaged about $1.10 a bushel, with 33⅓ bushels in a ton, making it worth $36.67 a ton, plus the cost of cracking, thus totaling about $39. But wheat, when cracked, is worth a tenth more for hogs than corn, and his cost was no greater than if he had fed corn.—Purdue Experiment Station.

The funny column of a daily paper tells of a teacher who asked Willie to locate several cities and he answered, "I can't locate 'em but I know how to tune in on every blamed one of 'em."

Stout Dispersal Averages $1,800.35

Fifty-four head of Guernsey cattle, formerly the property of the late Harry L. Stout and his father, F. D. Stout, were sold at the Chicago Guernsey Farm, Illinois, October 3rd, for $97,215, or at an average of $1,800.35. This is the highest sale average of any breed for several years. It was surpassed by the famous Langwater sale when 96 animals were sold for an average price of $2,738.85. Lone Pine Guernseys were famous both as producers and in the show ring. Guernsey enthusiasts regret that it was necessary to scatter these animals to various parts of the country because, under Mr. Stout's management, much could have been accomplished in the future. The average of $1,800 shows the respect that constructive breeders all over the country possessed in regard to the wisdom and judgment used in selecting and breeding the Lone Pine Guernsey herd.

One interesting feature of the sale was the bidding on individuals possessing Cherub blood. Cherub's Pearl Royal of Shorewood, who stood at the head of this herd, had fifteen daughters in the sale that sold for an average price of $1,293. They were all yearlings or calves.

A good crowd of buyers was on hand when Auctioneer Bain started the sale with Moss Raider's Polly in the ring. One thousand dollars was the first bid and in a few minutes this individual was the property of W. H. Williams, New York, for a price of $3,000. Mr. Williams was the heaviest purchaser of the day. He bought Lone Pine Mollie Cowan, a daughter of Langwater Hayes Rosie's King of the May and out of a daughter of Murne Cowan, for $15,100. Mr. Williams' representatives were closely pressed by Jimmy Dodge, manager of Emmadine Farm, and Capt. Dunning, manager of Caumsett Farm. Emmadine's last bid was $15,000. Lone Pine Mollie Cowan has a junior two-year-old record of 703 lbs. of butterfat and is now making a good record as a four-year-old that will place her very close to the top. Six head were sold to Mr. Williams for $37,700, an average price of $6,284.

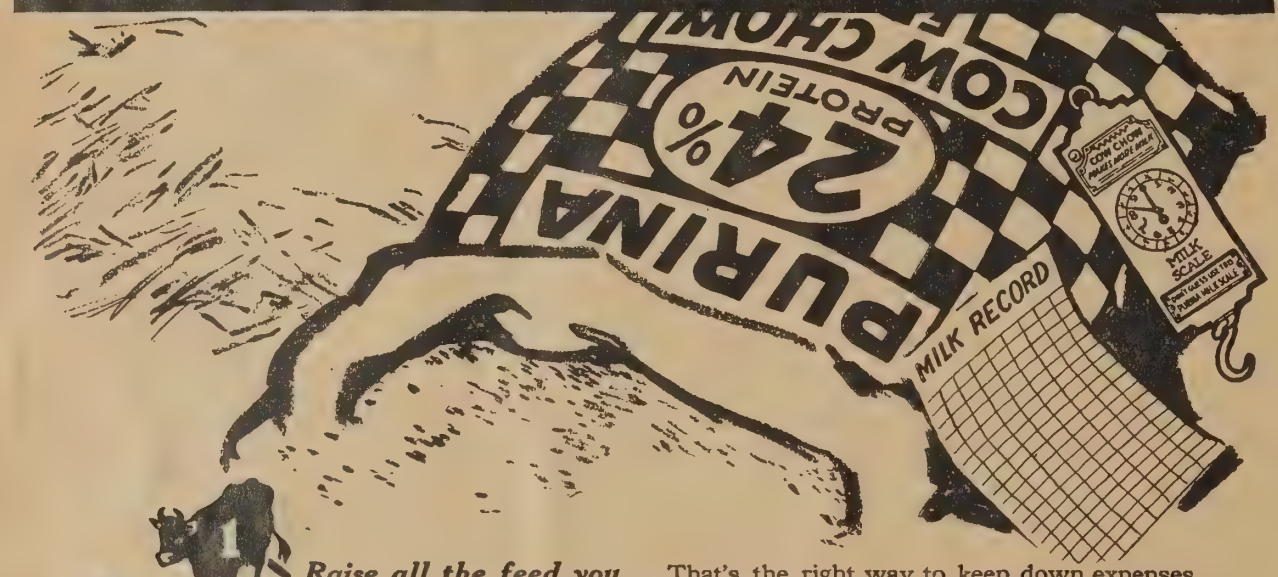
Many people were interested in the two daughters of Gerar Pearl. These two cows come from a great family and several breeders had hopes of being able to add both of them to their own herds. Williams bought Gerar Pearl's daughter for $12,500 and Royal's Pearl of Pomeroy went to Marshall Field's Caumsett Farm, Long Island, for $12,750.

Caumsett Farm placed the last bid on seven animals with a total value of $25,050. Royal's Pearl of Pomeroy, second high cow of the sale, was one of their purchases. She has a junior three-year-old record of 623 lbs. of fat in the double letter class.

Two great families were prominent in the Stout herd. The Cherub family we have previously mentioned and the other was the Gerar Pearl family. Eight animals carrying a good percentage of Gerar Pearl blood brought $40,450.

The bull, Gayhead's Ultra May King, which was purchased just before Mr. Stout's death, was sold to August Ziesing, Illinois, for $2,200. This bull is well along in years, yet he will prove a valuable addition to the Thorn Hill herd.

The sale was well managed by Charles Hill and every detail was taken care of in a very impressive manner. The cattle were fitted and handled by Sly.



The following list includes the animals selling for more than $1,000 and their buyers:

W. H. Williams, New York	
Moss Raider's Polly	$ 3,000
Kenilworth's Milkmaid	2,600
Gerar Pearl's Daughter	12,500
Lone Pine Daughter's Diamond	3,600
Lone Pine Mollie Cowan	15,100
Caumsett Farm, Long Island	
Langwater Royal 4th's Belie	$ 1,100
Royal's Pearl of Pomeroy	12,750
Lone Pine Pearl Maiden	3,700
Lone Pine Daughter's Sapphire	4,500
Lone Pine Delightful	1,200
Lone Pine Debonair	1,300
Emmadine Farm, New York	
Lone Pine Miss Locust	$1,100
Ultra Lady of Uplands'	3,800
Mrs. R. R. McCormick, Illinois	
Lone Pine Delight	$1,200
Lone Pine Princess' Royal	1,400
D. A. Dunlap, Canada	
Lone Pine King's La Belle	$1,050
E. A. Moore, Connecticut	
Lone Pine Pretty Pearl	$1,400
F. W. Brandt, Wisconsin	
Lone Pine Dia	$1,250
Aug. Ziesing, Illinois	
Gay Head's Ultra May King	$2,200
D. D. Tenney, Minnesota	
Langwater Desire	$2,500
Geo. O'Neil, Wisconsin	
Lone Pine Victoria	$1,175

The outbreak of foot and mouth disease in Southeast Texas seems to be well under control. This outbreak involved herds consisting of 1,900 animals which have been slaughtered and buried. There is a corps of forty-five trained veterinarians and guards in charge of the territory which has been quarantined and it is being watched closely for any new outbreak. A week has passed since the slaughter of these three herds without a report of any more animals contracting this disease. It is to be hoped that all the infection has been buried. Since it requires from four days to three weeks for foot and mouth disease to develop after an animal has been exposed, it will be at least a month before we can feel that the disease has been destroyed.

Uncle Ab says the man who treats his horses well in the fall will treat them well the other three seasons of the year, and that's the only way to do anyhow.

A Plan that's Making More Milk at Less Cost

1 — *Raise all the feed you can.* That's the right way to keep down expenses.

2 — *Use just enough Purina to supply what your own feed lacks.* Purina makes a balanced ration with your home grown feed, so your cows give the greatest quantity of milk and keep in the best condition.

3 — *Follow feeding directions in the bag.* You don't have to experiment with Cow Chow. Profit by the experimenting of thousands of *other* dairymen. They have proved that if Cow Chow is fed right, it will make an average of a half gallon of extra milk per day.

4 — *Be fair to yourself and Purina by giving it 30 to 60 days to prove itself.* Cow Chow can't work wonders over night. 2 to 4 bags to each cow is the right quantity to start. This is enough for 30 to 60 days.

5 — *Don't guess. Keep track of your milk production and feed cost.* Weigh your milk regularly, and keep a record of how much it is costing you *now* to produce a gallon of milk. Then keep a record of the extra milk when you use Cow Chow—and note how *much less it costs to produce it!*

6 — *If Cow Chow doesn't make you more money, don't feed it.* But Cow Chow *will.* Order it from your dealer or mail us your coupon for the 100-page Purina Cow Book—free.

Eight Busy Mills Located for Service

THE GRADE COW EXHIBIT

THE fundamental basis of profitable dairying was emphasized in the grade cow exhibit at the National Dairy Exposition. Something over 200 cows were assembled from cow testing herds in Wisconsin whose average production was close to 400 pounds fat in a year. In addition there were special exhibits featuring the difference in production of cows, the value of the good sire as shown by the records of his daughters, and a freight car to illustrate the best methods of shipping cattle.

This noteworthy and well timed exhibit was sponsored by the Wisconsin Dairymen's Association in co-operation with the Wisconsin College of Agriculture. To the discriminating and inquiring visitor this co-operation was a lesson in itself of a unity of forces for better agriculture that has been of larger value in building up the prosperity of the state than its more talked of legislative and political history. The various agencies and men of Wisconsin have sunk political differences and personal advantage in their promotion of more profitable farm practices and because of this have achieved an outstanding success.

The responsibility for this particular show was placed on the shoulders of Mr. A. J. Cramer, one of the supervisors of cow testing work in Wisconsin, and he fulfilled the confidence placed in him. But here again we note the same co-operative spirit, for his success was based on the assistance given by many agencies and men, including the National Dairy Show, the Dairymen's Association, the College of Agriculture, the Live Stock Breeders' Association, cow testers, county agents, and many others. Last, but not least, was the loyalty of the members of cow testing associations who exhibited cows at no inconsiderable sacrifice of time and money. These farmers give full proof of their loyalty to the idea of the basis of profitable dairying, the good cow well fed. Membership buttons of the Wisconsin Dairymen's Ass'n. stressed the real purpose of this work—*Better Homes*—with the words: "Better cows, better fed, better profit, better homes, through testing."

The Educational Exhibit

As one entered the large exhibit barn placed at the disposal of the cows with cow testing association records, the first thing to be noted was the Steps of Progress, illustrating how cow testing associations with pure-bred bulls have improved the production of Wisconsin dairy herds. Here were shown cows representative of the average production of all cows in the United States of 160 pounds butterfat for a year, of all Wisconsin cows of 190 lbs. fat, of all cows in Wisconsin Cow Testing Associations of 273 lbs. fat, of the best producing association average of 341 lbs. fat, of the best producing herd average of 534 lbs., and finally "Kit", the highest producing grade cow with a record of 804 lbs. fat.

Next down the line were shown eighteen grade Holsteins from the Rockwell and Katterhenry herd that had been tested in the Beloit Association. Nine of these, including Kit, were daughters of Mercedes Lad Johanna Son. These half sisters have an average production of 14,355 lbs. milk containing 497 lbs. fat. The younger group of 9 females were daughters of Ormsby Pontiac Maple Crest. The six cows of this group that were in milk have averaged 307 lbs. fat at 2½ years of age. Here again was emphasized the value of the pure-bred bull and of testing, but quite as valuable was the opportunity given visitors to meet and talk with Mr. Katterhenry who has fed and cared for these cows and knows how to run a dairy farm as few men do.

The Grades in the Show Ring

Professor H. H. Kildee of Iowa had a difficult job in placing these good cows in the show ring, but he acquitted himself well and to the satisfaction of the exhibitors and the spectators. The awards were based on dairy quality as shown by the eye, and no consideration was given to records. As a natural result some high producing cows received no placing.

Liberal premiums were offered by the management of the National Dairy Exposition, ranging from $30 for first place to $10 for tenth place. In the Holstein classes the National Association was very liberal in offering $250 to be divided between the winners of the eleventh to the twenty-fifth place in the first two classes. The Guernsey Association awarded a silver cup to the champion Guernsey cow, and to the winners of first place in the first three classes was given a pure-bred Guernsey bull calf of good ancestry.

The Holstein Awards

The exhibit of Holsteins contained 137 cows, sixty of which, as shown in the aged cow class, had records averaging 408 lbs. fat. In listing the awards we give first the record of the cow, then the name of the owner, and lastly the name of the cow testing association. The first five placings in each class are given below:

Aged cows with over 350 lbs. fat: 1—413 lbs. fat, Sol Engle, Waukesha—Genesee; 2—354 lbs., Mrs. A. Tessene, Whitewater; 3—804 lbs., Rockwell & Katterhenry, Beloit; 4—365 lbs., Paul Moritz, West Bend; 5—458 lbs., E. Rudd, Menomonie.

Cows under four years with records of over 250 lbs. fat: 1—337 lbs., Rockwell & Katterhenry, Beloit; 2—387 lbs., Van Reuden Bros., Palmyra; 3—385 lbs., Van Reuden Bros.; 4—367 lbs., J. C. Held, Slinger; 5—292 lbs. Rockwell & Katterhenry.

Bred heifers from cows qualifying in first two classes: 1 and 4—Rockwell & Katterhenry, Beloit; 2—Fred Pamperin, West Bend; 3—Leon Bluemke, Rosendale; 5—Roy Williams, Waukesha.

Group of five cows from one association: 1—Beloit (ave. 550 lbs. fat); 2—Allenton—Kohlesville; 3—Edgar; 4—Richfield; 5—La Grange.

Group of four cows get of one sire: 1 and 4—Beloit; 2—Allenton & Kohlesville; 3—La Grange; 5—Waukesha—Genesee.

Group of five cows owned by one exhibitor: 1, 3, and 5—Rockwell & Katterhenry, Beloit; 2—Van Reuden Bros., West Bend; 4—S. L. Mann, Waukesha.

Champion: 413 lbs., Sol Engle, Waukesha.

KIT, A GRADE HOLSTEIN, HAS THE HIGHEST C. T. A. RECORD OF ANY GRADE COW IN WISCONSIN

She produced in one year 23,374 lbs. milk containing 804 lbs. fat. She was exhibited with the record cows by Rockwell & Katterhenry of the Beloit C. T. A.

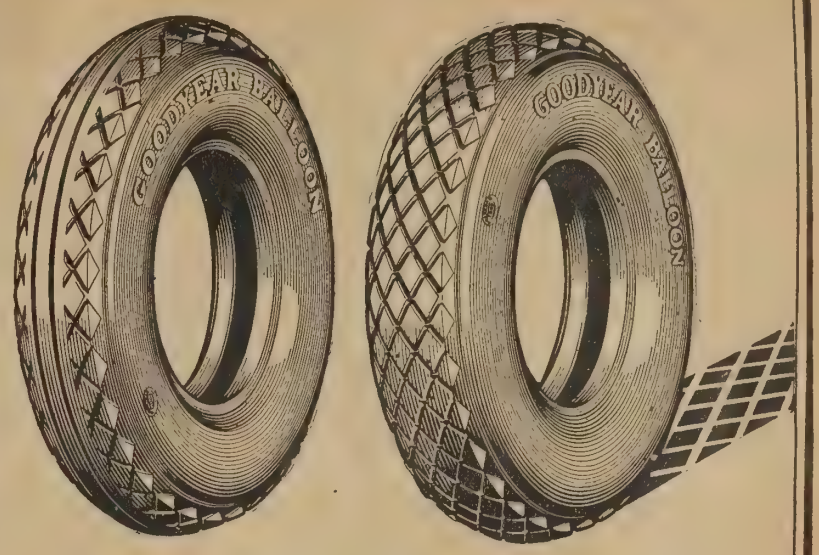
The Guernsey Awards

There was a total of 43 Guernseys lined up in the show ring. Thirty of these in the aged cow class averaged 419 lbs. fat. In listing the awards we give first the record of the cow, then the name of the owner, and lastly the name of the cow testing association. The first five placings in each class are given below:

Aged cows with over 350 lbs. fat: 1—570 lbs., C. A. Riek & Sons, Dunn County; 2—405 lbs., Robt. Peichl, Whitewater; 3—441 lbs., W. F. Gerlach, Palmyra; 4—391 lbs., Robt. Peichl; 5—512 lbs., Scott Steward, Richland Center.

Cows under four years with records of 250 lbs. fat: 1—284 lbs., C. B. Thatcher, Dunn Co.; 2—287 lbs., Wm. Lonsdorf, Marathon; 3 345 lbs., F. Lieurence, Viola; 4—215 lbs., John Thuron, Wilton; 5—275 lbs., Mrs. M. Rockman, Barron.

Bred heifers from cows qualifying in first two classes: 1—Burchard & Peters, Fort Atkinson; 2—W. Matthys, Barron; 3—W. Brandon, Wilton; 4—H. Brandon, Wilton; 5—F. Abbs, Eldorado.



Group of five cows from one association: 1—383 lbs., Whitewater; 2—440 lbs., Richland Center; 3—383 lbs., La Grange.

Group of four cows sired by one bull: 1—Whitewater; 2—Richland Center; 3—Palmyra.

Group of five cows owned by one exhibitor: 1—Robt. Peichl, Whitewater; 2—Scott Steward, Richland Center; 3—W. F. Gerlach, Palmyra.

The Jersey Awards

There were only six Jerseys shown by two exhibitors. In the aged cow class R. H. Cooper of Richland Center Association took champion cow and places 1, 2, 3, 5, and 7 with cows having records, respectively, of 357, 448, 463, 480, and 385 lbs. fat each. Fourth and sixth places were taken by H. Hubert of Wilton with cows having records of 440 and 394 lbs. fat each. R. H. Cooper, the only entrant, took first place in the bred heifer class and in the three groups.

Out of its many years devoted to pioneering and developing the cord tire, perfecting the multiple-ply method of construction, and carrying on the various cord tire refinements from year to year, Goodyear has learned that the essential strength and usefulness of a tire come from the fabric of which it is made. Now, in that remarkable new Goodyear cord fabric development—SUPER-TWIST—Goodyear contributes another impressive advance in tire material. It is a balanced cord fabric, of great endurance, of great elasticity, of great shock-absorbing and wearing strength. It is the supreme cord fabric you get only in Goodyear Balloon Tires.

Goodyear Means Good Wear

Try This Improved Water Bowl for 30 Days FREE

Operates on any pressure up to 100 lbs.

SIMPLEX

"Cleaned in 5 Seconds"

Many of the most prominent breeders in America have installed Simplex bowls after making this trial. E. C. Shroeder, Holstein breeder, Moorhead, Minn., says, "The Simplex is the best bowl we have ever seen." Why risk buying a less efficient bowl when you can test the Simplex without cost or obligation? Sample sent free, prepaid. No deposits or promises asked of you. Try it, test it in every way. Then buy for your barn, pay for the sample only; or return it—just as you please.

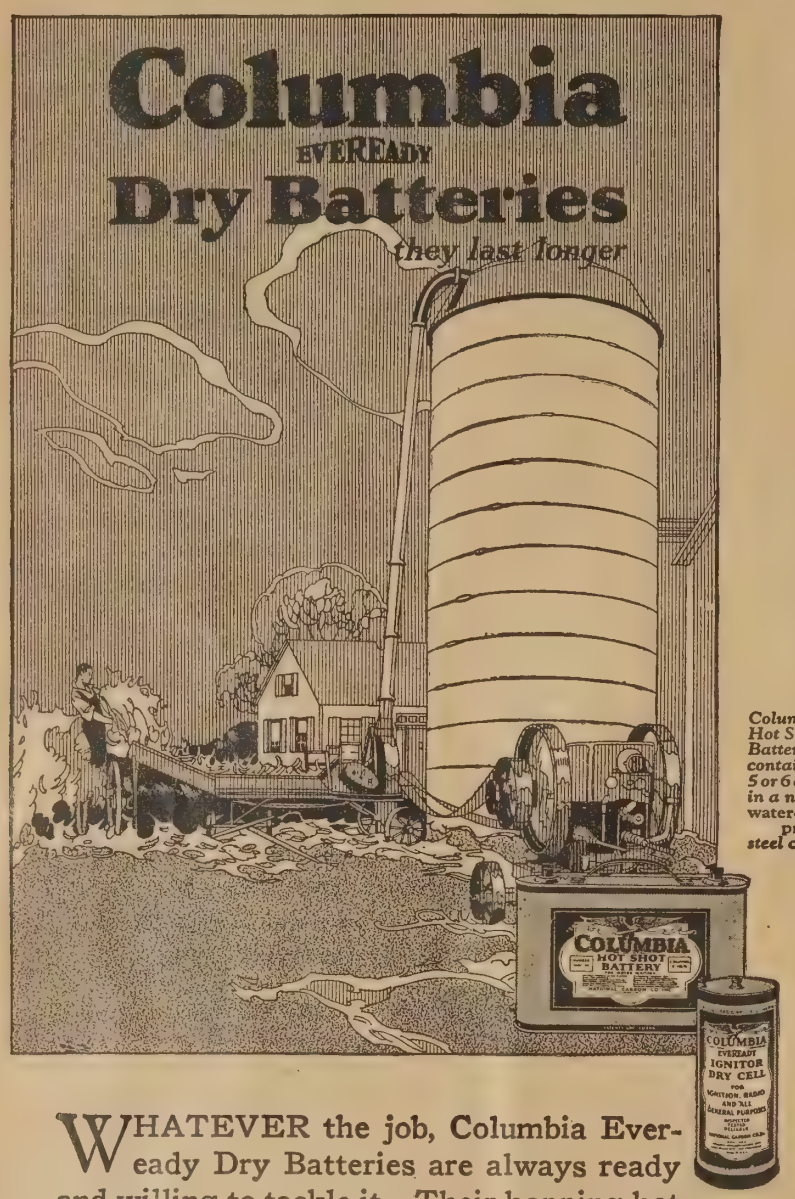
We know the Simplex is so plainly superior that it will sell itself. YOU know the vital importance of providing your stock the best possible bowl. Hence this offer.

Send the Coupon—that's all

F. RASSMANN MFG. CO.

Dept. 28-57 Beaver Dam, Wis.

Eastern Distributor: Uebler Milking Machine Co., Vernon, New York.



You may send me a sample Simplex Automatic Water Bowl, free and prepaid. It is understood that I will try this bowl for 30 days without any obligation to buy. After trial, I will either return the bowl to you or remit its price of $3.50—or order for my barn.

Hot sparks put punch into pistons

Columbia Hot Shot Batteries contain 4, 5 or 6 cells in a neat water-proof steel case.

WHATEVER the job, Columbia Eveready Dry Batteries are always ready and willing to tackle it. Their hopping hot sparks zip into cylinders with lightning speed. They put push into pistons. Hook Columbia Eveready Dry Batteries to the engine that runs the ensilage cutter, the concrete mixer, the water pump, any construction, farm or home appliance and you get steady power at its maximum.

Columbia Hot Shot in its steel case defies water—no amount of wet can dampen the enthusiasm of its sparks. Between jobs, Columbia Evereadys renew their strength.

Don't just ask for "a dry cell." Ask for "Columbia Eveready" by name and get 100% battery efficiency. Columbia Eveready Dry Batteries are sold by implement dealers, electrical, hardware and auto accessory shops, radio and marine supply dealers, garages and general stores. Columbia Eveready Ignitors can be purchased equipped with Fahnestock Spring Clip Binding Posts at no extra cost to you.

Association Notes by Testers

Kane Co. No. 2, Ill.: The average production of 514 cows in milk last month was 677 lbs. milk, 23.7 lbs. fat, a little less than in August, but more than in September, 1923. Abundant fall feed helped to lower the feed cost per cwt. of milk 8c but because of lower average returns, profit above cost of feed per cow showed a decline of 18 cents. Another herd had its first tuberculin test. Only one out of 35 head reacted. Two members purchased drinking cups. Due to the lateness of the corn crop and other work, few silos have been filled, which is unusual for the end of September. Market milk sold for $2.60 in September and retailed for 10—13c per qt. —W. K. Bullock.

Dubois Co., Ind.: Two silos were built. Market milk sold for $5.00 per cwt. and retailed for 12c a quart in September. The creamery paid 40c per pound for fat. Fat for ice cream brought 65c a pound.—R. C. Carter.

West Dakota Co., Minn.: Silo filling is nearly finished, as is also the third crop of alfalfa. Market milk sold for $2.20 per cwt. last month.—L. L. Hammond.

Connecticut Valley, Vt.: In August one member built a silo. Another purchased a large farm. The high cow for that month, a three-year-old in eleventh month of lactation, has appeared in quality list every month. —S. M. Curtis.

Prince William Co., Va.: This association ended its second year of testing with an annual meeting the last of August. It reorganized with an increased membership. W. M. Johnson was elected president, J. B. Manuel, vice-president; and Jack Pullen, secretary-treasurer. The consignment sale held September 17th at Clover Hill Farm was the first of its kind held in Virginia and was a success. Twenty-three animals consigned averaged $119.68. The high cow consigned by Clover Hill Farm brought $210. W. J. Burlee, Virginia, paid this price for her. The following day F. M. Swartz's sale of his 19 grade Holsteins averaged $138. Market milk sold for $2.38 per cwt. and retailed for 14 cents per qt. in September.—T. T. Curtis.

Watertown, S. Dak.: Thirteen herds have been tested for tuberculosis and eight of them are on the accredited list. The association average for the month of September was 54.6 lbs. milk, 20.34 lbs. fat. Market milk sold for $2.00 per cwt. last month. The creamery paid 36c a lb. for fat. Milk retailed for 10c a quart, butter 40c a lb.—H. E. Erickson.

Branch, Mich.: Fifteen members feed grain to supplement pasture. Farmers are becoming disgusted at the low price for condensed milk and butterfat because of the millions of pounds butter in storage. An advance is looked forward to and will be appreciated. Market milk brought $2.50 per cwt. and retailed for 12 cents per qt. in August.—L. Q. Kitchen.

St. Joseph, Mich.: One cow produced over 60 lbs. fat, two over 50 lbs. fat, and 15 over 40 lbs. in August. One concrete silo is being built. Many members are sowing alfalfa this year. Market milk sold for $2.82 per cwt. in August.—R. S. Tompkins.

Green Co., Mo.: Of the 371 cows tested, 18 produced more than 40 lbs. fat, three more than 50 lbs., and nine more than 1,000 lbs. milk. Two members began selling milk at wholesale. Market milk sold for $2.50 per cwt.—V. L. Gregg.

Saukville, Wis.: Several members whitewashed and improved their barns, putting in new stanchions and cement mangers. The condensery paid $1.88 per cwt. for milk in August.—N. J. Schackmuth.

Independence, Wis.: The Independence and Whitehall Associations will hold the first cow testing association sale in Trempealeau County in October. In September the creamery paid 40—42c per lb. for fat.—P. Nelson.

Tennyson—Dickeyville, Wis.: Twenty-four cows produced over 40 lbs. fat in September. The highest herd average was made by Joe Kowalski, of 34.7 lbs. fat, 800 lbs. milk. The highest herd average for six months was also made by Mr. Kowalski. The creamery paid 38—39c a lb. for fat, the cheese factory 39c a lb. last month.—Joe Aufdermauer.

Coon Valley, Wis.: Silos are now being filled, but the corn is nothing extra this year. Most members feed alfalfa with pleasure. New equipment is being installed in a dairy barn. The creamery paid 40c per lb. for fat in September.—W. H. Klahn.

Verona, Wis.: Three herds were tested for tuberculosis and two herds passed a clean test. A few barns were whitewashed. A large number of members attended the Dairy Show. Market milk sold for $2.10 per cwt. The condensery paid $1.65 per cwt. for milk and the cheese factory $1.54. The creamery paid 47c a lb. for fat. Milk retailed at 9c a quart, butter 46c a lb., in September.—G. W. Weihing.

Lehigh Co., Pa.: One member purchased an additional silo. One herd was tested for tuberculosis for the first time and another herd retested. All members feed grain while cows are on pasture. Price for market milk was $2.80 per cwt. in September.—W. W. Sassaman.

Sheldon, Wis.: Three silos were built last month. Cows on poor pasture and receiving no grain have dropped 50% in milk. At a sale, cows with good association records sold for $30 more than those with poor records. Members reading Hoard's Dairyman and farm bulletins and practicing up-to-date methods of keeping cows are the ones who have the big cream checks.—G. E. Ronne.

Richland Center, Wis.: A co-operative creamery has been started. First payment on butterfat was 42c and for the first part of September 40½c. In August and September market milk sold for $4.70 per cwt. The con-

densery paid 37c per lb. for fat, the cheese factory 38c.—S. Lambie.

Cedarburg—Grafton, Wis.: Two herds were tested for tuberculosis and no reactors found. Twenty out of 25 herds in this association are now under state and federal supervision. The Ozaukee County Holstein breeders will hold a sale October 1st. Market milk sold for $2.32 per cwt. The cheese factory paid 42c per lb. for fat, the creamery 44c in September.—G. Wild.

Cow Testing in Missouri

Last year the cows in Missouri cow testing associations that averaged 300 lbs. of butterfat per cow produced butterfat at a cost of about 19 cents per pound. At the same time the average Missouri cow with a production of about 120 lbs. of butter, made this production at an average cost of about 41 cents per pound.

One of the best evidences of the increasing popularity of this work with dairymen is the rapid increase in cow testing association work in Missouri. In 1919 there were two associations with 48 members. Today there are fifteen associations with 370 members. Ten more associations are ready to organize as soon as testers can be located. In 1919 the association members received an average of $2.17 worth of product for every dollar feed cost. In 1923 this had increased to $2.77. This increase of sixty cents in profit on each dollar feed cost represents $35.12 per cow. Could this same increase have been realized on all of the 800,000 milk cows in Missouri it would have amounted to over $28,000,000 increase in profit to Missouri dairymen.—E. M. Harmon.

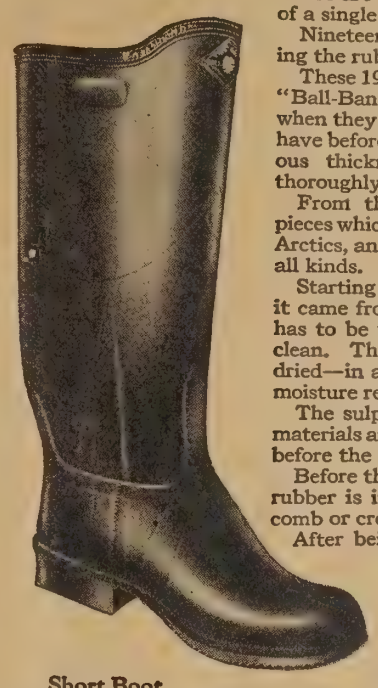
South Eaton, Michigan, Report

The South Eaton County, Michigan, Cow Testing Association has completed its second year. The summary report shows that 234 cows completed the association year, averaging 286.7 pounds fat and 7,654 pounds milk.

Mr. C. E. Burke carried off all honors. His seven pure-bred Holstein cows averaged 14,472 pounds milk and 513.6 pounds fat, the highest in the entire association for both milk and fat. A four-year-old pure-bred Holstein in Mr. Burke's herd produced 623 pounds fat and a stable mate to this cow produced 17,463 pounds milk and 549 pounds fat. These cows, respectively, are high in butterfat and milk production for this association.

A number of herds made improvements over the preceding year's work. In one instance a ration of 200 pounds ground oats, 100 pounds corn and cob meal, 200 pounds culled beans, 100 pounds bran, and 100 pounds cottonseed meal helped bring greater returns and make a dairy herd a good investment. This ration was fed at the suggestion of the tester. Other herds were fed cooked or ground culled beans and the cost of production was thereby cut. The experience of the South Eaton members indicates that from two to three pounds of ground beans daily per cow is desirable. Cooked culled beans, from 18 to 24 pounds, brought good results. In several cases this quantity of cooked culled beans was fed with silage. Additionally, corn and oats should be fed in order to maintain the cows in good flesh.

H. Kardel, Tester.



THE HOLSTEIN HERD OF C. E. BURKE AVERAGED 14,472 LBS. MILK, 513.6 LBS. FAT IN SOUTH EATON COUNTY, MICHIGAN, C. T. A. AND IS HIGHEST IN MILK AND FAT IN THIS ASSOCIATION

Illinois Association's Report

The Crawford County Cow Testing Association has just completed its first year with 588 cows tested; 279 cows finished the year with an average production of 4,615 lbs. milk, 247.9 lbs. fat, costing $1.04 to produce 100 lbs. milk, 21.2 cents to produce a pound of fat. A pure-bred Jersey cow, Fern Belle Star, was highest cow for the year, in amount of fat, her production being 9,367 lbs. milk and 548.3 lbs. fat. She is owned by E. E. Pifer. The high herd, consisting of 12 grade Guernseys and Jerseys, produced 6,709 lbs. milk containing 346.1 lbs. fat. Cost to produce 100 lbs. milk was $1.04; fat, 19.4 cents. This herd is owned by R. C. Lindley. The low herd of the association averaged 2,889 lbs. milk and 144.7 lbs. fat. It cost this herd $1.96 to produce 100 lbs. milk and 39 cents for fat. Two cows produced over 10,000 lbs. milk and 8 cows over 400 lbs. fat. All members but one use pure-bred sires. Two members use milking machines. Eight herds are federally accredited, 17 herds have had one or more tests. No reactors were found.—Fred C. Schroeder, Tester.

Over Fifty Reasons for MORE DAYS WEAR In "Ball-Band" Rubber Footwear

Short Boot
Extra strength where strength is needed to withstand the strains of work and wear.

There are 61 operations in the making of a single "Ball-Band" boot.

Nineteen of these are simply preparing the rubber and cloth.

These 19 operations take place for all "Ball-Band" Rubber Footwear and when they are completed the workmen have before them rubber sheets of various thicknesses and rolls of cloth thoroughly impregnated with rubber.

From these they cut the pattern pieces which will be built up into Boots, Arctics, and other Rubber Footwear of all kinds.

Starting with the raw rubber just as it came from the East Indies—first it has to be washed until it is perfectly clean. Then it is dried—thoroughly dried—in a kiln so that not a trace of moisture remains.

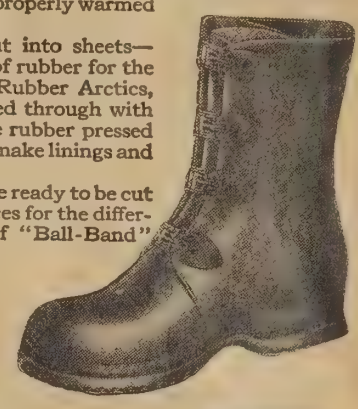
The sulphur and all the other raw materials and even the cloth—are dried before the work on the rubber begins.

Before the grinding process, the raw rubber is in sheets and has a honeycomb or crepe appearance.

After being washed and dried it is run through rollers again and again until it is a solid mass of gum, all the air spaces and crinkly surfaces being kneaded out of it.

It is then cut into loaves carefully weighed.

The sulphur and other compounding materials are also weighed into portions just right for each loaf or lump of raw rubber.



Then the rubber is kneaded again between rollers while the compound is added and thoroughly mixed.

After this it is run through hot rollers until the whole mass is properly warmed and softened.

It is then rolled out into sheets—some of it into sheets of rubber for the outside of Boots, All-Rubber Arctics, etc. Some of it is rolled through with sheets of cloth and the rubber pressed right into the fabric to make linings and reinforcements.

Now the materials are ready to be cut up into the various pieces for the different styles and sizes of "Ball-Band" Rubber Footwear.

4-Buckle All-Rubber Excluder Arctic

After This the Real Work of Bootmaking Begins

In a single "Ball-Band" "Vac" Boot there are 36 parts and 42 operations following the 19 already described. In a 4-buckle Cloth Arctic there are 50 parts and 30 additional operations. In a 4-buckle Rubber Arctic there are 60 parts and 33 additional operations.

Over Fifty Reasons for More Days Wear

Just a little better in every one of 50 operations means a whole lot better in the completed boot or rubber.

Over Ten Million people buy and wear "Ball-Band" Rubber and Woolen Footwear because they know what results have told them. They know the wear; they know the comfort and they know the economy.

And the reasons—over 50 of them—are all because:

We make nothing but footwear and we know how

Look for the RED BALL

Look for the Red Ball. It is on every pair of "Ball-Band" Rubber and Woolen Footwear. If your dealer does not handle "Ball-Band" write for dealer's name and the free booklet, "More Days Wear." It shows many kinds of Boots, Arctics, Light Rubbers, Work Shoes, Sport Shoes, Wool Boots and Socks—something for every member of the family.

MISHAWAKA RUBBER & WOOLEN MFG. CO.

"The House that Pays Millions for Quality"

"BALL (TRADE Red Ball MARK) BAND" Rubber & Woolen FOOTWEAR

Mishko Sole Letho Shoe

The Letho Shoe has a "Ball-Band" sole made of special compound. This Mishko Sole is not only waterproof but wearers find it is stronger than leather and tougher than rubber. The upper is of full-grain leather, soft, pliable and durable.

This shoe is highly recommended by wearers as the most economical work shoe made. It is giving unusual satisfaction to men and boys who are "hard on shoes."

And, best of all, it is comfortable. Workers who are on their feet all day say they never think of their shoes when they are wearing this "Ball-Band" work shoe.

Imported Melotte

with the *self-balancing* bowl. Positively cannot get out of balance therefore cannot vibrate. Can't remix cream with milk. Runs so easily, bowl spins *25 minutes* after you stop cranking unless you apply brake.

DAIRY MARKET NEWS

Butter Prices for September

The following table is compiled from daily quotations by the U. S. Department of Agriculture and covers the average wholesale prices during September on 92-score butter (extras) at four of the principal markets, together with the receipts and storage holdings at these markets:

	Ave. price		Receipts	
	Sept. 1924	Sept. 1923	Sept. 1924	Sept. 1923
	Cts.	Cts.	Tubs	Tubs
Chicago	36.7	45.7	258,039	228,156
New York	37.9	46.0	300,427	272,128
Boston	38.3	44.6	103,818	97,528
Philadelphia	38.8	47.0	76,557	73,769
Total receipts for Sept.			738,841	671,581
Total receipts since Jan. 1			7,492,453	6,856,542
Storage holdings			1,354,050	787,773

Ninety-score butter averaged 34.9 cents for September in Chicago, with centralized butter at this market selling for 35.3 cents. Jobbers' prices on extras sold to retailers averaged 39.2 cents in Chicago and 41.4 cents in New York.

Cheese Prices for September

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese (style Twins) for the two large markets in September:

	September Ave. price	
	1924	1923
	Cts.	Cts.
Wisconsin Boards	19.3	24.7
Chicago	19.8	24.1

Longhorns averaged 20.3 cents in September on the Wisconsin Boards as compared with 19.3 cents in August and 26.2 cents in September a year ago. The receipts of cheese at Chicago, New York, Boston, and Philadelphia totaled 158,561,694 lbs. for the first nine months of the year as compared with 160,858,910 lbs. for the same period last year. Storage holdings at these markets on Oct. 1 were 23,602,104 lbs. as compared with 21,507,113 lbs. a year ago.

Milwaukee September Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of September:

For that portion sold as fluid milk, $2.85 per cwt; and for the portion manufactured, $1.39 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Seventy per cent of the total receipts were sold as fluid.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets steady to firm during week ending Oct. 4th. Somewhat better feeling on markets due to export outlook. Further small shipments have been made. Production is decreasing somewhat but still heavy compared with last year. Storage withdrawal fairly heavy.

The average wholesale prices on 92-score butter for the week ending Oct. 4, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending		
	Oct. 4 1924	Sept. 27 1924	Oct. 4 1923
	Cts.	Cts.	Cts.
New York	38.5	37.4	46.8
Chicago	36.5	35.5	46.0
Philadelphia	39.3	38.2	47.8
Boston	38.2	37.5	47.2
San Francisco	39.0	37.2	47.9

The receipts of butter at these markets were 13,289,001 lbs. for the week as compared with 12,784,086 lbs. for last week and 10,912,155 lbs. a year ago.

Wisconsin August Butter

(Wisconsin Department of Markets)

The following is an average report of the operations of 138 co-operative creameries in Wisconsin for the month of August, 1924:

No. of creameries	Price paid for fat	Av. price rec'd. for butter	Ave. overrun	Ave. amt. fat rec'd.
	cents	cents	%	lbs.
1	46	42.6	20.0	17,818
7	44	36.3	23.2	54,950
19	43	37.1	23.4	42,170
23	42	36.6	23.6	30,494
31	41	36.6	23.1	30,884
26	40	36.5	22.5	30,270
12	39	36.6	23.1	21,952
5	38	35.9	21.7	20,285
9	37	35.9	21.7	14,368
4	36	35.3	24.6	7,381
1	35	35.	22.5	5,706
138				25,116

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets weakened during the week resulting in declines of about 1½c on Wisconsin Cheese Boards. Buying has been on a cautious basis and not much beyond immediate needs.

The average wholesale prices on American cheese, style Twins, for the week ending Oct. 4, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending		
	Oct. 4 1924	Sept. 27 1924	Oct. 4 1923
	Cts.	Cts.	Cts.
New York	21.8	22.0	26.7
Chicago	19.8	20.1	25.2
Boston	22.0	21.8	27.2
San Francisco	18.6	18.3	27.4
Wisconsin Boards	20.0	20.5	25.6

The receipts of cheese at these markets were 3,988,332 lbs. for the week as compared with 4,542,606 lbs. last week and 4,627,521 lbs. a year ago.

Philadelphia Milk Prices

The Interstate Milk Producers' Association announces that the October price for milk will be $2.94 a hundred f. o. b. Philadelphia and $2.19 a hundred at the 210-mile zone. This applies to the basic quantity. For September class 1 surplus, producers will receive $1.97 per hundred f. o. b. Philadelphia and $1.39 per hundred at the 210-mile zone. These prices are based on milk testing 3 per cent fat with a differential of 2 cents for each half point of test.

September Prices at Wisconsin Condenseries

(Wisconsin Department of Markets)

The following table gives the prices paid for milk delivered at Wisconsin condenseries during September. Some of the plants on this list are not strictly condenseries as they make a practice of bottling part or nearly all of their milk; prices paid by such plants usually run higher than those paid by straight condenseries. If prices for the current month are not available the price for the preceding month is given:

City	Prices to producers per 100 lbs.	Test basis payment	Price paid for 3.5% milk
Berlin	$1.75	4.	$1.53
Black Creek	1.75	4.	1.53
Bloomer	1.77½	4.	1.55½
Brooklyn	2.60	3.5	2.60

If you know of a thing that will darken the joy
Of a man or a woman, a girl or boy,
That will wipe out a smile or the least way annoy
A fellow or cause any gladness to cloy,
It's a pretty good plan to forget it.

Ayrshire Awards at the National

Bull, 4 yrs. old or over—1, Seitz & Sons on Cavalier's Ping Pong; 2, Alta Crest Farms on Bargenoch Masterstroke Imp.; 3, J. L. Stansell on Robin Hood; 4, Ness & Sons on Netherall Excelsior; 5, Betts & Sons on Elizabeth's Crusader. Bull, 3 yrs. old and under 4—1, Deschamps on Major de St. Sulpice; 2, Wallis on Cavalier's Bobby Vernon; 3, Ayrcroft Farm on Ayrcroft Cavalier Goldfinder. Bull, 2 yrs. old and under 3—1, Wallis on Edgerstoune's Premium Bond; 2, Seitz & Sons on Cavalier's Sherry Redman; 3, Barclay Farms on Barclay's Front Line; 4, Nisbet on Alta Crest Maintsay; 5, Experimental Farms on Ottawa Lord Kyle 2d. Bull 18 mos. and under 2 yrs. old—1, Barclay Farms on Strathglass Roamer; 2, Mass. Agrl. College on Alta Crest Ringleader; 3, Monstone Farm on Monstone Pilgrim; 4, Fraser on Burnside Knight Errant; 5, Hanrahan, Jr., on Ace of Hearts. Bull, 1 yr. and under 18 mos.—1, Alta Crest on Alta Crest Happy-Go-Lucky; 2, Pearson & Sons on Alta Crest Militant; 3, Seitz & Sons on Cavalier's Golden Pippin; 4, Ayrcroft Farms on Ayrcroft Cavalier Lord; 5, Barclay Farms on Barclay's Footlight. Bull calf, 4 mos and under 1 yr.—1, Ness & Sons on Burnside Supreme Victory; 2 and 5, Alta Crest on Alta Crest Weather Vane and Alta Crest Play Safe; 3 and 4, Seitz & Sons on Cavalier's Field General and S. C. Fashion Plate.

Cow, 5 yrs. old or over—1 and 4, Seitz & Sons on S. F. Helen R. and Lucindy of S. C. 4th; 2, Experimental Farms on Belle of Oban; 3, Monstone Farm on Hilltop August Lassie; 5, Legare & Sons on Primerose de la Petite Riviere. Cow, 4 yrs. old and under 5—1, Seitz & Sons on Cavalier's Luxury; 2, Woronoake Farms on Woronoake Pearl; 3, Experimental Farms on Ottawa Dignity Dot; 4, Barclay Farms on Nedloh Dairy Maid; 5, Alta Crest on Netherton Carmen Imp. Cow, 3 yrs. old and under 4—1, Ness & Sons on Burnside Blossom Andrietta; 2, Experimental Farms on Dunlop Stellite Imp.; 3 and 5, Seitz & Sons on Cavalier's Leesie Lindsay and Cavalier's Kathleen; 4, MacDonald College on Macdonald Holly 2nd. Heifer, 2 yrs. old and under 3 1, Alta Crest on Alta Crest Powder Puff; 2, Ohio State University on Maud Mac 7th; 3, Ness & Sons on Burnside Janevic; 4, Kemptville Agr'l School on Kemptville A. S. Frances; 5, Ness on Monstone September Morn. Heifer, 18 mos. old and under 2 yrs., bred by exhibitor; 1, Barclay Farms on Barclay's Brown Betty; 2, Seitz & Sons on Cavalier's Queen of Diamonds; 3, Hume & Co. on Humeshaugh Perfect Kate; 4, Alta Crest on Alta Crest Bright Lass; 5, Experimental Farms on Ottawa Barbara. Heifer not in milk, 1 yr. old and under 18 mos., bred by exhibitor—1, Barclay Farms on Barclay's White Flower; 2, Cummings Bros. on Supreme Elsie; 3, Seitz & Sons on Cavalier's Darling; 4, Alta Crest on Alta Crest Silk Stockings; 5, Ness & Sons on Burnside Heatherbloom. Heifer calf, 4 mos. old and under 1 yr., bred by exhibitor—1 and 4, Alta Crest on Alta Crest Hillbrow and Alta Crest Bubbles; 2, Ness & Sons on Burnside Miss America; 3, Seitz & Sons on Cavalier's Lady Perfection; 5, Barclay Farms on Barclay's White Betty (twin).

Cow, 4 yrs. old or over, having official yearly record—1 and 2, Seitz & Sons on S. F. Helen R. and Lucindy of S. C. 4th; 3, Legare & Sons on Primerose de la Petite Riviere; 4, Wallis on Lucindy of Spring Castle 2nd; 5, Ayrcroft Farm on Willowmoor Elsie Ruth. Cow, under 4 yrs. old, having official yearly record—1, Ness & Sons on Burnside Blossom Andrietta; 2, 3, and 4, Seitz & Sons on Cavalier's Leesie Lindsay, Cavalier's Kathleen, and Barclay's Lady Beauty. A. R. cow—1, Seitz & Sons; 2, Barclay Farms on Barclay's Jessie D; 3, Alta Crest Farms; 4, Ayrcroft Farm on Ayrcroft Nancy. Get of sire—1, Seitz & Sons on get of Cavalier's Lord Rosebery; 2, Barclay Farms on get of Nether Craig Footline; 3, Ness & Sons on get of Hobsland Victory; 4 and 5, Alta Crest on get of Morton Main's Lord Barrylyndon Imp. and Lessnessock Searchlight Imp. Produce of cow—1, Wallis on produce of Lucindy of Spring Castle; 2 and 3, Experimental Farms on produce of Culgaigrie Dot Imp. and Bargenoch Gay Cavalier's Leesie Lindsay 2nd of S. C.; 4, Seitz & sons on produce of Bargenoch Gay Cavalier's Queen of S. C.; 5, Barclay Farms on produce of Barclay's Jessie D. Exhibitor's herd—1 and 5, Seitz & Sons; 2, Alta Crest Farm; 3, Ness & Sons; 4, Barclay Farms. Breeder's young herd—1, Alta Crest Farms; 2, Ness & Sons; 3, Barclay Farms; 4 and 5, Seitz & Sons. Dairy herd—1, Seitz & Sons; 2, Experimental Farms; 3, Alta Crest Farms; 4, Ness & Sons; 5, Ayrcroft Farm. Eight animals entered by a state breeders' association—1, Ontario Ayrshire Breeders' Ass'n.; 2, Quebec Ayrshire Breeders' Association; 3, Wis. Ayrshire Breeders' Ass'n.; 4, Mass. Ayrshire Breeders' Ass'n.; 5, Ohio Ayrshire Breeders' Ass'n.

Senior champion bull—Cavalier's Ping Pong. Junior and grand champion bull—Strathglass Roamer.

Senior and grand champion cow—S. F. Helen R. Junior champion cow—Alta Crest Hillbrow.

Says Sam: Friction makes some wheels go around, but not the wheels of life.

Amarillo Fair

HOARD'S DAIRYMAN:—A new dairy show and a new fair, ranking among the best in the Southwest in quantity and quality of exhibits, in size of premiums, in buildings, and in extent of territory actively interested, made its appearance here the week of Sept. 22—28 with the second annual showing of the Amarillo Tri-State Exposition.

This fair, founded to advance the live stock and agricultural interests of a territory larger than most states, held its first show in 1923, in temporary quarters. It is centrally located in its territory, in the largest city of the region and with no major fair within 275 miles. During the last year, a 100-acre tract has been purchased for permanent quarters, and eight exhibit buildings erected. The extent of the territory from which support is drawn is indicated by the fact that 28 counties sent agricultural exhibits.

The dairy show was characterized as one of the best they had ever entered by Professor George P. Grout of Texas A. & M. College, J. W. Ridgway, and other veteran exhibitors. This was especially true of the Jerseys, whose advocates have been the pioneers in this virgin territory.

Sixteen exhibitors participated in the premium money, with Texas A. & M. College, Tarrant County Breeders' Association, and the Swisher County Bull Circle sending large herds. This latter organization has been a leader in bringing high grade stock to the region and, as a result, butterfat production of the county has jumped from $150,000 to $350,000 annually within a short time. A number of other communities are beginning to follow the Swisher County example.

Championships were awarded as follows:

Jerseys—Senior and grand champion bull, Texas A. & M. College on Raleigh's Sultan of Lehigh; junior champion bull, Tarrant County Breeders' Association on Mistletoe Cid's Raleigh; senior and grand champion cow, Texas A. & M. College on College Gamboge's Jacoba; junior champion cow, Tarrant County Breeders' Association on Anna's Lad Fern.

Holsteins—Senior and grand champion bull, Texas A. & M. College on Grahamholm Dutchland Colantha; junior champion bull, Texas A. & M. College on Nudine Tidy Prince; senior champion cow, Mrs. B. W. Trice, Oklahoma, on Bostwick's Pietertje Peggy; junior and grand champion cow, Texas A. & M. College on Tidy Princess Sunlight.

Guernseys—Senior and grand champion bull, Texas A. & M. College on Kitchener's Defiance Iowanola; senior and grand champion cow, Texas A. & M. College on Moonlight Cornet of Jaun.

Texas. H. E. BOZEMAN.

Ice Cream Short Course

Several experts from commercial companies will assist University of Minnesota dairy division men in putting on the ice cream makers' short course at University Farm, St. Paul, November 17 to 26.

Seconding Professor W. B. Combs, who will be in personal charge of the course, will be R. M. Washburn, director of laboratories for the International Dry Milk Company of Minneapolis. Mr. Washburn has been in dairy work for more than 30 years.

J. F. Raether, refrigerating engineer of the Westerlin & Campbell company, will teach the principles of mechanical refrigeration at the course. Two other experts, E. O. Hanson and J. O. Larsen, both of the Vander Bie Ice Cream Company, will lecture on sales and keeping records.

The course will consist of 32 lectures and 8 laboratory periods. Professor Harold Macy of the University's dairy division will handle the broad subject of bacteriology and give demonstrations in the normal fermentations of milk. H. C. Moore and L. M. Thurston of the faculty will assist in the laboratory periods and Professor Moore will give demonstrations in the judging of gelatines. While the course is primarily for those who have had some practice and experience in making ice cream, it will be so handled that those without experience may enter. Persons expecting to attend should write at once to the Division of Dairy Husbandry, University Farm, St. Paul, Minn., for application form.

Imp. Togo's Ginger. A non-producer at 12 yrs. of age. Murphy's Minerals were added to her ration and she produced 561 lbs. butter fat the next year.

"She was headed for the block as a non-producer"

Don't send that cow to the block! Murphy's Minerals saved thousands of cows last year from being sold as cheap canners.

Minerals are what their systems crave. They are mineral starved from high pressure concentrates and low mineral roughages. They have robbed their own systems to supply the minerals for their calves and milk until nature refuses to do more and a breakdown follows.

Murphy's Mineral Feed acts directly to increase *production*, prevent *goitre* and *depraved appetite*, and reduce *abortion* and *sterility*. It supplies to the animal the proper minerals in a concentrated, highly digestible, perfectly balanced form.

Written Binding Guarantee

Murphy's contains *no* indigestible ingredients—*no* agricultural limestone, *no* rock phosphate, *no* filler, *no* drugs, *no* medicine. It is palatable. With it even healthy herds increase their milk yield sufficient to pay several times its cost.

Murphy's is the only mineral feed sold on a *written, absolute, binding guarantee* of satisfaction or your money refunded. Write for book showing the true value of mineral feeds and how to judge them. It is Free. Simply address: MURPHY PRODUCTS CO., 110 8th St., Delavan, Wis.

MURPHY'S MINERALS

Wisconsin Dairy Show Holstein Sale

The Wisconsin Dairy Show Sale held Oct. 6 at Waukesha, Wis., did not bring out the buyers anticipated and some good cattle went for lower prices than expected. Eighty-four head sold for $19,725, an average of $234 each, with bulls selling to somewhat better advantage than females.

Top price, $710, was paid by Carl E. Rudolph of Illinois for Sir De Kol Ollie, a 27-lb. prize winning grandson of Iowana Sir Ollie, consigned by Heck Bros. He was a very showy two-year-old and unquestionably individuality was a big factor in his selling at the top of the sale.

The heaviest buyer at the sale was G. M. Householder, a member of the State Board of Control, buying for the state institutions. He took 32 head, with many of the best in the sale among them.

Mack, Krause, and Blake did the selling with Wood in the box. F. H. Everson managed the sale:

Following is a list of those animals selling for $250 or more and buyers:

Wisconsin State Board of Control	
King Pontiac Champion Parthenea	$625
Korndyke Pontiac De Kol Rue 5th	310
Johanna Segis Longfield 2nd	360
Hollyhock Bess Colantha Lady	385
Hollyhock Colantha Bess Ormsby	475
Hollyhock Pietertje Ollie Ormsby	500
Hollyhock Bess Colantha Fobes	325
Queen Johanna of Enterprise	550
Sedgland Homestead Beryl Wayne	460
Carl E. Rudolph, Illinois	
Sir De Kol Ollie	$710
D. W. Norris, Wisconsin	
Pabst Creator Maplecrest Ivy	$425
Johanna Copia Korndyke	375
O. & M. College, Oklahoma	
Sir Ormsby Segis Piebe	$410
George Hetzel, Wisconsin	
Ideala Korndyke Hengerveld	340
Joe Subitch, Wisconsin	
Nockdair Superba Segis Flower	$300
Carnation Matador Fobes De Kol	305
F. E. Klussendorf, Wisconsin	
Huldah Segis Korada	$425
Geo. Barty, Wisconsin	
Sir Johanna Pauline Ormsby	$475
H. F. Schimmel, Wisconsin	
Tomah Johanna Pietertje	$275
Fred Wittwer, Wisconsin	
Bertina Johanna McKinley Lass	$350
Axel Nissen, Wisconsin	
Male No. 42	$270
Wm. Harley Williams, Wisconsin	
Belle Neeltje Pontiac	$350
J. A. Hurtgen, Wisconsin	
M. M. Rue Bess Burke Ormsby	$275
Joe H. Hill Co., Indiana	
Carnation Matador Setske	$390
Carnation Matador Johanna	450
E. J. Jensen, Wisconsin	
Aggie Denver Wayne	$255
Massey Bros., Illinois	
Prospect Duke	$625

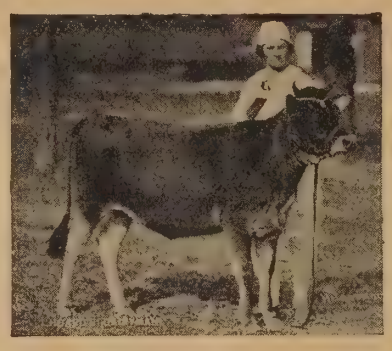
HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

With the Juniors at the National

DEAR JUNIORS:—I sure had a good time at the National Dairy Show Club camp in Milwaukee. I guess everybody there had a great time. I don't see how they could help it with "Mac" McNeel in charge of the camp. He sure is a jolly good scout. He keeps camp in apple pie order and everybody smiling. I was at the National a whole week. Met a lot of fine fellows—and some dandy girls, too.

"THE BIG TRIUMVIRATE"



Top—Beth Salter, ass't. state club leader, Wisconsin. Bottom—W. McNeel, camp director; T. L. Bewick, superintendent boys' and girls' department at the National Dairy Show.

Well, let's see. Where'll I begin? Suppose I better begin at the beginning so here goes. When I entered the club building on the Fair Grounds—and by the way, it was the grandstand — Saturday morning, September 27, right away I bumped into a quartette of old friends, club leaders all. Who were they? It's no secret and as I want you to meet them, for they're regular fellows, I'll introduce them right away. The first is E. G. Jenkins, state club leader from Maryland, Daddy Jenks we all call him. Next is T. A. Erickson, the big club boy and chief of Minnesota's clubland, and there was G. L. Herrington, Tennessee club leader, a right good songmaster and yell leader and famous for his "Then let the lion roar!" There, just going into the telephone booth, was "Mac"—bet he was ordering something for dinner. And down the incline stairway came T. L. Bewick, Wisconsin's club mogul, and superintendent of the club department at the National Dairy Show. We shook hands all around and chatted for awhile.

I was going up to the second floor to see how things looked when my attention was drawn by curious noises on the other side of the partition scarce more than a rod away. Of course I had to investigate, and what do you suppose I found? The major part of the ground floor of the grandstand had been turned into a calf barn. So naturally I took a good look around going up behind one row of calves and down behind the next, and so on until I had viewed a most excellent exhibit of club calves of all the five dairy breeds. Besides, I had met some old friends looking after their animals, and met one or two new ones.

Before I knew it, the noon hour had arrived. So I hied myself up to the second floor of the 4-H club home. Now the last time I had been on the Wisconsin State Fair Grounds was about a month previous and this fine building had then been used to house the splendid club exhibits. The second floor had been filled with hundreds of club exhibits. I was therefore a little surprised to discover a kitchen and dining room and recreation hall occupying this space—it was a little different. And half the hall had been partitioned off with canvas, and I soon learned that this part had been turned into sleeping quarters for the boys. I peeked under the curtain and saw long rows of cots backed up against the glass exhibit cases.

This being the main hang-out for the club boys and girls during the week—don't they like to eat though—I shook hands with a number of "clubbers", Beth Salter, Wisconsin's assistant state club leader and in charge of the girls at the National Dairy Show, Miss Vangel Russell and Charlie Mac Aleavey, coaches of Wisconsin's dairy demonstration team, Miss Mary Brady who trained a championship demonstration team for Wisconsin last year, Ruby Maas and her team mates on the Wisconsin dairy demonstration team. Of course, I went over to the kitchen and said "hello" to the cooks because I wanted to be sure to stand in well with them. Anyhow, Ernie Hausen—you remember the world's champion poultry picker, don't you, is a particular friend of mine. And they don't make better cooks than Mrs. George Mason. I had scarcely made the rounds when I looked up to see Barbara Luchsinger coming towards me. Gee, but I was surprised. You know why? Barbara lives in Syracuse, New York. I met her last year at the National Dairy Show. Milwaukee sure is quite a ways from Syracuse and besides Barbara told me last year that she was going to the city to work. However, she informed me that she had been needed too badly at home to leave, but that she had had unusual success with her Jersey heifer, having won championship on her at the New York State Fair. Good for Barbara! Nor was her glory to stop here, as you shall see later. By the way, she is a Hoard's Dairyman Junior.

BARBARA LUCHSINGER, NEW YORK, WITH HER SWEEPSTAKES JERSEY

ROBERT SEITZ, CHAMPION SHOWMAN

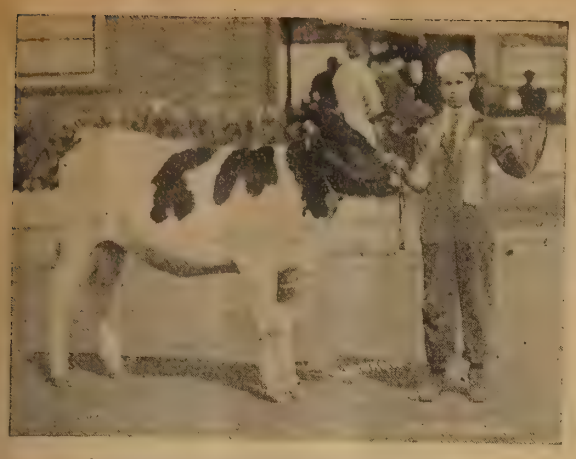
The sharp blast of the leader's whistle interrupted us. Mac was blowing the first call for dinner. I hiked up to wash on the third floor. Up there I found more cots for tired club boys. Dinner was good—all the meals were above par. I discovered that scarcely half the camp had arrived yet. I sat at the same table with Verlyn Sears, leader of the Clark County calf club boys, but more familiarly known to you as one of the men who posed for the picture page on Fitting the Dairy Calf for the Show Ring. There were also several Badger State boys whom I had called on at their homes—John D. Wuethrich and Ernie Christie, for instance. The camp being held in Wisconsin it was only natural that I should meet these people first. Some general announcements were given by Mac after the meal, the most welcome of which was the one which said that for the present the members would not have to wash dishes. Just as we were getting up from the table Maryland came in—the judging team of three boys and their coach, Mr. Derrick.

JUDGING DAY AT THE JUNIOR NATIONAL

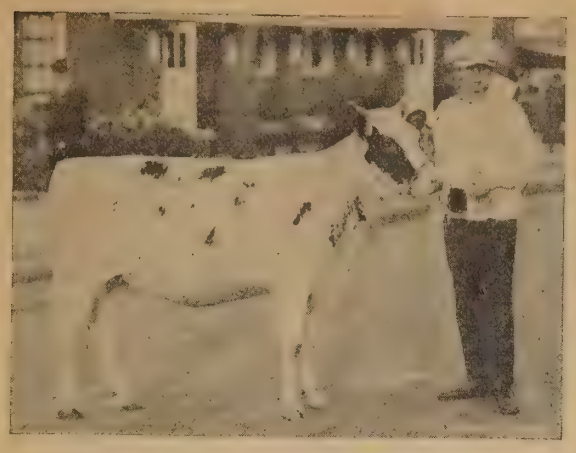
This was the largest class led into the ring—Holstein heifers. The "club home" is in the background.

I will not attempt to go into detail about each day's program, but I know you are all interested in a few

HOW'S THIS FOR A JOLLY GANG OF CLUBBERS?



Two hundred boys, girls, and leaders on this picture, as many as could be gotten together at one time.



EVEN A CHAMPION WASHES DISHES

Harlan Leonard, highest individual in the judging contest, and Eunice Horne. No wonder Harlan washes.

MARPLE MOUNTAIN, IOWA, AND CHERUB'S BEUTONA OF IOWANOLA, SWEEPSTAKES GUERNSEY

of the high lights, so I will give you sort of an outline with here and there a bit of detail thrown in.

Saturday afternoon marked the first appearance of the 4-H Dairyland S'News. Although I had not seen him, I knew by the paper that Guy L. Noble, secretary of the National Committee on Boys' and Girls' Club Work, was on the job. He always fills his issues with cartoons and caricatures of which he himself is the author, and real live news written in an interesting fashion. The first issue contained an announcement of the opening of the camp, the big parade, and gave the entire program for the week, also carried a feature on Who's Who in the 4-H department. This camp newspaper was published daily for the dairy calf club members and was much appreciated by everyone.

Sunday was a quiet day in camp. In the morning the boys and girls attended church; in the afternoon they visited the Washington Park Zoo. The S'News reported that H. B. Derrick from Maryland got lost but was later found in a cage perfectly safe. In the evening Dr. W. T. Dorward gave a delightful talk. Dr. Dorward is Scotch and a Baptist minister. His first talk was so much enjoyed that he delivered a second one entitled "The Master Key" at the clubber's banquet Tuesday night. Saturday night and all day Sunday club members continued to pour into camp.

When I arrived at the grounds Monday morning things were rather quiet around camp, but I thought I knew the reason, so I went up to the coliseum. Sure enough, there they were in the ring. The contest was on. It was junior cattle judges' day. All morning they labored, first placing in the ring then giving oral reasons. They had to give their judgments on different classes in nearly all breeds. It was a hard job, but they had been drilled thoroughly and were ready. Twenty states were represented by junior teams in this contest, including the following: North Dakota, Illinois, West Virginia, Ohio, Georgia, Tennessee, New York, Wisconsin, Nebraska, Minnesota, Michigan, South Dakota, Iowa, Indiana, Pennsylvania, Missouri, Maryland, Vermont, Kansas, and Connecticut.

It was during the noon hour when the contest ended. The juvenile judges returned to headquarters after the regular campers had finished the noon meal. While they were waiting for the cooks to hustle their food on the table for them, L. I. Frisbie, Nebraska state club leader, who was in charge of the judging contest, stood up on a bench and announced the official placings of the various classes. The contestants anxiously compared their placings with those given by Mr. Frisbie. Final results, however, were not announced until the next evening at the annual banquet.

CLUB LEADERS FROM FAR AND NEAR AT THE NATIONAL

Bottom row, left to right: Mr. and Mrs. G. L. Herrington, L. I. Frisbie, M. J. Regan (Missouri), E. L. Austin, T. L. Bewick. Second row—C. Mac Aleavey, T. A. Erickson, W. McNeel, V. B. Sheldon and E. L. Garret (Mo.), J. A. Simms (Conn.), Beth Salter, Conie Foote (Kans.), and Mrs. G. B. Meybohn (Minn.). Third row—L. E. Hemrick (Ga.), Joe Flint (Mo.), H. A. Hass (Minn.), F. C. Essick (Mich.), D. P. Hughes (Wis.), L. H. Matthias, E. C. Sackrider, Art Hagen, and Paul Banker (all of Mich.). Fourth row—L. H. Marlatt and F. W. Fitch (Ga.), F. L. Miles (W. Va.), H. B. Derrick (Md.), C. H. Willson (N. Dak.), Otto Gilmore (Mich.), Russell Clarke (Wis.). Top row—Frank E. Miller and Mrs. Eli Young (S. Dak.), Vangel Russell, S. S. Mathison.

According to the Monday edition of the S'News, more than 250 boys and girls and leaders from twenty-one different states had registered at headquarters. It certainly was fine that practically the entire junior dairy show could be housed in such a splendid building as the grandstand. I heard it said that the best spirit prevailed at this camp of any previous, and I feel that it was due in a good measure to the fact that the accommodations kept them in one central unit. Before the camp had ended nearly 400 club members and leaders had registered. Naturally the girls were in the minority. I think there were about 50 girls there all told. Sleeping quarters were provided for them in a nearby building.

The first of the week, a number of trip winners arrived. For instance, there was a party of forty boys and girls, calf club champions in as many counties in Minnesota, directed by David S. Owen of the Minneapolis Journal. This enterprising big newspaper awarded the trip. Then there was a party of about 15 boys and girls from several states who were guests of the Blue Valley Creamery Co. And say, I almost forgot to tell you that one of the contestants in judging was Austin Lathrop of Connecticut. I met Austin last year at Syracuse; he was an alternate on the judging team there. He is and has been for several years a Hoard's Dairyman Junior of whom we have been particularly proud. His leader told me that Austin was making a name for himself in high school as debator and manager of the high school annual. Good work, Austin.

On Tuesday morning, promptly at 9:30, New York opened the demonstration team contest in which sixteen champion state teams competed for top honors. This contest was held in the entrance to the grandstand on the ground floor and attracted large crowds all the time. It was under the management of T. A. Erickson, Minnesota. Believe me, the demonstrations were good and many visitors left with more knowledge than when they first sat down to listen. E. L. Austin, Indiana state club leader, judged the demonstrations which continued all day Wednesday and part of Thursday. On Tuesday also the educational trips began. All those not otherwise engaged were taken down town to view the sights. After the noon meal, Mr. Frisbie announced that health contestants would be examined to determine the healthiest boy and girl in dairyland.

I forgot to mention that on Monday evening the clubbers were guests of the Milwaukee Kiwanians at the Rialto Theatre where "The Covered Wagon" was being shown. Needless to say, the kids were much tickled. Thanks, Kiwanians.

But of course the biggest event was scheduled for Tuesday evening—none else than the annual banquet. Contrary to the usual custom, supper was scheduled for 6:30. Nobody minded the extra wait because the cooks had an excellent chicken dinner prepared. I guess that the cooks probably fed as many at the banquet as at any time during the week. While waiting for dinner I bumped into a
